CONIC SECTIONS.

CONIC SECTIONS are the figures formed by cutting a cone by a plane. They are five in number corresponding to the different positions of the cutting plane; viz. a Triangle, a Circle, an Ellipse, a Parabola, and an Hyperbola. The last three of these only are peculiarly called conic sections. The more ancient mathematicians, before the time of Apollonius Pergæus, admitted only the right cone into their geometry, and they supposed a section made of it by a plane perpendicular to one of its sides; and as the vertical angle of a right cone may be either right, acute, or obtuse, this method of cutting these several cones produced all the three conic sections. The parabola was called the section of a right-angled cone, the ellipse the section of the acute-angled cone, and the hyperbola the section of the obtuse-angled cone. But Apollonius, who on account of his writings on this subject, obtained the title of the Great Geometrician, observed that these sections might be obtained in every cone, both oblique and right, and that they depended on the different inclinations of the section to the cone itself. There have been two methods employed in treating of the conic sections; by the one they are considered as cut out of the solid cone, which is the method of the ancients, and of some of the most elegant writers of the moderns; and by the other method certain curves are defined, either from some property by which any number of points may be found in them, or else by which they may be described mechanically upon a plane; or they are defined by means of an algebraical equation, and in either case these curves are shewn to have the very same properties as those which are formed by the intersections of a plane and cone. Each of these methods has its advantages; although some of the demonstrations of writers who have treated the subject geometrically by the latter, be short and perspicuous, yet there are others upon which depend some of the principal properties, that are tedious and difficult. The demonstrations of writers who have pursued the first method are free from this objection, being generally plain and concise; but they have been obliged to introduce so many previous propositions concerning the properties of lines touching and cutting conical surfaces, in order to arrive at the principal properties of the three sections, that it requires a considerable portion of time and resolution for a beginner in mathematical studies to go through them. Some writers, who have treated the subject algebraically, have reduced the whole into a narrower compass; but in their eagerness to avoid prolixity, they have fallen into another more exceptionable fault. The method in which they have deduced some of the properties, particularly the relations of the abscissæ and ordinates, is extremely operose and inelegant; each step in the process is so little connected with the

preceding one, that it is scarcely possible to retain them in the memory. The conic sections are of great use in physical and geometrical astronomy, as well as in the physico-mathematical sciences, and therefore they have been much cultivated ever since their great importance in these sciences was known.

DEFINITIONS OF THE CONE.

If an indefinite straight line ZX , fig. 1, Plate XLVIII. be made to revolve in the circumference of the circle $BCDE$ so as always to pass through a fixed point A without the circle, the surfaces so generated are called *conical superficies*, or conic surfaces, and when mentioned together, *opposite conical superficies*. Also the solid contained by the conical superficies and a circle is called *a cone*, and the solids contained by the opposite conical superficies, and two circles in parallel planes are called *opposite cones*. The terminating circle is called the *base* of the cone. The fixed point A is the vertex, and the line AF joining the vertex and centre of the base is the *axis* of the cone. When the axis is perpendicular to the plane of the base the cone is called a *right cone*, and when the axis is inclined to the plane of the base it is a *scalene cone*. See **CONE**.

Corollary 1. Hence it is evident, that a straight line drawn from the vertex to any point in the circumference base lies wholly in the conical superficies; for it coincides with the generating line.

Cor. 2. A section passing through the vertex will be a triangle. For let VOB , fig. 4, be a section passing through the vertex V , and meeting the circumference of the base in B and O , then VO , VB , are straight lines by *cor. 1.* and OB is a straight line, since it is the common section of two planes.

Cor. 3. A section parallel to the base is a circle. For let FGH , fig. 5, be a section parallel to the base meeting the axis in X , through the axis draw the plane VAD , and let its common sections with the given plane and with the base be FXH and ACD , also pass any other plane through the axis, as VCB , cutting the given plane and the base in XG and CB ; then because the planes FGH , ABD , are parallel, FH is parallel to AD , and XG to CB , hence by similar triangles $VC : VX :: CB : XG :: CD : XH :: CA : XF$, but CB , CD , CA , are equal; therefore XG , XH , and XF , are equal, hence FGH is a circle.

Cor. 4. If a scalene cone be cut through the axis by a plane perpendicular to the base, as VBC , fig. 6, and in this plane a line LM be drawn, making the angle $VLM = VBC$, and the cone be cut by a plane $MPLQ$, passing through LM , perpendicular to the plane VBC , the section will be a circle. Through any point H in ML draw a plane $GPFQ$ parallel to the base; PQ its common

section with MPLQ is perpendicular to the plane VBC, because the planes GPFQ and MPLQ are perpendicular to it; therefore PQ is bisected in H, and $HG \times FH = PH^2$; also the triangles MHG and FHL are similar, having the angles MGH and FLH equal, and also the vertical angles at H equal, hence $MH : HG :: FH : HL$; therefore $MH \times HL = HG \times FH = PH^2$, hence MPLQ is a circle whose diameter is LM. The circle MPLQ is called a sub-conary section. If a cone be cut by a plane which does not pass through the vertex, and which is neither parallel to the base, nor to the plane of a sub-conary section; the common section of the plane and the surface of the cone will be an ellipse, a parabola, or an hyperbola, according as a plane passing through the vertex parallel to the cutting plane, falls without the cone, touches it, or falls within the cone; as explained in the following definitions:

DEFINITIONS.

1. A *conic section* is the figure formed by the intersection of a cone and a plane. Scholium. The triangle and circle, though conic sections, are not treated under that denomination, but their properties are considered together in plane geometry.

2. A line drawn from the vertex to a point in the circumference of the base of the cone is called a *side of the cone*.

3. A plane passing through the vertex of the cone, and parallel to the plane of the section, is called the *vertical plane*.

4. A plane not cutting the cone, and passing through a side of the cone, is called a *tangent plane*.

5. A straight line drawn in the tangent plane is called a *tangent to the cone*.

6. When the vertical plane as VBN, fig. 7, is wholly without the cone, and not parallel to the base, the section PQ is called an *ellipse*.

Cor. It is evident that because the vertical plane, meets all the sides of the cone, the plane of the section which is parallel to it will meet all the sides of the cone, and cannot meet the opposite superficies. Hence the ellipse surrounds the cone.

7. When the vertical plane is a tangent plane as VBN, fig. 8, the section PQ is called a *parabola*.

Cor. It is evident that the cutting plane can never meet VB, the side of the cone through which the tangent plane passes; hence the curve of the section will not return into itself.

8. When the vertical plane VBN cuts the cone, as in MN, fig. 9, the section is called a *hyperbola*.

Cor. Since the vertical plane meets all the sides of the cone, the cutting plane will likewise meet them, and it is evident that it will meet those which are on one side of the vertical plane in one of the conical superficies, and those on the other side of the vertical plane in the opposite conical superficies, forming a hyperbola in each cone.

9. The two hyperbolas formed in the opposite cones are called *opposite hyperbolas*.

10. A line which meets a conic section but does not cut it, is called a *tangent*; any other line meeting a conic section is called a *secant*.

Cor. It is evident, that a tangent to a conic section is in the tangent plane, and is a tangent to the cone.

11. If the triangular section VAD, fig. 7, 8, 9, be perpendicular to the cutting plane, the common section of these planes, as PQ, terminated by the conical superficies, is called the *transverse axis*, and the extremities of the axis are its *vertices*.

Cor. 1. It is evident, that the transverse axis in the ellipse and opposite hyperbolas has two vertices, and that of the parabola only one vertex.

Cor. 2. It is also evident, that the transverse axis in the ellipse and parabola, is entirely within the section; and the transverse axis of the opposite hyperbolas entirely without the section.

12. The middle of the axis, as C, is the *centre* of the section.

Cor. The parabola has no centre, since PQ is unlimited.

13. If a plane EIFH be drawn parallel to the base of the cone, and cutting the conic section, the common section IH of this plane and the conic section, is called a *double ordinate*, and its half an *ordinate to the transverse axis*.

Cor. 1. The ordinate is at right angles to the axis, for the planes EIFH and PIQH are at right angles to VAD.

Cor. 2. The double ordinate IH is bisected in G, for it is at right angles to the diameter of the circle EIH. Hence IG or GH is an ordinate.

14. The segment of an axis contained between the vertex and ordinate, is called an *absciss*.

15. The double ordinate passing through the centre of the ellipse is called the *conjugate axis*, and its extremities are called the *vertices of the conjugate axis*.

16. If through C, the centre of the opposite hyperbolas, a plane be drawn forming in the cone the circle RS, and if from C a tangent CL be drawn to the circle, the tangent is called the *semi-conjugate axis of the opposite hyperbolas*.

17. The straight line which is a third proportional to the axis, and its conjugate, is called the *parameter of the axis*, or *latus rectum*, in the ellipse or opposite hyperbolas; and a third proportional to an absciss and ordinate in the parabola, is the *parameter of the axis of the parabola*.

Cor. The semi-transverse is to the semi-conjugate, as the semi-conjugate is to half the parameter.

18. The point where that double ordinate which is equal to the parameter cuts the axis, is called the *focus of the section*.

Cor. The ellipse and opposite hyperbolas will have two foci, the parabola only one.

19. If F, fig. 17 and 19, be a focus of an ellipse, or hyperbola, or opposite hyperbolas, and AG betaken in the transverse axis (on the opposite side of the vertex to the focus F), such, that AF is to AG as CF is to CA; then a line, as HK, drawn through G perpendicular to the transverse axis, is called a *directrix of the ellipse, hyperbola, or opposite hyperbolas*.

Fig. 18. But the directrix of a parabola is a line, as HK, perpendicular to the axis, drawn through a point G as far distant from the vertex of the axis on the one side as the focus is on the other side.

Cor. An ellipse, hyperbola, or opposite hyperbolas, have two directrices; one corresponding to each focus. For the same construction that is made for one focus may be made for the other focus.

20. The tangents DLQ, DTq, fig. 23, 24, which are drawn through the extremities of the ordinate passing through the focus, are called *focal tangents*.

21. Any line passing through the centre of an ellipse or hyperbola, and terminated both ways by the curve in the former, but by the opposite curves in the latter, is called a *diameter*.

22. A line drawn through any point in the parabola parallel to the axis, is called a *diameter of the parabola*.

23. Any point where the diameter meets the curve is called a *vertex to that diameter*.

24. If from the centre C, fig. 27, at the distance CA, half the transverse axis, a circle be described, cutting the directrix of the hyperbola in the points H, h, and lines drawn from the centre through the points of intersection, these lines are called *asymptotes*.

25. If AM be the transverse axis, and B b, the conjugate axis of two opposite hyperbolas, and two other hyperbolas be described, of which the transverse axis is B b, and conjugate axis AM, these hyperbolas are said to be *conjugate to the former*.

26. When the two axes are equal, the hyperbolas are said to be *equilateral*.

27. The straight line PR, fig. 33, 34, which is drawn from the point of contact perpendicular to the tangent, intercepted between the tangent and the axis of a conic section, is called a *normal*.

28. The segment of the axis NR, which is intercepted between the ordinate and the normal, is called a *subnormal*.

29. If a straight line be drawn through any point in the diameter of a conic section, parallel to a tangent at the vertex, and terminated both ways by the curve, it is called an *ordinate to that diameter*.

30. The segment of any diameter of a conic section; which is intercepted between an ordinate and the vertex, is called an *absciss*.

31. A diameter which is parallel to the tangent at the vertex of any diameter of the ellipse or hyperbola, is called a *conjugate diameter*.

32. A line which is a third proportional to any diameter of the ellipse or hyperbola, and its conjugate, is called a *parameter of that diameter*.

33. If a line be drawn through the focus of a parabola parallel to the ordinates of any diameter, terminated both ways by the curve, it is called a *parameter to that diameter*.

34. A circle is said to *touch a conic section* in any point, when the circle and conic section have a common tangent in that point.

35. If a circle touch a conic section in any point, so that no other circle can be drawn between the conic section and that circle, it is said to have the same curvature with the section in the point of contact, and is called the *circle of curvature*.

PROPOSITION I. Fig. 10.

A line parallel to a side of the cone will meet the conic surface in one point, and in one only.

Let IH, fig. 10, be parallel to AV, a side of the cone: then because AV meets VD, and IH is parallel to it, IH shall also meet VD; let it meet it in E, then the part EI is wholly within the cone, since it is parallel to AV; in like manner EH is wholly without the cone, therefore HI cannot meet the conical superficies, except in E.

PROP. II. Fig. 11.

Not more than one tangent plane can be drawn through the same side of the cone.

For if possible let each of the planes VBN, VBM, fig. 11, passing through the side of the cone VB, touch the conical superficies, and let BN, BM, be their common sections with the plane of the base; then because the two planes touch the cone, the common sections BN, BM, are tangents to the base of the cone, and at right angles to the radius CB, which is impossible.

PROP. III. Fig. 10.

A right line drawn through a point of a conic surface, so as neither to be a tangent, nor to be parallel to a right line contained in the conic surface, will meet either the same, or the opposite, conic surface again in another point.

Let a plane be drawn through the vertex of the cone and the right line FE or EG, fig. 10; then that plane will cut the cone; for if it do not, the right line FE or EG would be a tangent contrary to the hypothesis. Let VD and VA be the common sections of the plane and the conic surface; then since the right line FE or EG is not parallel to VD or VH contained in the conic surface, therefore it will meet VD and VH either in the same conic surface as FE, or, when produced in the opposite conic surface, as EG.

PROP. IV. Fig. 12, 13, 14.

If a straight line be drawn from the vertex of a cone to a point, as B, in the plane of the base, but not in the periphery of the base; and, through any point, as P, situated without or within the cone, another straight line, parallel to the former, be drawn to cut or touch the conic surface or opposite surfaces; then the square of the line drawn from the vertex of the cone to the point B is to the rectangle under the segments of the secant, or to the square of the tangent drawn from the point P, as the rectangle under the segments of any line drawn from B to cut the base of the cone, is to the rectangle under the segments of any line, parallel to the base of the cone, drawn through the point P, to cut the conic surface.

Let the point B, fig. 12, be without the base of the cone, and let PQ, cutting the conical superficies in R and Q, be parallel to VB, and let the plane VBPQ cut the conic surface in the lines VRG and VQH, and the plane of the base in the line BGH; and through P draw LK parallel to GH. Because QP is parallel to VB, and LK to GH, therefore the triangle QPL is equi-angular to the triangle VBH, and the triangle PKR to the triangle VGB: therefore 4. 6. E.

$$\begin{aligned} VB : PR :: BG : PK \\ VB : PQ :: BH : PL \end{aligned}$$

Consequently, $VB^2 : PR \times PQ :: BG \times BH : PK \times PL$, 23. 6. E. But the rectangle $BG \times BH$ is equal to the rectangle under the segments of any other line drawn from B to cut the base of the cone, 35 and 36. 3. E; and for the same reason the rectangle $PK \times PL$ is equal to the rectangle under the segments of any other line, parallel to the plane of the base, drawn from P to cut the conic surface, because the section formed by a plane passing through PL parallel to the base is a circle, and hence the proportion is manifest in this case.

And if the point B, fig. 13, be within the base of the cone, and a straight line, as PQR, parallel to the line VB that joins the point B

and the vertex of the cone, be drawn to cut the opposite surfaces through a point P, situated without or within the cone: the proposition may be demonstrated in this, as in the former case.

And if the point P, fig. 14, be without the cone, and the line VB, and PS, parallel to VB, be drawn to touch the conic surface, instead of cutting it; then the plane PVB will meet the conic surface in a line VSM; and BM will touch the base of the cone, and PN, parallel to BM, will touch the conic surface. And because the two triangles SPN and VBM are equiangular, therefore

$$\begin{aligned} VB : PS :: BM : PN \\ \text{And } VB^2 : PS^2 :: BM^2 : PN^2 \end{aligned}$$

But BM^2 is equal to the rectangle under the segments of any line drawn from B to cut the base of the cone; and PN^2 is equal to the rectangle under the segments of any line, parallel to the base of the cone, drawn from P to cut the conic surface; and hence the proposition is manifest in this case also.

PROP. V. Fig. 15.

If a point be assumed without or within a cone, and two lines be drawn through it to meet a conic surface, or opposite surfaces, and so as to be parallel to two straight lines given by position; then the rectangle under the segments of the secant, or the square of the tangent, parallel to one of the lines given by position, has to the rectangle under the segments of the secant, or to the square of the tangent, parallel to the other line given by position, a ratio that is constantly the same, wherever the point (from which the lines are drawn) is assumed without or within the cone.

Let VB and VC be two straight lines, fig. 15, drawn from the vertex of a cone to the plane of the base, and given by position (or parallel to lines given by position); and let PQ and MN be two straight lines drawn through any assumed point, as R, to cut the conic surface, and so as to be respectively parallel to CV and VB: then as CV^2 is to the rectangle $CK \times CL$ (contained by the segments of any line drawn from C to cut the base of the cone), so let D, any assumed line, or magnitude, be to E; and as VB^2 is to $BG \times BH$ (the rectangle contained by the segments of any line drawn from B to cut the base of the cone), so let F be to E; and draw ST parallel to the base of the cone through the point R; then, Pr. 4. ($CV^2 : CK \times CL$, or) $D : E :: PR \times RQ : SR \times RT$, and $BV^2 : BG \times BH$, or) $F : E :: MR \times RN : SR \times RT$. Therefore invertendo and ex æquo,

$$D : F :: PR \times RQ : MR \times RN.$$

And, as the same reasoning applies wherever the point R is assumed, therefore the ratio of the rectangles $PR \times RQ$, and $MR \times RN$ is the same with, or equal to, the constant ratio of D to F, wherever the point R is assumed. And, in like manner, may the proposition be demonstrated in all other cases, or in all positions of the lines PQ, and MN whether they cut, or touch, the same or opposite surfaces.

PROP. VI. Fig. 16.

If a right line, as PT, drawn through a point P in the surface of a cone, so as to be parallel to a right line VB contained in the conic surface, meet two parallel lines (in the points R and S) that cut or touch the conic surface or opposite surfaces: then PR is to PS as the rectangle under the segments of the secant, or the square of the tangent, drawn through the point R, is to the rectangle under the segments of the secant, or to the square of the tangent, drawn through the point S. Through the two parallels PT and VB, fig. 16, draw a plane cutting the conic surface again in the line VA, and the plane of the base in the line BA; and, through R and S, draw MN and HG parallel to AB. Because PT is parallel to VB, and RN to SG, therefore RNGS is a parallelogram; and $RN = GS$. It is obvious that the triangles PMR and PHS are equiangular: therefore PR is to PS as MR is to HS, 4. 6. E, or as $MR \times RN$ is to $HS \times SG$, 1. 6. E. But $MR \times RN$ and $HS \times SG$ are respectively equal to the rectangles contained by the segments of any two lines, parallel to the base of the cone, drawn through R and S to cut the conic surface, and hence the proposition is manifest, when PT meets two lines parallel to the plane of the base. And if PT meet two parallel lines DE and IK, not parallel to the plane of the base; then, let the same construction be made as before: and because DE is parallel to IK, and MN to GH; therefore,

$$DR \times RE : MR \times RN :: IS \times SK : HS \times SG;$$

Alternando,

Alternando, $DR \times RE : IS \times SK :: MR \times RN : HS \times SG$.
Therefore, as is obvious from what has already been shewn,
 $PR : PS :: DR \times RE : IS \times SK$.

And if S be without the cone, and the line drawn through it touch the conic surface instead of cutting it, the reasoning is still the same when the square of the tangent is taken in place of the rectangle under the segments of the secant.

PROP. VII. Fig. 7, 9.

In the ellipse and hyperbola the rectangle of the abscisses of the transverse axis, is to the square of their ordinates in a constant ratio which is the ratio of the square of the semitransverse axis, to the square of the semiconjugate.

Let PQ be the transverse axis, as in def. 11, and let IG , KO , be ordinates, and LC the semiconjugate; also let the plane VAD intersect the vertical plane in the line VB , then 16. 11. E . PQ is parallel to VB , and since IGH is parallel to the base of the cone, $VB^2 : AB \times BD :: PG \times GQ : IG \times GH = IG^2$. In the same manner it may be shewn that $VB^2 : AB \times BD :: PO \times OQ : KO^2 :: PC \times CQ = PC^2 : CL^2$; therefore $PC^2 : CL^2 :: PG \times GQ : IG^2$; hence the proposition is manifest.

Cor. 1. The square of the transverse axis is to the square of the conjugate as the rectangle of the abscisses to the square of their ordinate.

Cor. 2. Hence at equal distances from the centre, or from the vertices, the ordinates are equal; for the property is the same on both sides.

Cor. 3. Hence also the two foci are equally distant from the centre, or from either vertex.

Cor. 4. Because $PG \times GQ = PC^2 - GC^2$ in the ellipse, and equal $GC^2 - PC^2$ in the hyperbola, 5, and 6. 2. E . the same property is thus expressed $PC^2 : CL^2 :: PC^2 \propto GC^2 : IG^2$.

Cor. 5. The transverse is to its parameter as the rectangle of the abscisses to the square of their ordinate. For Cor. 1, $PQ^2 : 2 CL^2$

or by division $PQ : \frac{2 CL^2}{PQ} :: PG \times GQ$; or $PC^2 \propto GC^2 : IG^2$;

but $\frac{2 CL^2}{PQ^2}$ is equal to the parameter, def. 17; hence the Cor. is manifest.

Cor. 6. The distance of each foci of an ellipse from either extremity of the conjugate axis is equal to half the transverse axis; and the distance of either of the foci of a hyperbola from the centre is equal to the distance between the extremities of the transverse and conjugate axes.

For let G be the focus, then $PC : CL :: CL : IG$. def. 17. Cor. therefore $PC^2 : CL^2 :: CL^2 : IG^2$

but $PC^2 : CL^2 :: PC^2 \propto GC^2 : IG^2$,

Cor. 4. hence $CL^2 = PC^2 \propto GC^2$ that is $PC^2 - GC^2$ in the ellipse $GC^2 - PC^2$ in the hyperbola; but because GCL is a right angle, $CL^2 = GL^2 - GC^2$; hence in the ellipse $PC^2 = GL^2$, and $PC = GL$. And in the hyperbola $GL^2 = 2 GC^2 - PC^2 = GQ^2 + QL^2 + 2 QC \times GQ$, (12. 2. E .) $= GC^2 + PG \times GQ$. (6. 2. E .) $= GC^2 + 2 QC \times GQ + GQ^2$, therefore $QL^2 = GC^2$, and $QL = GC$; hence the corollary is manifest.

Cor. 7. The semiconjugate is a mean proportional between half the parameter and the two segments between the focus and each vertex of the ellipse, or opposite hyperbolas. For Cor. 6, $CL^2 = PC^2 \propto GC^2 = PG \times GQ$.

PROP. VIII. Fig. 8.

In a parabola the abscisses are proportional to the square of their ordinates.

Let the figure be as in the 7th definition, then because EF , AB , are parallel, $PG : PQ :: GE : QA$, and because GF , QB , are equal, GQ being parallel to FB ; $PG : PQ :: GE \times GF : QA \times QB$, but $GE \times GF = IG \times GH = IG^2$, and $QA \times QB = KQ^2$; therefore $PG : PQ :: IG^2 : KQ^2$.

Cor. 1. Hence the third proportion to the absciss, and ordinate, IG^2 or the parameter of the axis is a constant quantity. For $\frac{IG^2}{PG}$

$= \frac{KQ^2}{PQ}$ = the parameter of the axis, def. 17.

Cor. 2. The distance of the focus from the vertex is equal to half the ordinate passing through the focus. For let HI be the double ordinate passing through the focus, then IG is equal to half the parameter, def. 18; then $PG : GI :: GI : 2GI$, therefore $PG = \frac{1}{2} GI = \frac{1}{2} HI = \frac{1}{4}$ of the parameter.

Cor. 3. The rectangle of the parameter, or four times the distance of the focus from the vertex, and the absciss is equal to the square of the ordinate. Thus if G be the focus $4 PG \times PQ = KQ^2$.

PROP. IX. Fig. 17, 19.

Let AB be the transverse, and DE the conjugate axis of an ellipse, or hyperbola, or opposite hyperbolas; from any point in the curve, or opposite curves, as M , let MC be drawn to the centre, and MP perpendicular to the transverse axis, and take CO in the same axis, such that CO^2 may be equal to $MC^2 - CD^2$ in the ellipse, and to $MC^2 + CD^2$ in the hyperbola; then as AC is to CF , so is PC to CO .

For, because AB and DE are conjugate axes, therefore,

$AC^2 : CD^2 :: AP \times PB : MP^2$ (Prop. 7.) therefore, $AC^2 : AC^2 \pm CD^2 :: AP \times PB : AP \times PB \pm MP^2$. But in the ellipse $AC^2 - CD^2 = CF^2$; (Prop. 7. Cor. 6.) and $AP \times PB - MP^2 = AC^2 - CP^2 - MP^2 = AC^2 - MC^2 = AC^2 - CD^2 - CO^2$ (hyp.) $= CF^2 - CO^2$; and, in the hyperbola, $AC^2 + CD^2 = CF^2$; (Prop. 7. Cor. 6.) and $AP \times PB + MP^2 = PC^2 - AC^2 + MP^2 = MC^2 - AC^2 = CO^2 - CD^2 - CA^2 = CO^2 - CF^2$. Therefore, the last analogy becomes, $AC^2 : CF^2 :: AC^2 \pm CP^2 : CF^2 \pm CO^2$. Consequently, $AC^2 : CF^2 :: CP^2 : CO^2$, (19. 5. E .) And, $AC : CF :: CP : CO$.

PROP. X. Fig. 17, 19.

If M be a point in an ellipse or hyperbola, and MF and Mf be drawn to the foci; then, in the ellipse, the sum of MF and Mf is equal to the transverse axis; and, in the hyperbola, the difference of MF and Mf is equal to the transverse axis.

Draw MP perpendicular to the transverse axis, and take CO as in the last proposition. And, because

$AC : CF :: CP : CO$, Pr. 9,

Therefore, $AC \times CO = FC \times CP$; and $4 AC \times CO = 4 CF \times CP$. But, because AB and DE are bisected in C , therefore $4 AC \times CO = BO^2 - AO^2$, (8. 2. E .) and $4 FC \times CP = PF^2 - MF^2 = fM^2 - MF^2$, 47. 1. E ; therefore $BO^2 - AO^2 = fM^2 - MF^2$.

Again, $MF^2 + Mf^2 = fP^2 + FP^2 + 2MP^2 = 2FC^2 + 2CP^2 + 2MP^2 = 2FC^2 + 2MC^2 = 2FC^2 \pm 2CD^2 + 2CO^2 = 2AC^2 + 2CO^2 = BO^2 + AO^2$.

And, because $BO^2 + AO^2 = fM^2 + MF^2$, and $BO^2 - AO^2 = fM^2 - MF^2$; therefore, by adding the equals, $2 BO^2 = 2fM^2$; and, by subtracting the equals, $2 MF^2 = 2 AO^2$. Therefore $fM = BO$, and $FM = AO$; whence the proposition is manifest.

PROP. XI. Fig. 17, 18, 19.

A straight line drawn from any point in a conic section to a focus has to a perpendicular drawn to the corresponding directrix, a ratio that is constantly the same wherever the point is assumed in the curve; and, in the ellipse, the constant ratio is a ratio of minority (or of a less magnitude to a greater); in the hyperbola the constant ratio is a ratio of majority (or of a greater magnitude to a less); and, in the parabola the constant ratio is a ratio of equality.

Let M , fig. 17 and 19, be a point in an ellipse or hyperbola, and draw MF to a focus, and MK perpendicular to the directrix HG , which corresponds to that focus, draw MP perpendicular to the transverse axis, and take CO , as in Prop. 9. Then

$AC : CF :: CP : CO$, Pr. 9.

Invertendo,

$CF : CA :: CO : CP$

Therefore,

$CF : CA :: FO : AP$, (19. 5. E .)

But,

$CF : CA :: AF : AG$, Def. 19.

Therefore,

$CF : CA :: AO : GP$, (12. 5. E .)

But, as has been shewn in the demonstration of the last proposition, $AO = MF$, and $GP = MK$; therefore

$CF : CA :: MF : MK$.

But the ratio of CF to CA is a constant ratio; and it is a ratio of minority in the ellipse, and a ratio of majority in the hyperbola.

In the parabola, fig. 18, $GA = AF$, and $4 AF \times AP = MP^2$, Prop.

(Prop. 8, Cor. 3.) but $4 AF \times AP = GP^2 - PF^2$, 8. 2. E; therefore $MP^2 = GP^2 - PF^2$; and $MP^2 + PF^2$, or $MF^2 = GP^2$, or MK^2 . Therefore $MF = MK$.

Cor. CA and CG, fig. 17 and 19, are in the same ratio, For CF : CA :: FA : AG; therefore CF : CA :: CA : CG.; Hence CF, CA, and CG, are continual proportionals.

PROP. XII. Fig. 22, 23, 24.

If two straight lines DQ, Dg be drawn from the point D, where the axis meets the directrix, through L and T, the ordinate passing through the focus, which are produced both ways in the hyperbola; and through any point P in the curve of the section a line QPp be drawn parallel to the directrix, meeting DL and DT in Q and q; the segment QN, which is intercepted between either of the lines and the axis, will be equal to SP, the distance of P from the focus.

The triangles DNQ, DSL, are similar, therefore NQ : ND :: SL : SD, i. e. :: SP : ND. Prop. 11. Hence NQ = SP, and in the same manner it may be proved that Ng = Sp.

Cor. 1. If KAG be drawn through the vertex parallel to the directrix, SA will be equal to AK or AG.

Cor. 2. The lines DQ, Dg, touch the conic section in the points L and T. For the triangle SNP being right-angled, SP or QN is always greater than PN except when P is at L, where they coincide; therefore DQ meets the curve only in one point L. In like manner it may be shewn that Dg touches the curve at T.

PROP. XIII. Fig. 22, 23, 24.

If from the point G, where the straight line KG, which is drawn through the vertex parallel to the directrix, meets either of the tangents DQ, Dg, a line GR be drawn through the focus S, and produced both ways in the hyperbola, it will be parallel to the other tangent DQ in the parabola; it will meet it somewhere in g in the direction GSG in the ellipse, and in the opposite direction in the hyperbola.

Let SG meet the directrix in X. The triangles SAG, SDX, are similar; now SA = AG, Cor. 1. Prop. 12, therefore SD = DX, but in the parabola, fig. 22, SL = DS, therefore SL is equal and parallel to DX; and consequently XS is equal and parallel to DL. In the ellipse, fig. 23, SL is less than SD or DX, and therefore the lines DL, XS, must meet when produced in the direction XGS. In the hyperbola, fig. 24, SL is greater than SD or DX; and therefore the lines must meet when produced in the direction SGX.

Cor. 1. Because the triangles GAS, SNR, are similar, SN will be equal to NR.

Cor. 2. Fig. 23, 24. Hence where Q coincides with g; in the ellipse or opposite hyperbola, QN will be equal to gM, or SM; therefore SP will be equal to SN; and therefore SP will coincide with SN, and the curve will meet the axis in the point M.

Cor. 3. Hence the whole ellipse, fig. 23, is contained between the lines GK, gk, on one side of the directrix.

Cor. 4. In the parabola, fig. 22, NQ being always greater than NR, except at the vertex, SP is greater than SN; therefore the curve will meet the axis only in one point A, and it will extend without limit on one side of the directrix.

Cor. 5. In the hyperbola, fig. 24, NQ being greater than NR, except at A and M, SP is greater than SN, and the two curves will be extended without limit, on opposite sides of the directrix.

PROP. XIV. Fig. 25, 26.

The conjugate axis bisects all lines drawn parallel to the transverse axis, which are terminated by the ellipse, and by the opposite hyperbolas. Those lines which are equally distant from the centre are equal; and those which are nearer to the centre are greater in the ellipse, and less in the hyperbola, than those which are more remote.

Take CN any distance from the centre, between C and A in the ellipse, and in CA produced in the hyperbola. Take CR = CN, and draw the ordinates PNp, QRq; join PQ, pQ, meeting Bb in n and r. Because Pp and Qq are equal, Cor. 3, Prop. 7, and they are bisected in N and R, the lines PQ, NR, pQ, qR are equal and parallel, and because Pn, pr, are equal to NC, and Qn, qr, equal to RC, or NC, PQ, pQ, are bisected in n and r, and they are at equal distances from the centre, because Cn, Cr,

are equal to PN, Np. Lastly, as Cn decreases, PN decreases, and therefore CN increases in the ellipse, and decreases in the hyperbola; but Pn is equal to CN, Pn therefore increases in the former, and decreases in the latter, as Cn, its distance from C, decreases.

Cor. 1. The conjugate axis divides the ellipse into two equal and similar parts, and the two opposite hyperbolas are equal and similar.

Cor. 2. Suppose PQ, fig. 26, which is always parallel to AM, to move from the centre towards B, the points P, Q, will coincide at B, and the line EPQ will become a tangent to the ellipse; therefore the ordinates to the conjugate axis are parallel to the tangent at its vertex. A line parallel to Pp, and passing through A, is a tangent.

PROP. XV. Fig. 26.

The square of the semi-ordinate to the conjugate axis, in the ellipse, is to the rectangle under the abscissa as the square of the transverse axis to the square of the conjugate axis.

For PnQ being parallel to AM, it is perpendicular to Bb, and it is bisected in n, by the last Prop. it is therefore an ordinate to Bb, and by Prop. 7, PN^2 , or $Cn^2 : BC^2 :: AN \times NM : AC^2$, and by division $Bn \times nb : BC^2 :: CN^2$ or $Pn^2 : AC^2$, and by alternation and inversion $Pn^2 : Bn \times nb :: AC^2 : BC^2 :: AM^2 : Bb^2$.

PROP. XVI. Fig. 20, 21.

All the diameters of an ellipse or hyperbola are bisected in the centre.

From any point P in the curve draw PC to the centre, and PN perpendicular to the axis. Take Cn = CN; and draw nG parallel to NP, but on the other side of the axis, let it meet the curve in G, and join CG. Then because Cn = CN, the semi-ordinates Gn, PN, will be equal, Cor. 2, Prop. 7, and the angles at N and n are right angles, therefore the triangles CNP, CnG, are equal, therefore CG = CP, and the angle nCG is equal to NCP; hence it follows that GCP is a straight line, which is bisected at C.

PROP. XVII. Fig. 27.

If lines SH, Sh, be drawn from the focus S to the points H, h, in which the asymptotes cut the directrix, they will be perpendicular to the asymptotes; and these lines, as also AG, Aa, the segments of the tangent at the vertex, which is intercepted between the asymptotes, are each equal to half the conjugate axis.

For Cor. Prop. 11, CS : CA :: CA : CD, that is, CS : CH :: CH : CD; now the angle HCS is common to the two triangles CHD, CSH, therefore these triangles are similar, and the angle CHS = CDH = a right angle. In the same way it may be proved that CAs is a right angle.

Again, $SH^2 = SC^2 - CH^2 = SC^2 - CA^2 = CB^2$ by Prop. 7, Cor. 6; therefore SH = CB. In the same way it may be proved that Sh = CB: and because CH = CA, and CHS, CAa, are right angles, and the angle HCS is common to the triangles SHC, aAC, these triangles are equal, and Aa = SH = BC.

Cor. 1. Radius is to the sine of the angle contained by the asymptote and directrix in the constant ratio, mentioned Prop. 11, for CA or CH is to CD in the same ratio, and CH : CD :: radius : sine CHD.

Cor. 2. If a line PG, fig. 28, be drawn from any point P in the hyperbola, or in the opposite curve, parallel to the asymptote, meeting the directrix in G, PG will be equal to PS. Draw PE perpendicular to the directrix; and because the angle PGE = CHD, PG is to PE in the above-mentioned ratio, or as SP to PE, therefore PG = PS.

PROP. XVIII. Fig. 28.

The asymptotes never meet the curve, but any other line drawn parallel to an asymptote will meet one of the hyperbolas.

For, if it be possible, let the asymptote meet the curve in the point R. Join RS, and draw RN perpendicular to the directrix. Then by Cor. 1, last Prop. HR is to RN, as SR to RN, therefore RS = RH, and the angle RSH = RHS, which is impossible; for by last Prop. RHS is a right angle. In the same way it may be proved that it cannot meet the opposite curve. Let any other line GP be drawn parallel to the asymptote; and first let it be nearer to the focus. Join SG, and produce it to meet the asymptote CH in I: then the angle SGP = SIH, which is less

than SHR , a right angle; therefore, if GSP be made equal to SGP , SP , GP , will meet somewhere in P , which is a point in the curve. For draw PE perpendicular to the directrix, and the angle PGE being equal to CHD , PG is to PE in the constant ratio mentioned Prop. 11; therefore SP is to PE in the same ratio, and P is a point in the hyperbola.

Secondly, let gp be drawn parallel to the asymptote, at a greater distance from the focus. Join Sg , meeting HC in i ; the angle $Sgp = SiH$ which is less than a right angle; if therefore gSp be made equal to Sgp , the lines Sp , gp , will meet when produced in some point p , which is in the opposite hyperbola; for the angle pge being equal to CHD , pg is to pe , or SP is to pe in the same constant ratio; therefore p is a point in the curve.

Cor. Hence, if any line be drawn through the centre of an hyperbola within the angle contained by the asymptotes, it will meet both the curves.

PROP. XIX. Fig. 27.

The asymptotes are diagonals, of the rectangle, which is made by drawing tangents through the vertices of the four hyperbolas.

Let the tangents GAa , IMi , which are drawn through the vertices of the transverse axis, meet the asymptotes in G , a , and I , i . Join IB , GB , as also ab , ib . The triangles MCI , ACa , are equal, for $AC = CM$, the angle $MCI = ACa$, and $CMI = CAa$, therefore $MI = Aa$, which is equal to CB , Prop. 17. In like manner it may be proved that $Mi = Cb = CB$; therefore, IB , GB , are equal and parallel to MC , Ca , the angles IBC , GBC , are each a right angle, and IBG is one straight line, which is equal and parallel to MA . For the same reason iba is one straight line, which is equal and parallel to MA ; and because the lines IBG , iba , are perpendicular to the axis BCb , they are tangents to the conjugate hyperbolas, and $IGai$ is a rectangle of which the asymptotes Ia , Gi , are the diagonals.

Cor. 1. The asymptotes GCi , ICA , are also asymptotes to the conjugate hyperbolas. For $BI = BG = CA$, which is the semi-conjugate axis to the hyperbolas LBR , lbr .

Cor. 2. If the hyperbolas be equilateral, the asymptotes will be perpendicular to each other. See DEF. 25, 26.

PROP. XX. Fig. 29, 30, 31.

If a straight line Pp , which cuts a conic section or opposite sections in two points P , p , meets the directrix in H , and a right line HST be drawn through the focus, and SP , Sp , be joined; the angle PSH will be equal to pST .

Draw pT parallel to PS , and let it meet HS in T ; and draw PE , pe , perpendicular to the directrix. The triangles HPE , Hpe , are similar, as also HSP , HTp , and $SP : PE :: Sp : pe$; and alternately $SP : Sp :: PE : pe :: HP : Hp :: SP : pT$; therefore $SP = Tp$, and the angle $pST = pTS = PSH$.

Cor. 1. When P and p coincide, fig. 29, 31, or when HP becomes a tangent to the conic section, SP will coincide with Sp , and the angles PSH , pST , will be right angles.

Cor. 2. Hence if a line SP be drawn from the focus to any point P in a conic section, fig. 32, and SH be drawn perpendicular to SP , meeting the directrix in H , and HP be joined, it will touch the conic section in P .

Cor. 3. It is evident from this proposition, that a straight line cannot cut a conic section in more points than two.

PROP. XXI. Fig. 32.

If a tangent be drawn to any point in the parabola, it will bisect the angle contained by the two straight lines drawn from the point of contact, one to the focus, and the other to the directrix.

Let PH , which touches the parabola at P , meet the directrix in H . Join SP , SH , and draw PE perpendicular to the directrix. The angle SPE is bisected by PH . For $SP = PE$, and PH is common to the triangles SPH , EPH , and PSH , PEH , are right angles, therefore the triangles SPH , EPH , are similar; and the angle $SPH = EPH$.

Cor. 1. Hence if a straight line PH bisects the angle SPE , it will be a tangent to the parabola at the point P .

Cor. 2. Let PS meet the curve again in p , and let HI be drawn parallel to the axis, it will bisect Pp in I , and HI will be bisected by the curve in A . For the angle $IHP = HPE = HPI$, therefore $IP = IH$, and if pH be joined, the line pH will be a

tangent, and therefore for the same reason $Ip = IH$, therefore $IP = Ip$. Secondly, because $SA = AH$, the angles $ASH = AHS$, and the complements of these angles are equal, that is, $ASI = AIS$, therefore $AI = AS = AH$.

PROP. XXII. Fig. 33, 34.

If a tangent be drawn to any point in an ellipse or an hyperbola, and two lines be drawn from the point of contact to the foci, the angles contained by each of these lines and the tangent are equal. Let PT touch the ellipse or hyperbola at any point P , let it meet the directrices in T and t . Through P draw a line parallel to the axis AM meeting the directrices in E and e , draw PS , PH , to the foci, and join ST , Ht . Because the triangles TPE , tPe , are similar, $PE : PT :: Pe : Pt$, and $SP : PE :: HP : Pe$, therefore $SP : PT :: HP : Pt$, and the angles PST , PHt , are right angles, Cor. 1, Prop. 20, therefore the triangles SPT , HPt are similar, and the angle $SPT = HPt$.

PROP. XXIII. Fig. 35, 36.

The tangents at the vertices of any diameter of an ellipse or an hyperbola are parallel.

Let PCG be any diameter of an ellipse or hyperbola; draw the tangents PQ , GR , and join SP , PH , SG , GH . Because $SC = CH$, and $CP = CG$, and the angle $SCP = GCH$, also SP is equal and parallel to GH , therefore PH is equal and parallel to SG , and $SPHG$ is a parallelogram; therefore the angle $SPH = SGH$, and the halves of these angles, fig. 36, or the halves of their supplements, fig. 35, will be equal, that is, the angle $SPQ = HGR$, and if these be added to the equal angles SPC , CGH , in the ellipse, and subtracted from them in the hyperbola, $CPQ = CGR$, therefore PQ is parallel to GR .

PROP. XXIV. Fig. 37, 38, 39.

If two straight lines Pp , Qq , which meet each other in any point L , and are inclined to the directrix at any given angles LHX , LhX , cut a conic section, or opposite sections, in the points P , p , and Q , q ; the rectangles $LP \times Lp$, and $LQ \times Lq$, will be in a constant ratio to each other.

Let S be the nearest focus. Join HS , and produce it if necessary; also join SP , Sp . Draw LX , PE , perpendicular to the directrix; and draw LT , Lt , parallel to SP , Sp , meeting HS in T and t . Because (Prop. 20,) the angle $PSH = pST$, fig. 37, and 39, and $= pSW$, fig. 38, the angle $LIt = LtT$, and $LT = Lt$. On L as a centre, at the distance LT or Lt , describe a circle cutting Hpp in M and m . Join SL , and produce it to meet the circle in D and d ; and because the triangles HPE , HLX , are similar, as also HPS , HLT , $LT : SP :: LH : PH :: LX : PE$; and alternately $LT : LX :: SP : PE$, that is, in the constant ratio mentioned Prop. 11; therefore the radius of the circle is given when the distance of L from the directrix is given, whatever be the position of the line Pp . And because LT is parallel to PS , and Lt to pS ,

$$LP : TS :: LH : HT,$$

$$\text{and } pL : St :: LH : tH, \text{ therefore}$$

$$PL \times Lp : TS \times St :: LH^2 : HT \times tH.$$

But $TS \times St = DS \times Sd$, and $TH \times Ht = MH \times Hm - LH^2 - LM^2$, fig. 37, 38, or $= LM^2 - LH^2$, fig. 39. Therefore $PL \times Lp : DS \times Sd :: LH^2 : LH^2 - LM^2$, or $LM^2 - LH^2$. But $LH^2 : LT^2$, or $LM^2 :: PH^2 : PS^2$, and by division $LH^2 : LH^2 - LM^2$, or $LM^2 - LH^2 :: PH^2 : PH^2 - PS^2$, or $PS^2 - PH^2$; which ratio depends only upon the constant ratio, Prop. 11, and the angle LHX , SP being to PH in a ratio which is compounded of the ratios of SP to PE , and PE to PH , or of the constant ratio, and of the sine of the angle LHX to radius. In the same manner it may be proved that the rectangle $QL \times Lq$ is to $DS \times Sd$ in a ratio depending only on the same constant ratio, and the angle LhX , therefore $PL \times Lp$ is to $QL \times Lq$ in a constant ratio, whatever be the distance of L from the directrix.

Cor. 1. If either of the lines Pp , Qq , or both of them become tangents to the conic section, or opposite sections, the squares of the tangents must be substituted for the rectangles $PL \times Lp$, $QL \times Lq$. For let LP touch the section in P , fig. 40, 41, then QL being parallel to SP , by the preceding Prop. $LP : QS :: LH : HQ$; and $LP^2 : QS^2 :: LH^2 : HQ^2$; but $QS^2 = DS \times Sd$, and $QH^2 = MH \times Hm = LH^2 - LM^2$, therefore $LP^2 : DS \times Sd :: MH^2 : LH^2 - LM^2$, which was proved to be a constant

stant ratio; therefore LP^2 , is to Lp^2 or $QL \times Lq$, fig. 38, in a constant ratio.

PROP. XXV. Fig. 42.

If two right lines QL , Pp , meeting each other at any point L , one of which is parallel to the axis, and the other is inclined to the directrix in a given angle, cut a parabola in the points Q, p , and P , the rectangle under QL , and the latus rectum, will be to the rectangle $PL \times Lp$ in a constant ratio. Let LQ meet the directrix in X ; and from the centre L , at the distance LX , describe a circle, join QS , XS , S being the focus, let XS meet the circle in T , and join LT . Draw SO perpendicular to LX , take $OI = OX$, and join SI , then $SI = SX$, now $LT = LX$, and $QS = QX$, therefore LT is parallel to QS , and because the angle $QSX = SXQ = SIX$, the triangles QXS, SXI , are similar, and $IX \times XS :: XS : SQ :: ST : QL$, therefore the rectangle $IX \times QL = XS \times ST = DS \times Sd$, which by the preceding proposition is to $PL \times Lp$ in a constant ratio, and because $IX \times 2OX$, the distance of the focus from the directrix, therefore $IX = \text{latus rectum}$, therefore the rectangle under QL , and the latus rectum, is to $PL \times Lp$ in a given ratio.

LEMMA. Fig. 43.

If a straight line be divided in two points C and D , such, that the rectangle $CA \times AD = DB \times BC$, or $AC \times CB = BD \times DA$, the part AC will be equal to BD . First, let $CA \times AD = DB \times BC$. Bisect CD in E ; and $CA \times AD \times EC^2 = AE^2$, also $DB \times BC \times ED^2 = EB^2$, but $ED^2 = EC^2$, therefore $BE^2 = AE^2$, and $BE = AE$, and therefore $BD = AC$. Secondly, let $AC \times CB = BD \times DA$, by bisecting AB in E , it may be shewn as above, that $ED = EC$, and therefore $BD = AC$.

PROP. XXVI. Fig. 44, 45.

All lines parallel to any diameter of the ellipse or hyperbola, which are terminated both ways by the ellipse or opposite hyperbolas, are bisected by the conjugate diameter.

Let ACB be any diameter of an ellipse or hyperbola. Through the vertices A, B , draw the tangents AL, BM ; and through the centre C draw the diameter DCK parallel to AL or BM , which will be the conjugate diameter. Through N any point in DK draw LN parallel to AB , meeting the ellipse or opposite hyperbolas in P and Q , and the tangents AL, BM , in L and M . Then AL being parallel to CN and BM , and LN parallel to ACB , $AL = BM$, and $LN = NM$; and *Cor.* Prop. 24, $LA^2 : PL \times LQ :: BM^2 : QM \times MP$, therefore $PL \times LQ = QM \times MP$, therefore *Lem.* $PL = QM$, and, because $LN = NM$, $PN = NQ$.

Cor. 1. If the diameter DK bisect all lines parallel to AB , it will be the conjugate diameter to AB .

Cor. 2, Fig. 44. If a straight line RDT be drawn through D the vertex of the conjugate diameter parallel to AB , it will touch the curve in the point D .

PROP. XXVII.

Every diameter of a conic section bisects all its ordinates.

1st. If the section be an ellipse, it is evident, from the last proposition, for the ordinates of any diameter are parallel to the conjugate diameter.

2dly. If the section be an hyperbola, Fig. 45, of which ACB is any diameter; in the tangent RAL take $AR = AL$, through L and R draw PLQ, PRG , parallel to AB , meeting the opposite hyperbolas in P, Q , and F, G , and the tangent at B in M, T . Join PF , cutting the diameter in V : then PF will be an ordinate which is bisected at V ; for by last Prop. $PL = MQ$, and $FR = TG$; and *Cor.* Prop. 24, $FR \times RG : RA^2 :: PL \times LQ : LA^2$, but $LA^2 = RA^2$, therefore, $FR \times RG = PL \times LQ$, that is $RF \times FT = LP \times PM$; therefore *Lem.* $RF = PL$, and $PLRF$ is a parallelogram, and therefore PF is parallel to RAL , and $PV = VF$.

Lastly, let the section be a parabola, Fig. 46, of which AN is any diameter, and PNQ an ordinate; through the vertex A draw the tangent LAM ; and draw PL, QM , parallel to NA , then $PL = QM$, but the rectangle under LP and the latus rectum is to LA^2 as the rectangle under MQ and the latus rectum to MA^2 ,

therefore $LA^2 = MA^2$, and $LA = MA$, and therefore $QN = PN$.

PROP. XXVIII. Fig. 47.

If a straight line cutting the hyperbola, or opposite hyperbolas, meets the asymptotes in two points; the segments between the hyperbola or hyperbolas and asymptotes will be equal.

Let PQ cut the hyperbola, or the opposite hyperbolas in P and Q , and meet the asymptotes in R, T : the segments PR, QT , will be equal. For if PR be not equal to QT , let one of them, as QT , be the greater; and $Qo = PR$, join Co , which being produced will meet the curve in some point r , *Cor.* Prop. 18. Through q draw qpr parallel to QP meeting the curve in p and asymptote in r . Bisect PQ in N , and draw the diameter CNa , and PQ, pq , will be ordinates to that diameter. Because $NQ = NP$, and $Qo = PR$, therefore $No = NR$, and $oN : qn :: CN : Cn :: NR : nr$, therefore $nq = nr$; but $nq = np$, therefore $np = nr$, which is absurd; therefore QT is not greater than PR .

Cor. If the line TNR be supposed to move from N to A , the points P, Q , will coincide in A , and IA will be equal to AG ; therefore when a line touches an hyperbola, the segments between the point of contact, and the asymptotes are equal.

PROP. XXIX. Fig. 48.

If from any point P in the hyperbola PQ two straight lines PL, PH , be drawn to the asymptotes, and from any other point Q , in the same or in the opposite curve, there be drawn other two straight lines QE, QF , parallel to the two former lines PL, PH . The rectangle $QE \times QF$ will be equal to the rectangle $PL \times PH$.

Join PQ , and let it meet the asymptotes in R and T : and because the triangles TQF, TPH , are similar, as also the triangles $RPL, PQE, QF : PH :: TQ : TP :: RP : RQ :: PL : QE$; therefore the rectangle $QF \times QE$ is equal to the rectangle $PH \times PL$.

Cor. Hence, if from any two points, P, Q , in the same or in the opposite hyperbolas, two straight lines, PL, QE , be drawn to the same or to different asymptotes parallel to the other asymptote: the rectangles $CL \times LP, CE \times EQ$, will be equal; also the parallelogram $CLPH$ will be equal to the parallelogram $CEQF$; and the triangle CLP to the triangle CEQ .

PROP. XXX. Fig. 58.

If, from any point R in the asymptote of a hyperbola, there be drawn a straight line RT cutting the hyperbola, or opposite hyperbolas in P and Q , and the other asymptote in T ; the rectangle $PR \cdot RQ$ is equal to the square of the semidiameter which is parallel to RT .

Let AM, Bb , be the two axes, join AB meeting the asymptote in N . Draw the tangent IAa meeting the asymptotes in I and a . Because Aa is equal and parallel to BC , Prop. 17, AB is equal and parallel to aC , and $IA : Ia :: aC : AC$, or AB ; now IA is half of Ia , therefore AN is half of AB , and $AN = NB$.

Let CF be the semidiameter parallel to the line cutting the opposite hyperbolas, draw the tangent LH meeting the asymptotes in L and H , draw FE parallel to CL , meeting the asymptotes in E , and the conjugate hyperbola in D , and join CD . Because the rectangle $CN : NA$, or $CN : NB = CE : EF$, *Cor.* Prop. 29, and $CN : NB = CE : ED$: therefore $CE : EF = CE : ED$, and $EF = ED$, and FE is half of FD , but because LF is half of LH , *Cor.* Prop. 28, and FE is parallel to CL ; FE , is also half of CL , therefore $FD = CL$, and they are parallel, therefore CD is equal and parallel to FH , and CD is a conjugate diameter to CF . Let the line which cuts the hyperbola PFQ be parallel to CD or LH . Take any point t in the asymptote, and draw tr parallel to TR , cutting the curve or opposite curves in p and q , and the other asymptote in r . Draw PY, PZ, py, pz , parallel to the asymptotes. Because the triangles PYR, pyr , are equiangular.

$PR : PY :: pr : py$, and in like manner,

$PT : PZ :: pt : pz$, therefore

$RP \times PT : YP \times PZ :: rp \times pt : py \times pz$; but $YP \times PZ = yp \times pz$, *Cor.* Prop. 29; therefore $RP \times PT = rp \times pt$; or since $RP = QT$, Prop. 28, $PR \times RQ = pr \times rq$; and when P is taken at F , the rectangle $PR \times RQ$ becomes FL^2 , or FH^2 , which

which is equal to CD^2 ; and when P in the opposite hyperbola is at M, the rectangle $PR \times RQ$ becomes equal to GC^2 .

PROP. XXXI.

If two right lines meeting each other cut or touch a conic section, or opposite sections, the rectangles under the segments between the point of concourse and the points of intersection, or the squares of the tangents will be to each other as the squares of the semidiameters to which the lines are parallel.

If the lines be parallel to any of the diameters of the ellipse, or of the opposite hyperbolas, the proposition is evident from Prop. 24, because the lines which meet each other make the same angles with the directrix as those which pass through the centre, and the latter are bisected in the centre. But if either of the lines PLQ , LRT , or both the lines PLQ , NLM , be parallel to some of the conjugate diameters of the hyperbola, Fig. 49, produce QLP till it meet the asymptote in G, and through G draw FGH parallel to LRT , meeting the opposite curves in F and H. Let CB , CD , CA , be the semidiameters which are parallel to QP , MN , RT . Then Prop. 24, $PL \times LQ : RL \times LT :: PG \times GQ : FG \times GH :: CB^2 : CA^2$, Prop. 30. In like manner it may be proved, that $RL \times LT : NL \times LM :: CA^2 : CD^2$; therefore, $PL \times LQ : NL \times LM :: CB^2 : CD^2$.

If the lines touch the conic section or opposite sections, the squares of the tangents will be to each other as the rectangles under the segments of any two lines drawn parallel to them, which meet each other, and cut the section or opposite sections; and therefore they are as the squares of the semidiameters to which they are parallel.

Cor. If two right lines IQ , IN , Fig. 49, 50, meeting each other in I, touch an ellipse or hyperbola in Q, N, and are parallel to two other lines VT , VN , which meet each other in V, and touch the ellipse or opposite hyperbola, or hyperbolas, in T, N; $IQ : IN :: VT : VN$: for IQ^2 , IN^2 , are to each other as the squares of the semidiameters to which they are parallel, and VT^2 , VN^2 , are in the same ratio.

PROP. XXXII. Fig. 51, 52.

If an ordinate be drawn to any diameter of an ellipse or an hyperbola; the rectangle under the abscisses will be to the square of the semi-ordinate as the square of the diameter is to the square of its conjugate.

Let ACM be any diameter of an ellipse or hyperbola, to which PNQ is an ordinate, and let DCK be the conjugate diameter, which is parallel to PNQ . Then by the preceding proposition $AN \times NM : PN \times NQ$ (or PN^2) :: $CA^2 : CD^2 :: AM^2 : DK^2$.

Cor. 1. Because the parameter is a third proportional to the diameter and its conjugate, the rectangle under the abscisses is to the square of the semi-ordinate as the diameter is to the parameter.

Cor. 2. The two conjugate diameters being constant, the rectangle under the abscisses will vary as the square of the ordinate.

PROP. XXXIII. Fig. 53.

If an ordinate be drawn to any diameter of a parabola; the square of the semi-ordinate is equal to the rectangle under the abscisses and the parameter.

Let AN be any diameter of the parabola to which PNQ is an ordinate. Draw the parameter TSV , cutting the diameter in F; join SA , let the diameter meet the directrix in D. Because TF is half of TV , Prop. 27, and AF is half of DF , or TF , Prop. 21, Cor. $AF : FT :: FT : TV$, and $AF \times TV = FT^2$; but $AF \times TV : AN \times TV :: FT^2 : PN^2$, Prop. 25, therefore $AN \times TV = PN^2$.

Cor. Because $TV = 2TF = 4SA$, $4SA \times AN = PN^2$.

PROP. XXXIV. Fig. 54.

If two tangents be drawn at the extremities of any right line which is terminated by a conic section, and which does not pass through the centre of an ellipse, they will meet each other in the diameter which bisects that right line.

Let PQ meet the curve in P and Q; bisect PQ in N, and through N draw the diameter CNT . Through P draw the tangent PT meeting the diameter in T, and join TQ , which will

touch the conic section in Q. For draw any other line DCB parallel to PNQ , meeting TP , TQ , in L and M. The triangles TNP , TCL , are similar, as also TNQ , TCM , therefore,

$NP : CL :: TN : TC :: QN : MC$, and alternately $NP : NQ :: CL : CM$; therefore $CM = CL$, which is greater than CD or CB , therefore M is without the section, and the line TQ meets the curve only in one point Q.

Cor. If two right lines which touch a conic section meet each other, a right line drawn through the point of concourse bisecting the line which joins the points of contact, will be a diameter of the section.

PROP. XXXV. Fig. 55.

If a tangent to any point in the parabola meet a diameter, and an ordinate be drawn to that diameter from the point of contact, the segment of the diameter between the vertex and the tangent will be equal to the absciss.

Let TP , which touches the parabola in any point P, meet the diameter NA in T, and draw the ordinate PN . NA will be equal to AT . Draw the tangent AI meeting PT in I; join AP , and draw the diameter IG cutting AP in F, and PN in G; then $AF = FP$, Cor. Prop. 34. Therefore AI or $NG = PG$; and AI is half of NP ; but $AI : NP :: TA : TN$, therefore TA is the half of TN .

PROP. XXXVI. Fig. 56, 57.

If a tangent to any point in an ellipse, or an hyperbola meet a diameter, and from the point of contact an ordinate be drawn to that diameter, the semidiameter will be a mean proportional between the segments of the diameter, which are intercepted between the centre and the ordinate, and between the centre and the tangent.

Let PT touch the ellipse or hyperbola in any point P, and meet the diameter MA in T; draw PNQ an ordinate to the diameter MA , $CN : CA :: CA : CT$. Through the vertices A, M, draw the tangent AI , ML , meeting PT in I and L; take $CO = CN$, then Cor. Prop. 31, $IP : IA :: LP : LM$, and alternately $IP : LP :: IA : LM$, and because AI , NP , LM , are parallel, $AN : NM :: TA : TM$, and by composition, (fig. 57,) or by division, (fig. 56,) $ON : AN :: AM : TA$; and by taking the halves of the antecedents, $CN : AN :: CA : AT$, and by composition, (fig. 57,) or by division, (fig. 56,) $CA : CN :: CT : CA$, and by inversion $CN : CA :: CA : CT$.

PROP. XXXVII. PROBLEM. FIG. 59.

Two unequal straight lines being given, which bisect each other at right angles; to describe an ellipse, of which the given lines shall be the axes.

Let AM , Bb , be the given lines of which AM is the greater. From the centre B, with a radius equal to AC , describe a circle meeting AM in S and H, which will be the foci, Prop. 7, Cor. 6. Take a string equal in length to AM , and fix the extremities of it at the points S and H; and by means of a pin at P let the string be stretched, and let the pin be carried round, till it return to the same point; the point P will describe an ellipse, of which AM , Bb , are the axes, as is evident from Prop. 10.

PROP. XXXVIII. PROB. FIG. 60.

Two straight lines being given, which bisect each other at right angles; to describe an hyperbola, of which these lines shall be the axes.

Let AM , Bb , be the given lines, bisecting each other at right angles in C. Join AB ; and take CS and CH , in AM produced both ways, equal to AB . At the point H let one end of a ruler be fixed, so that it may move round this point as a centre; and let a string be taken, the length of which exceeds that of the ruler by a line equal to AM ; let one end of the string be fixed at L, and the other at the point S; apply the string, by means of a pin at P, to the side of the ruler LH ; and let the ruler be moved about the centre H, while the string is constantly applied, and kept close to the ruler by the pin at P. Then the difference between the whole length of the string SPL and the ruler HL being equal to AM , the difference between HP and PS will be equal to AM ; and the point P will describe one of the opposite hyperbolas of which AM , Bb , are the axes, as is evident from Prop. 10.

†

PROP.

PROP. XXXIX. PROB. FIG. 61.

Two right lines being given, one of which is bisected by the other at right angles; to describe a parabola, in which the right line bisected shall be an ordinate, and the other line the axis.

Let AC, Bb be the two given lines, one of which Bb , which is perpendicular to AC , is bisected in C . Find a third proportional to AC, CB ; and produce CA to D , so that AD may be a fourth part of that third proportional; take $AS = AD$, and draw DX perpendicular to DC . Let a ruler, the sides of which HE, EL , are perpendicular to each other, be placed in the plane CDX , so that the side EL may be applied to DX ; and take a string equal in length to the side HE , one extremity of which must be fixed at H , and the other at S ; and let part of the string be applied by means of a pin P to the side of the ruler HE ; and whilst the side EL moves along DX , let the string be stretched by the pin, and constantly applied to HE . Then, because the whole length of the string HPS is equal to HE , the part SP will always be equal to PE ; therefore the point P will describe a parabola, by Prop. 12, of which AC is the axis, S the focus, and DX the directrix; and BCb will be an ordinate, because it is perpendicular to the axis, and CB is a mean proportional between the absciss AC and $4AS$, or the latus rectum.

PROP. XL. PROB. FIG. 40, 41.

To draw a tangent to a conic section from any given point without it, which is not the centre of the hyperbola.

If the given point H be in the directrix; draw HS to the focus which is nearest to the directrix; draw SP perpendicular to SH , meeting the curve in P , and join HP , which will touch the conic section in P , Cor. 1, Prop. 20.

If the given point be in any other situation, as at L ; join LS , and draw LX perpendicular to the directrix. Take LD to LX in the constant ratio, Prop. 11, and from the centre L , at the distance LD , describe a circle DMq . From S draw SQ a tangent to the circle, meeting the directrix in H . Join LQ , and draw SP parallel to it, or perpendicular to SH . Join HL , and produce it to meet SP in P , which is in the conic section, and the line HP touches the curve at P . For the triangles HQL, HSP , are similar, as also LHX, PHE , therefore $SP:PH::QL:LH$, and $PH:PE::LH:LX$; therefore $SP:PE::QL:LX$, that is, in the constant ratio; therefore P is a point in the curve, and because PSH is a right angle, PH is a tangent. Cor. 1, Prop. 20.

Cor. Because two lines SQ, Sg , may be drawn from the point S to touch the circle; two tangents LP, Lp , may be drawn from L to the conic section.

PROP. XLI.

If a circle touches a conic section, and cuts off from the diameter, which passes through the point of contact, a segment equal to its parameter, the conic section is of the same curvature with the circle at the point of contact.

First let a tangent DM be drawn to any point D in the parabola, (fig. 62,) draw also the diameter DF , and the perpendicular DL : through any point Q in the curve, near to D , let the circle DQO be described to touch DM in D , and meet DF in P , join PQ, DQ , and draw QN parallel to MD , meeting DF in N . Then because the angle $DPQ = MDQ = DQN$, the triangles DNQ, PQD , having a common angle at D are equiangular; hence $PD:DQ::DQ:DN$, and $PD \times DN = DQ^2$: also $PD^2:PQ^2::DQ^2:QN^2$, therefore $PD^2:PQ^2::PD \times DN:P \times DN$, where P = parameter of DF . Now, it is evident, that the nearer the point Q is to the point D , the nearer will the circumference of the circle be to a coincidence with the curve at that point; and therefore, as no portion of these curves, however small, can be the same, the circumference of the circle will have approached the nearest possible to a coincidence with the curve at D , when the point Q falls upon it; in which case, the last analogy becomes $PD^2:PD^2::PD:P$, therefore $PD = P$, the parameter of DF ; therefore the proposition in the case of the parabola is manifest.

Next let DM be a tangent at any point in the ellipse or hyperbola, (fig. 63,) DF, EG , conjugate diameters, and DHO a perpendicular to the two parallels DM, EG .

Through any point Q in the curve, near to the point D , let the circle DQO be described, to touch DM in D , and meet DF in P . Let PQ, QD , be joined, and QN drawn parallel to DM , to

meet DF in N . The triangles DNQ, PQD , being similar, $DN:DQ::DQ:DP$, hence $DN:DP::DN^2:DQ^2$,

Or $DN:DP::QN^2:PQ^2$.

But $DF:P::FN \times ND:QN^2$, Prop. 32. Cor. 1.

Therefore $DF \times DN:P \times DP:FN \times DN:PQ^2$,

and $DF:FN::P \times DP:PQ^2$; this analogy, when Q coincides with D , becomes $DF:DF::P \times DP:DP^2$, in which case $P = PD$, where P = parameter of DF as before.

Cor. If, from any point D in an ellipse or hyperbola, a diameter DF be drawn, and a perpendicular DH to its conjugate EG , the radius of curvature at the point D is a third proportional to the perpendicular DH and the semi-conjugate diameter EC .

For since $DH:DC::DP:DO$,

and $DC:EC::EG:P$ or DP ;

therefore $DH:EC::EG:DO::EC:DH$, the radius of curvature.

PROP. XLII. FIG. 64.

If any ordinate and absciss of a parabola be completed into a parallelogram; the area of the parabola, included between the ordinate and the curve, is to the parallelogram as 2 to 3.

Let AN be the absciss, and PQ the ordinate; let the parallelogram $PQCB$ be completed, and let AN be divided into indefinitely small equal parts, of which ND is one; through D draw HI parallel to PQ , cutting the parabola in F and G , and through F draw KE parallel to NA ; take $KR = KP$, and draw RL parallel to KE . By Prop. 25, $HF \times HG:PN^2::HP:NA$, but because DN is indefinitely small, PQ or $2PN$ may be taken for HG ; and $PK = HF$, also $NA = PB$, therefore $2PK \times PN^2:PN::HP:PB$, and $2PK$, or $PR:PN::HP:PB$; now the parallelograms RB, PD , are equiangular; therefore they are equal, and the parallelogram $PD:KB::2:1$; and the sum of all the parallelograms in APN is to the sum of all those in APB in the same ratio of 2 to 1; but the sum of all the parallelograms in APN approaches indefinitely near to the curvilinear area AFP , when their breadths are continually diminished; and in like manner the sum of all the parallelograms in APB approaches to the curvilinear area AFP ; therefore area AFP :area AFP : $2:1$, and the area PAQ is to the parallelogram $PBCQ$ as 2 to 3.

PROP. XLIII. FIG. 65, 66.

If two ellipses or two hyperbolas have a common axis, and an ordinate be drawn through the same point in the axis to each of the curves; the areas included between the common absciss, the ordinates, and the two curves, also the whole areas of the ellipses will be to each other as the conjugate axes.

Let AP, AQ , be two ellipses or two hyperbolas; take any absciss AN , which is not greater than half the axis of the ellipse, and draw the ordinates NP, NQ . Let the absciss AN be divided into any number of equal parts AE, EF, FG, GN , &c.; draw the ordinates ERI, FSK, GTL , and complete the parallelograms AR, AI, ES, EK , &c. also draw Ii, Kk, Ll parallel to AN . Then it is evident that the difference between the circumscribed parallelograms AI, EK, FL, GQ , and the inscribed parallelograms Ei, Fk, Gl is equal to GQ ; and if parallelograms be inscribed in the same manner in the figure APN , the difference between these and the circumscribed parallelograms would be equal to GP , therefore the difference between each series of parallelograms, and the areas AQN, APN will be less than the parallelograms GQ, GP , and because $GP:GQ::NP:NQ$, and each parallelogram in the figure APN is to the corresponding parallelogram in the figure AQN in the same ratio, the sum of all those in APN is to the sum of all those in AQN as NP is to NQ , which is the same ratio with that of the conjugate axes. Conceive the breadths of the parallelograms to be now diminished, and their number increased ad infinitum, and the parallelograms APN, AQN will be ultimately equal to the areas APN, AQN , for the parallelograms GQ, GP will now vanish, therefore the areas APN, AQN are to each other as their conjugate axes; and if the sections be ellipses, their whole areas are to each other in the same ratio.

Cor. 1. If a circle be described about an ellipse, the area of the circle is to be the area of the ellipse as the transverse axis is to the conjugate.

Cor. 2. The area of an ellipse is equal to that of a circle whose diameter is a mean proportional between the two axes.

Cor. 3. The areas of two ellipses are to each other as the rectangles under their axes.

CONIFERÆ, in botany, the name of one of the orders of Linnaeus's fragments of a natural method, consisting of plants whose female flowers, placed at a distance from the male either on the same or distinct roots, are formed into a cone. Of this order are the *Abies*, *Cypressus*, &c. All the conifera yield a resin which renders most of them evergreen. The fruit in all is biennial, being produced in the spring, but not ripening and dropping its seeds until the spring after.

CONIGLIANO, a town of Italy, in the marquisate of Trevisano, and late Venetian territories; ceded by the French to the emperor, in 1797. Lon. 12. 40. E. Lat. 45. 50. N.

CONIL, a town of Spain, in Andalusia, 18 miles S. S. E. of Cadiz.

CONIN, or **KONIN**, a town of Poland, in the palatinate of Kalisch, 18 miles S. S. E. of Guesne.

CONINGSBECK, or **CONINGSECK**, a county of Germany, in the circle of Suabia.

CONINGSECK, the capital of the county, 20 miles N. of Constance. Lon. 9. 20. E. Lat. 47. 50. N.

CONJOINT DEGREES, in music, two notes which immediately follow each other in the order of the scale; as *ut* and *re*.

CONJOINT TETRACHORDS, two tetrachords, or fourths, where the same chord is the highest of one and the lowest of the other.

CONITZ, or **CHOINITZ**, a town of Poland, in Pomerellia, 40 miles S. of Dantzic.

CONJUGATE AXIS. See **CONIC SECTIONS**.

CONJUGATE HYPERBOLA. See **CONIC SECTIONS**.

CONJUGATION, [*conjugatio*, Lat.] in grammar, a regular distribution of the several inflexions of verbs in their different voices, moods, tenses, numbers, and persons, so as to distinguish them from one another. See **GRAMMAR** and **LANGUAGE**.

CONIUM, **HEMLOCK**: a genus of the digynia order, and pentandria class of plants; natural order, Umbellate. Partial involucre halved, mostly triphyllous; fruit subglobose, quinque-striated, the striæ crenated on each side. There are five species.

C. AFRICANUM, with prickly seeds, is a native of the Cape of Good Hope, and rarely grows above nine inches high; the lower leaves are divided like those of the small wild rue, and are of a greyish colour.

C. MACULATUM, or the greater hemlock, grows naturally on the sides of banks and roads in many parts of Britain. It is a biennial plant which perishes after it has ripened its seeds. It has a long taper root like a parsnip, but smaller. The stalks are terminated by umbels of white flowers, each composed of about ten rays or small umbels, and have a great number of flowers which spread open, each sitting upon a distinct footstalk; the seeds are small and channelled, and like those of anniseed. It flowers in June, and the seeds ripen in autumn. This species is sometimes applied externally, in the form of decoction, infusion, or poultice, as a discutient.

CONJUNCTION, in astronomy, the meeting of two stars or planets in the same degree of the zodiac. See **ASTRONOMY**.

CONJUNCTION, in grammar, an indeclinable word or particle, which serves to join words and sentences together, and thereby shews their relation or dependance one upon another. See **GRAMMAR**.

CONJURATION, properly implies magic words, characters, or ceremonies, whereby evil spirits, tempests, &c. are supposed to be raised, or driven away. The Romish priests pretend to expel devils, by preparing holy water in a particular manner, and sprinkling it over the possessed, with a number of conjurations and exorcisms. Some authors make the difference between conjuration and witchcraft to consist in this; that the former effects its end by prayers and invocation of God's name, &c. to compel the devil to do what is desired; so that the conjurer is supposed to be at war with the devil, and that evil spirit to act merely out of constraint: whereas the latter attains its end by an immediate application to the devil himself; and the devil's complaisance is supposed to be the consequence of some compact between them, so that the devil and the witch have a good understanding together. Both these, again, differ from enchantment and sorcery; in that these latter operate secretly and slowly by spells, charms, &c. without invoking the devil.

CONKERE, a town in Chinese Tartary. Lon. 102. 10. E. Lat. 44. 50. N.

CONLIE, a town of France, in the department of Sarthe, 10 miles N. W. of Mans.

CONNARUS, **CEYLON SUMACH**: a genus of the decandria order, and monodelphia class of plants. Stigma simple; capsule bivalved, unilocular, and monospermous. There are five species, natives of warm climates.

CONNAUGHT, the most western of the four provinces of Ireland, bounded on the E. by that of Leinster, on the W. by the ocean, on the N. and N. W. by part of the ocean and province of Ulster, and on the S. and S. E. by Munster. It is 130 miles long, and 84 broad; and was anciently a kingdom. It has no rivers of note, besides the Shannon. It has several convenient bays and creeks, and is fertile in many places. It contains five counties; viz. Leitrim, Sligo, Mayo, Roscommon, and Galway; which comprehend 1 archbishopric, 5 bishoprics, 7 market-towns, 8 places of trade, 10 boroughs, that send members to parliament, about 47,256 houses, 24 old castles, besides fortresses that have been recently erected, and 330 parishes. Galway is the chief town.

CONNAUX, a town of France, in the department of Gard, 9 miles N. E. of Uzes.

CONNECTICUT, a large river of North America, the most considerable one in the eastern part of the United States. It rises in the high lands which separate the states of Vermont and New Hampshire from Lower Canada. Its course is generally S. S. W. until it reaches the city of Middleton; after which it runs a S. S. E. course to its mouth.

CONNECTICUT, one of the United States of North America, called by the ancient natives Quannihctut, is situated between 41. 0. and 42. 2. lat. N. and between 71. 20. and 73. 15. lon. W. Its greatest breadth is 72 miles, its length 100 miles. It is bounded on the N. by Massachusetts, on the E. by Rhode Island; on the S. by the sound which divides it from Long Island, and on the W. by the state of New York. This state contains about 4674 square miles; equal to about 2,640,000 acres. Connecticut, though subject to the extremes of heat and cold, as well as to frequent and sudden changes, is very healthful. From accurate calculation it is found, that about one in eight live to the age of seventy and upwards; one in thirteen to eighty, and one in about thirty to ninety years of age. In the maritime towns the weather is variable, according as the wind blows from the sea or land. In the inland country it is less variable. Its principal productions are Indian corn, rye, wheat, oats, and barley, which are heavy and good; buck wheat, flax, hemp, potatoes of several kinds; pumpkins, turnips, peas, beans, and fruits of all kinds. The soil is well calculated for pasture and hay, which enables the farmers to feed large numbers of neat cattle and horses. The beef, pork, butter, and cheese, of Connecticut, are equal to any in the world. Connecticut is divided into eight counties, viz. Hartford, New Haven, New London, Fairfield, Windham, Litchfield, Middlesex, and Tolland. The counties are subdivided into upwards of 100 townships; each of which is a corporation, invested with power to hold lands, choose their own officers, to make prudential laws, the penalty of transgression not to exceed 20s. and to choose their own representatives to the general assembly.

CONNECTIVES, in grammar, one of the four species under which, according to Mr. Harris, all words may be included. They are of two kinds; and as they connect sentences or words, are called by the different names of conjunctions and prepositions. See **GRAMMAR**.

CONNELS, a town of the United States, in Pennsylvania, 25 miles W. S. W. of Chambersburg.

CONNERE, a town of France, in the department of Sarthe, 12 miles E. N. E. of Mans.

CONNEXION, the relation whereby one thing adheres to, or depends upon, another. Such is the relation between Euclid's propositions, that the latter cannot subsist but by its connexion with the former.

CONNEXION, or **CONTINUITY**, in the drama, consists in the joining of the several scenes together. The connexion is said to be observed, when the scenes of an act succeed one another immediately, and are so joined as that the stage is never left empty.

CONNIVENTES VALVULÆ, or **CONNIVENT VALVES**, in anatomy, wrinkles, cellules, and vasculæ, in the inside of the ilium and jejunum. See **ANATOMY**.

CONNOISSEUR, [from *connoître*, French, to know,] literally signifies a person well versed in any thing; and is used for

MISCELLANIES.

one who is a thorough judge in any science, but particularly painting and sculpture.

CONNOR, a town of Ireland, in the county of Antrim, 6 miles N. of Antrim.

CONNOR, BERNARD, M. D. and F. R. S. was born in Kerry, Ireland, about A. D. 1666. He studied physic in the university of Montpellier: and afterwards went to Paris. From thence he travelled to Venice, and through great part of Germany, to Warsaw, where he was made physician to king John Sobieski. In 1695, he came to England, read lectures in London, Oxford, and Cambridge, and became member of the Royal Society and College of Physicians. He wrote a singularly philosophical and medical treatise in Latin, entitled "Evangelium Medici," i. e. the Physician's Gospel; wickedly pretending to explain the miracles performed by Christ as natural events, upon the principles of natural philosophy. He wrote also "A History of Poland;" "Dissertations on Mount Vesuvius," &c. and died in 1698, aged 32.

CONOCARPUS, BUTTON TREE: a genus of the monogynia order, and pentandria class of plants; natural order, Aggregate. Corolla pentapetalous; seeds naked, solitary, inferior; flowers aggregate. There are three species, natives of the West Indies.

CONOID, a figure generated by the revolution of a conic section about its axis; there are, consequently, three kinds, answering to the three conic sections, viz. the elliptical conoid, or spheroid, the hyperbolic conoid, and the parabolic conoid. If a conoid be cut by a plane in any position, the section will be of the figure of some one of the conic sections; and all parallel sections of the same conoid are like and similar figures.

CONOIDES, the pineal gland. See **ANATOMY**.

CONON, a renowned Athenian general and admiral, who flourished about B. C. 395. After his defeat by Lysander, he fled to Evagoras king of Cyprus: after which he put himself under the protection of Artaxerxes king of Persia; with whose army he delivered Athens from his oppressors, and rebuilt its walls. In the 360th year of Rome, he beat the Lacedæmonians in a sea-fight near Cnidus upon the coast of Asia, deprived them of the sovereign rule they had on sea ever since the taking of Athens, and had some other considerable advantages over them: but falling into the hands of Teribazus, a Persian, who envied his glory, he was put to death.

CONOPEA, in botany, a genus of the class didynamia, and order angiosperma. Calyx five-cleft; corolla ringent, two-lipped; stigma two-lobed; capsule one-celled, four-valved; seeds many. One species, a native of Guiana.

CONOPOLI, a town of European Turkey, in Livadia, 10 miles N. E. of Lepanto.

CONOPS, in zoology, a genus of insects of the order diptera. Rostrum pored, and jointed like a knee; antennæ terminated by a flat and solid articulation, resembling the bowl of a spoon, with a lateral bristle. Twenty-two species are enumerated.

CONOU, a town of Persia, in Lariston, on the coast of the Persian Gulf, 66 miles E. S. E. of Lar.

CONQUES, a town of France, in the department of Aveiron, 18 miles N. of Rhodéz.

CONQUEST, in civil jurisprudence, is the acquisition of property in common by a number of persons. In some countries they confound acquisition with conquest; but, according to the most general acceptation, acquisition is the gaining of unappropriated goods before the establishment of a community: whereas by the term conquest, is ordinarily intended whatever is acquired by a number of persons in community; or by some one for all the others. As it is more especially in the union of persons by marriage that a community of property takes place; so it is in reference to them that we frequently use the word conquest. There are nevertheless conquests also among other persons who are in a tacit community or society; such as obtain by particular local customs. According to this sense of the word, it has been contended by several, that William I. claimed the kingdom of England; that is, not by right of arms but by right of conquest or acquisition; under promise of succession made by Edward the Confessor, and a contract entered into by Harold to support his pretensions to that succession; and by old writers, conquestus, acquisitio, and perquisitio, are frequently used as synonymous terms.

CONQUEST, in the law of nations. The right of conquest is derived from the laws of war; and when a people is subjected,

the conduct of the conqueror is regulated by four kinds of law. First, the law of nature, which dictates whatever tends to self-preservation; 2dly, our reason, which teaches us to use others, as we would be treated ourselves; 3dly, the laws of political society, to which nature has not assigned any precise boundary; lastly, the law which is derived from the particular circumstances attending the conquest. Thus, a state conquered by another will be treated in one of the four methods following: Either the conqueror will continue it under its own laws, and will only claim the exercise of civil and ecclesiastical sovereignty; or he will impose a new form of government; or he will destroy the frame of their society, and incorporate the inhabitants with others; or he will exterminate them: which last, to the disgrace of human nature, has been too often done.

CONQUET, a town of France in the department of Finisterre, 12 miles W. of Brest.

CONSANGUINITY, or **KINDRED**, is either lineal or collateral.

CONSANGUINITY, COLLATERAL, agrees with the lineal in this, that the collateral relations descend from the same ancestor; but differs in this, that they do not descend the one from the other. Collateral kinsmen are such as lineally spring from one and the same ancestor, who is the stirps or root, the stirps, trunk, or common stock, from whence these relations are branched out. Thus if Daniel Gogerly has two sons, who have each a numerous issue, both these issues are descended from Daniel Gogerly as their common ancestor; and they are collateral kinsmen to each other, because they are all descended from this common ancestor, and all have a portion of his blood in their veins, which denominates them consanguineous. Collateral consanguinity consists in this descent from one and the same common ancestor. Thus Daniel Gogerly and his brother George are related, because both are derived from one father. George and his first cousin are related, because both descend from the same grandfather; and his second cousin's claim to consanguinity is, that they are both derived from the same great-grandfather. In short, as many ancestors as a man has, so many common stocks he has from which collateral kinsmen may be derived. And as we are taught by holy writ, that there is one couple of common ancestors belonging to us all, from whom the whole race of mankind is descended, the obvious and undeniable consequence is, that all men are in some degree related to one another. For, indeed, if we only suppose each couple of our ancestors to have left, one with another, two children; and each of those children to have left, on an average, two more, (and without such a supposition the human species must be daily diminishing); we shall find that each of us now subsisting has above 268 millions of kindred in the 15th degree, at the same distance from the several common ancestors as we ourselves are, and in the 20th degree no fewer than 274,877,906,944: besides those that are one or two degrees nearer to or farther from the common stock, who may amount to as many more. And if this calculation should appear incompatible with the number of inhabitants on the earth, it is because, by inter-marriages among the several descendants from the same ancestor, a hundred or a thousand modes of consanguinity may be consolidated in one person; or he may be related to us a hundred or a thousand different ways. The method of computing these degrees in the canon law, which we have adopted, is as follows. We begin at the common ancestor, and reckon downwards; and in whatsoever degree the two persons, or the most remote of them, is distant from the common ancestor, that is the degree in which they are related to each other. Thus, George and his brother are related in the first degree; for from the father to each of them is counted only one: George and his nephew are related in the second degree; for the nephew is two degrees removed from the common ancestor, viz. his own grandfather, the father of George. To give an instance from the English annals: King Henry VII. who slew Richard III. in the battle of Bosworth, was related to that prince in the fifth degree. Let the propositus, therefore, in the table of consanguinity, represent Richard III. and the class marked E, Henry VII. Now their common ancestor was Edward III. the abavus in the same table: from him to Edward duke of York, the proavus is one degree; to Richard earl of Cambridge, the avus, two; to Richard duke of York, the pater, three; to king Richard III. the propositus, four; and from king Edward III. to John of Gaunt (A) is one degree; to John E. of Somerset (B) two; to John duke of Somerset (C) three; to Mar-

garet countess of Richmond (D) four; to king Henry VII. (E) five; which last mentioned prince, being the farthest removed from the common stock, gives the denomination to the degree of kindred in the canon and municipal law: Though according to the computation of the civilians, (who count upwards from either of the persons related to the common stock, and then downwards again to the other; reckoning a degree for each person both ascending and descending,) these two princes are related in the ninth degree; for from king Richard III. to Richard duke of York is one degree; to Richard earl of Cambridge two; to Edmund duke of York three; to king Edward III. the common ancestor, four; to John of Gaunt five; to John earl of Somerset, six; to John duke of Somerset, seven; to Margaret countess of Richmond, eight; to king Henry VII. nine. See the Table of Consanguinity, Plate LI, wherein all the degrees of collateral kindred to the propositus are computed, as far as the 14th of the civilians and the ninth of the canonists inclusive; the former being distinguished by numeral letters, the latter by common figures.

CONSANGUINITY, LINEAL, is that which subsists between persons of whom one is descended in a direct line from the other; as between John Stocks, the propositus in the table of consanguinity (See Plate LII,) and his father, grandfather, great-grandfather, and so upwards in the direct ascending line; or between John Stocks and his son, grandson, great-grandson, and so downwards in the direct descending line. Every generation, in this direct lineal consanguinity, constitutes a different degree, reckoning either upwards or downwards; the father of John Stocks is related to him in the first degree, and so likewise is his son; his grandsire and grandson in the second; his great-grandsire and great-grandson in the third. This is the only natural way of reckoning the degrees in the direct line; and therefore universally obtains, as well in the civil and canon, as in the common law. This lineal consanguinity falls strictly within the definition given by lawyers, of *vinculum personarum, ab eodem stipite descendit*; as lineal relations descend one from the other, and both of course from the same common ancestor. The doctrine of lineal consanguinity is sufficiently obvious; but it is astonishing to consider the number of lineal ancestors which every man has, within no very great number of degrees: and so many different bloods is a man said to contain in his veins, as he has lineal ancestors. Of these he has two in the first ascending degree, his own parents; he has four in the second; the parents of his father, and the parents of his mother: he has eight in the third, the parents of his two grandfathers, and of his two grandmothers; and, by the same rule of progression, he has 128 in the seventh; 1024 in the tenth; and at the 20th degree, or the distance of twenty generations, every person has above a million of ancestors, as common arithmetic will demonstrate. This will seem surprising to those who are unacquainted with the increasing power of progressive numbers; but is palpably evident from the annexed table, in which the first term is two, and the denominator also two; for each of us has two ancestors in the first degree, the number of whom is doubled at every remove; because each of our ancestors has also two immediate ancestors of his own.

A shorter way of finding the number of ancestors at any even degree, is by squaring the number of ancestors at half that number of degrees. Thus 16 the number of ancestors at four degrees, is the square of four, the number of ancestors at two; 256 is the square of 16; 65536 of 256; and the number of ancestors at 40 degrees would be the square of 1,048,576, or upwards of a million of millions. But notwithstanding these calculations are numerically just, they cannot be supposed to be strictly true of every individual. On the contrary, we are certain from the vast number of intermarriages, that have taken place among consanguineous relations in all ages and countries, that such estimates must be greatly beyond the truth with regard to a great majority of mankind. For instance, if a man's father and mother are cousins german, the son and daughter of two brothers, it is plain, that though he has two grandfathers, he has not four great-grandfathers, but only three. And on this principle, a Jew or Bramin, whose ancestors, for twenty generations, have constantly intermarried within their own tribe, or cast, must have fewer ancestors by many thousands, than a person whose ancestors were under no such restriction by law or custom. And we are certain that the patriarch

Noah, although he might have had 32 ancestors in the 5th degree, had in fact only two in the tenth. Admitting every deduction, however, for the identity of particular ancestors, by intermarriages among near relations, still the number of lineal ancestors, which every individual has, must be allowed to be very great.

CONSAR, a town of Persia, in the province of Irak, 52 miles N. W. of Ispahan.

CONSBACH, a town of Sweden, in S. Gothland, 32 miles N. of Wardbeg.

CONSCIENCE, [*conscientia*, Latin.] the knowledge or faculty by which we judge of the goodness or wickedness of ourselves.

CONSCIENCE, in ethics, the moral sense. See MORAL PHILOSOPHY.

CONSCIENCE COURTS OF, are courts of recovery of small debts, constituted by act of parliament in London, Westminster, &c. and other populous and trading districts.

CONSECRATION, a rite or ceremony of dedicating and devoting things or persons to the service of God, with an application of certain proper solemnities.

CONSECRATION is also used for the benediction of the elements in the eucharist.

CONSECRATION, in Jewish antiquity, the Mosaic law ordained, that all the first-born, both of men and beasts, should be sanctified or consecrated to God. We find also, that Joshua consecrated the Gibeonites, as David and Solomon did the Nethinims, to the service of the temple; and that the Hebrews sometimes consecrated their fields and cattle to the Lord, after which they were no longer in their power.

CONSECRATION, among antiquaries, is the representation on medals of the apotheosis of an emperor, or his translation among the gods. On one side is the emperor's head, crowned with laurel, sometimes veiled; and the inscription gives him the title of *divus*: on the reverse is a temple, a bustum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus. Sometimes the emperor is seen in the air, born up by the eagle; the inscription always consecratio. These are the usual symbols; yet on the reverse of that of Antoninus is the Antonine column. In the apotheoses of empresses, instead of an eagle there is a peacock.

CONSECRATION OF CHURCHES, &c. Among the ancient Christians, the consecration of churches was performed with a great deal of pious solemnity. In what manner it was done for the three first ages, is uncertain; the authentic accounts reaching no higher than the fourth, when in the peaceable reign of Constantine, churches were every where built, and dedicated with great solemnity. Some think the consecration consisted in setting up the sign of the cross, or in placing a communion table in the church; and others, that no more was done than preaching a panegyric sermon in commemoration of the founder, and that then they proceeded to prayers one of which was composed on purpose for the church to be consecrated. The Romanists have a great deal of foppery in the ceremonies of consecration; which they bestow on almost every thing, as bells, candles, books, water, oil, ashes, palms, swords, banners, pictures, crosses, agnus-dei's, roses, children's clouts, &c. In England, churches have been always consecrated with particular ceremonies, the form of which was left to the discretion of the bishop. That observed by archbishop Laud, in consecrating St. Catherine's church, in London, gave great offence.

CONSECTARY, deduction from premises; consequence; corollary. See COROLLARY.

CONSENT OF PARTS, in the animal economy, an agreement or sympathy, whereby, when one part is immediately affected, another at a distance becomes affected in the same manner. This mutual accord or consent is supposed to be effected by the commerce of the nerves, and their ramification throughout the body. The effect is so sensible as even to come under the physicians cognizance: the remedy, therefore, in such cases, is to regard the part originally affected, how remote and grievous soever may be the consequences and symptoms in other places. The fifth conjugation of nerves branched to the parts of the eye, the ear, those of the mouth, cheeks, præcordia, and parts adjacent, &c. is supposed by naturalists to be the instrument of that particular and extraordinary consent between those parts. Hence a savoury thing seen or smelled excites the appetite, and affects the glands and parts

parts of the mouth; that a shameful thing seen or heard affects the cheeks with blushes; on the contrary, if it please, it affects the præcordia, and excites the muscles of the mouth and face to laughter; if it grieve, it affects the glands of the eyes, so as to occasion tears, and the muscles of the face, putting them into an aspect of crying. Dr. Willis, quoted by Mr. Derham, imputes the pleasure of kissing, and its effects, to this pair of nerves; which being branched both to the lips and the genital parts, when the former are affected an irritation is occasioned in the latter. See SYMPATHY.

CONSENTES, in Roman antiquity, the twelve superior gods, or Dii majorum gentium. The word signifies as much as consentientes; that is, who consented to the deliberations of Jupiter's council. Ennius has briefly expressed their names in these lines,

Juno, Vesta, Minerva, Ceres, Diana, Venus, Mars,
Mercurius, Jovi, Neptunus, Vulcanus, Apollo,

CONSENZA, a town of Naples, in Calabria Citerior, anciently called Consentia, 16 miles from the coast. Lou. 16. 39. E. Lat. 39. 25. N.

CONSEQUENCE, [*consequentia*, Lat.] in logic, the conclusion, or what results from reason or argument. See CONCLUSION. The consequence is that other proposition in which the extremes or premises of a syllogism are joined or separated; and is gained from what was asserted in the premises. This word, in a more restrained sense, is used for the relation or connection between two propositions, whereof one is inferred from the other.

CONSEQUENT, something deduced or gathered from a former argumentation. But, in a more precise sense, it is used for the proposition which contains the conclusion, considered in itself, without any regard to the antecedent: in which sense the consequent may be true, though the consequence be false. See the preceding article.

CONSEQUENT OF A RATIO, in mathematics, the latter of the two terms of a ratio, or that to which the antecedent is compared; thus in $m : n$, or m to n , n is the consequent, and m the antecedent. See the articles RATIO and PROPORTION.

CONSERANS, a territory of France, being the S. W. division of the late province of Gascony.

CONSERVATOR, an officer ordained for the preservation of the privileges of some cities and communities, having a commission to judge of and determine the differences among them. In most catholic universities there are two conservators; the conservator of royal privileges, or those granted by kings; and the conservator of apostolical privileges, or those granted by the pope. The first takes cognizance of personal and mixed causes between the regents, students, &c. and the latter of spiritual matters between ecclesiastics.

CONSERVATOR OF SCOTS PRIVILEGES, AT CAMPVERE, an officer belonging to the royal boroughs of Scotland, who before the late revolution in the United Dutch States, took care of the mercantile affairs of Scotland, agreeably to the staple contract between them and the States-General.

CONSERVATOR OF THE PEACE, in the ancient English customs, was a person who had a special charge, by virtue of his office, to see the king's peace kept. Till the erection of justices of the peace by king Edward III. there were several persons who by common law were interested in keeping the same: some having that charge as incident to other offices; and others simply, or of itself, called custodes, or conservators of the peace.

CONSERVATOR OF THE TRUCE, AND SAFE CONDUCTS, was an officer appointed in every sea-port, under the king's letters patent. His charge was to enquire of all offences committed against the king's truce, and safe conducts upon the main sea, out of the franchises of the cinque-ports, as the admirals were wont to do, and such other things as are declared anno 3 Hen. V. cap. 6.

CONSERVATORIO, a musical school for the instruction of children in the profession of music. There are four of these at Venice, for the education of girls, and three at Naples, for that of boys.

CONSERVE, in pharmacy, a form of medicine contrived to preserve the flowers, herbs, roots, or fruits of several simples, as near as possible to what they were when fresh gathered. See PHARMACY.

CONSIDERATION, in law, the material cause or ground of a contract, without which the party contracting would not be bound.

CONSIGLIONE, a town of Sicily, in the valley of Mazar, 19 miles S. of Palermo.

CONSIGNMENT, in law, the depositing of any sum of money,

goods, papers, or commodities, in good hands; either by appointment of a court of justice, in order to be delivered to the persons to whom they are adjudged: or voluntarily, in order to their being remitted to the persons they belong to, or sent to the places they are designed for.

CONSIGNMENT OF GOODS, in commerce, is the delivering or making of them over to another; thus, goods are said to be consigned to a factor, when they are sent to him to be sold, &c. or when a factor sends back goods to his principal, they are said to be consigned to him.

CONSISTENCE, in physics, that state of a body wherein its component particles are so connected or entangled among themselves, as not to separate or recede from each other. It differs from continuity in this, that it implies a regard to motion or rest, which continuity does not, it being sufficient to denominate a thing continuous that its parts are contiguous to each other.

CONSISTENTES, in church-history, a kind of penitents who were allowed to assist at prayers, but who could not be admitted to receive the sacrament.

CONSISTORY, signifies as much as prætorium, a tribunal; it is commonly used for a council-house, session, or assembly of ecclesiastics.

CONSISTORY, is particularly used for the pope's senate and council, before whom judiciary causes were pleaded at Rome. This consistory, or College of Cardinals, (as it is also called) was the first court of tribunal at Rome before the revolution of the 15th Feb. 1798. It never met but when the pope pleased to convoke it: he presided in person mounted on a magnificent throne, and habited in his pontificalia; on the right sat the cardinal bishops and priests, and on the left the cardinal deacons. The place where it was held, was a large hall in the apostolical palace, where princes and ambassadors were received. The other prelates, protonotaries, auditors of the rota, and other officers were seated on the steps of the throne: the courtiers sat on the ground; ambassadors on the right, and consistorial and fiscal advocates behind the cardinals. Besides the public consistory, there was also a private one, held in a retired chamber, called the chamber of papegay; the pope's throne being only raised two steps. Nobody was admitted but the cardinals, whose opinions were collected, and called sentences.

CONSISTORY was also used among the reformed, for a council or assembly of ministers and elders, to regulate their affairs, discipline, &c.

CONSISTORY, or COURT, CHRISTIAN, in the English laws, is a council of ecclesiastical persons, or the place of justice in an ecclesiastical or spiritual court. Every archbishop and bishop has a consistory court, held before his chancellor or commissary, either in his cathedral, in some chapel, aisle, or portico, or in some other convenient place of his diocese, for ecclesiastical causes.

CONSOLATION, in rhetoric, one of the points, wherein the orator endeavours to moderate the grief of another.

CONSOLE, in architecture, an ornament cut upon the key of an arch, which has a projecture, and, on occasion, serves to support little corniches, figures, busts, and vases. They are also called mutules and modillions, according to their form.

CONSONANCE, in music, is ordinarily used in the same sense with concord, viz. for the union or agreement of two sounds, produced at the same time, the one grave and the other acute; which mingling in the air in a certain proportion, occasion an accord agreeable to the ear. See CONCORD.

CONSONANT, [*consonans*, Lat.] a letter which cannot be sounded, or but imperfectly, by itself.

CONSONANTS are divided into mutes and liquids; and subdivided into labials, dentals, &c. See GRAMMAR.

CONSPIRACY, in law, signifies an agreement between two or more, falsely to indict, or procure to be indicted, an innocent person of felony.

CONSPIRATORS are, by statute, defined to be such as bind themselves by oath, covenant, or other alliance, to assist one another falsely and maliciously to indict persons, or falsely to maintain pleas.

CONSPIRATORS in treason, are those that plot against the king and the government.

CONSPIRING POWERS, in mechanics, all such as act in direction not opposite to one another.

CONSTABLE, [from *comes stabuli*,] an officer anciently well known.

known in the empire; so called, because, like the great constable of France, (an office suppressed by Lewis XIII.) as well as the lord high constable of England, he was to regulate all matters of chivalry, tilts, tournaments, and feats of arms, which were performed on horseback.

CONSTABLE, LORD HIGH, OF ENGLAND, is the 7th great officer of the crown; and he with the earl marshal of England, were formerly judges of the court of chivalry, called in king Henry IV.'s time *Curia Militaris*, and now the court of honour. It is the fountain of the martial law, and anciently was held in the king's hall. The power of the lord high constable was formerly so great, and of which so improper a use was made, that so early as the 13th of king Richard II. a statute passed for regulating and abridging it, together with that of the earl marshal of England; and by this statute, no plea could be tried by them or their courts, that could be tried by the common law of the realm. The office of constable is said to have existed before the conquest. After the conquest, the office went with inheritance, and by the tenure of the manors of Harlefield, Newham, and Whitenhurst, in Gloucestershire, by grand sergeantry, in the family of the Bohuns earl of Hereford and Essex, and afterwards in the line of Stafford as heirs general to them; but in 1521, this great office became forfeited to the king in the person of Edward Stafford duke of Buckingham, who was that year attainted for high treason; and in consideration of its extensive power, dignity, and large authority, both in war and peace, it has never been granted to any person, otherwise than *hac vice*, to attend at a coronation, or trial by combat.

CONSTABLE, LORD HIGH, OF SCOTLAND, is an office of great antiquity and dignity. The first upon record is Hugo de Morville in the reign of David I. He has two grand prerogatives, viz. 1. The keeping of the king's sword, which the king, at his promotion, when he swears fealty, delivers to him naked. Hence the badge of the constable is a naked sword. 2. The unlimited command of the king's armies in the field, in the absence of the king; but this command did not extend to castles and garrisons. He was likewise judge of all crimes committed within two leagues of the king's house, which precinct was called the Chalmers of Peace.

CONSTABLES, INFERIOR. From the great office of high constable is derived that inferior order, since called the constables of hundreds and franchises; these were first ordained in the 13th year of Edward I. by the statute of Winchester: which, from the conservation of the peace, and view of armour, appointed that two constables should be chosen in every hundred and franchise. These are what we now call *constabularii capitales* or High Constables; because continuance of time, and increase of people, &c. have occasioned others of like nature, but inferior authority, in every town, called petty constables, or sub-constabularii, first instituted about the reign of Edward III. The former, or modern high constables, are appointed at the court leets of the franchise or hundred over which they preside; or, in default of that, by the justice at their quarter sessions; and are removeable by the same authority that appoints them. The petty constables have two offices united in them, the one ancient and the other modern. Their ancient office is that of head-borough, tithing-man, or bors-holder; who are as ancient as the time of king Alfred; their more modern office is that of a constable merely: which was appointed so lately as the reign of Edward III. to assist the high constable. And in general the ancient head-boroughs, tithing-men, and bors-holders, were made use of to serve as petty constables; though not so generally, but that in many places they still continue distinct officers from the constables. They are all chosen by the jury at the court-leet; or if no court-leet be held, are appointed by two justices of the peace. The general duty of all constables, both high and petty, as well as the other officers, is to keep the king's peace in their several districts; and to that purpose they are armed with very large powers of arresting and imprisoning, of breaking open houses and the like; of the extent of which powers, considering what manner of men are for the most part put upon these offices, it is perhaps very well they are generally kept in ignorance. One of their principal duties arising from the statute of Winchester, which appoints them, is to keep watch and ward in their respective jurisdictions. The constable may appoint watchmen at his discretion, regulated by the custom of the place; and these, being his deputies, have, for the time being, the authority of their principal.

CONSTADT, a town of Silesia in the principality of Oels, 13 miles E. S. E. of Namslau.

CONSTANCE, a strong town of Germany, in the circle of Suabia, seated between two lakes, 35 miles N. E. of Zurich. Lon. 9: 10. E. Lat. 47. 38. N.

CONSTANCE, LOWER, or ZELLER ZEE, a lake between Germany and Switzerland, 16 miles long and 10 broad.

CONSTANCE, UPPER, or BADEN ZEE, a large lake between Germany and Switzerland, 45 miles long and 18 broad. The Rhine runs through both it and the lower lake.

CONSTANCY, in ethics, implies steadiness, particularly under sufferings. It was the saying of a heathen philosopher, That there cannot be imagined upon earth a spectacle more worthy the regard of the Creator, than a brave man superior to his sufferings. Nothing indeed can be more honourable than to have courage to execute the commands of reason and conscience; and to be proof against poverty, pain, and death itself, so far as not to do any thing that is scandalous or sinful to avoid them. Of this virtue the following example is selected, as at least equal to any other upon record; though the martyrology of Scotland furnishes many not inferior. Sir William Askew of Kelsay, in Lincolnshire, had several daughters. His second, named Anne, had received a genteel education; which, with an agreeable figure and good understanding, rendered her a very proper person to be at the head of a family. Her father, regardless of his daughter's inclination and happiness, obliged her to marry a gentleman who had nothing to recommend him but his fortune, and who was a most bigoted Papist. No sooner was he convinced of his wife's regard for the doctrines of the reformation, than, by the instigation of the priests, he violently drove her from his house, though she had born him two children, and her conduct was unexceptionable. Abandoned by her husband, she came up to London, to procure a divorce, and make herself known to that part of the court who either professed or were favourers of Protestantism; but as Henry VIII. had just enacted the law of the six articles, commonly called the bloody statute, she was cruelly betrayed by her own husband; and, upon his information, taken into custody, and examined concerning her faith. The act denounced death against all who should deny transubstantiation; or, maintain the necessity of receiving the sacrament in both kinds; or affirm, that it was lawful for priests to marry; that the vows of celibacy might be broken; that private masses were of no avail; and that auricular confession to a priest was not necessary to salvation. Upon these articles she was examined by the inquisitor, a priest, the lord mayor of London, and the bishop's chancellor; and to all their queries gave proper answers; but not being such as they approved, she was sent back to prison, where she remained eleven days alone, being denied the small consolation of a friendly visit. The king's council being at Greenwich, she was once more examined by chancellor Wriothesley, Gardiner bishop of Winchester, Dr. Cox, and Dr. Robinson; but not being able to convince her of her supposed errors, she was sent to the tower. Mr. Strype, from an authentic paper, gives the following short account of her examination:—"Sir Martin Bowes (lord mayor) sitting with the council, as most meet for his wisdom, and seeing her stand upon life and death, I pray you, quoth he, my lords, give me leave to talk to this woman? Leave was granted. *Lord Mayor.* Thou foolish woman, sayest thou that the priest cannot make the holy body of Christ? *A. Askew.* I say so, my lord: for I have read that God made man; but that man made God I never read; nor I suppose ever shall read it. *L. M.* No! Thou foolish woman, after the words of consecration, is it not the Lord's body? *A. A.* No: it is but consecrated bread, or sacramental bread. *L. M.* What if a mouse eat it after consecration; what shall become of this mouse? what sayest thou, thou foolish woman? *A. A.* What shall become of her, say you, my lord? *L. M.* I say, that the mouse is damned. *A. A.* Alack, poor mouse!" Perceiving that some could not keep in their laughing, the council proceeded to the butchery and slaughter that they intended before they came there. It was strongly suspected, that Mrs. Askew was favoured by some ladies of high rank; and that she carried on a religious correspondence with the queen. So that the chancellor Wriothesley, hoping that he might discover something that would afford matter of impeachment against that princess, the Earl of Hertford, or his countess, who all favoured reformation, ordered her to be put to the rack; but her fortitude in suffering, and her resolution

not to betray her friends, was proof against that diabolical invention. Not a groan, not a word, could be extorted from her. The chancellor, provoked with what he called her obstinacy, augmented her tortures with his own hands, and with unheard of violence: but her courage and constancy were invincible; and these barbarians gained nothing by their cruelties but everlasting disgrace and infamy. As soon as she was taken from the rack, she fainted away; but being recovered, she was condemned to the flames. Her bones were dislocated in such a manner, that they were forced to carry her in a chair to the place of execution. While she was at the stake, letters were brought her from the lord chancellor, offering her the king's pardon if she would recant. But she refused to look at them; telling the messenger, that "she came not thither to deny her Lord and Master." The same letters were also tendered to three other persons condemned to the same fate; and who, animated by her example, refused to accept them. Whereupon the lord mayor commanded the fire to be kindled; and with savage ignorance cried out, *Fiat justitia*, "Let justice take its course." The faggots being lighted, she commended her soul, with the utmost composure, into the hands of her Maker; and, like the great founder of the religion she professed, expired, praying for her murderers, July 16, 1546, about the 25th year of her age.

CONSTANTIA, a district at the Cape of Good Hope, consisting of two farms, which produce the well known wine so much prized in Europe, and known by the name of Cape or Constantia wine.

CONSTANTINA, a territory of Africa, in the kingdom of Algiers.

CONSTANTINA, the capital of the above territory, 75 miles from the sea. Lon. 7. 12. E. Lat. 36. 4. N.

CONSTANTINA, a small territory of Spain, in Andalusia.

CONSTANTINA, the capital of the above territory. Lon. 5. 35. W. Lat. 37. 40. N.

CONSTANTINE, the name of 13 emperors of the East. There is a strange inaccuracy among authors in enumerating the emperors of this name. Some make only IX; others X; Alstedius reckons XI; Marcel and other good chronologists enumerate XIII; while almost all of them occasionally blunder in their numbers, when applied to particular emperors.

CONSTANTINE I. surnamed the Great, the first emperor of the Romans who embraced Christianity. Dr. Anderson in his *Royal Genealogies*, makes him not only a native of Britain, but the son of a British princess. It is certain that his father Constantius Chlorus, was at York, when, upon the abdication of Dioclesian, he shared the Roman empire with Galerius Maximinus in 305, and that he died in York, in 306; having first caused his son Constantine to be proclaimed emperor by his army, and by the Britons. Galerius at first refused to admit Constantine to his father's share in the imperial throne; but after having lost several battles, he consented in 308. Maxentius, who succeeded Galerius, opposed him; but was defeated, and drowned himself in the Tiber. The senate then declared Constantine first Augustus, and Licinius his associate in the empire, in 313. These princes published an edict, in their joint names, in favour of the Christians: but soon after Licinius, jealous of Constantine's renown, conceived an implacable hatred against him, and renewed the persecutions against the Christians. This brought on a rupture between the emperors, and a battle, in which Constantine was victorious. A short peace ensued; but Licinius having shamefully violated the treaty, the war was renewed when Constantine totally defeating him, he fled to Nicomedia, where he was taken prisoner and strangled in 323. Constantine, now becoming sole master of the whole empire, immediately formed the plan of establishing Christianity as the religion of the state; for which purpose he convoked several ecclesiastical councils: but finding he was likely to meet with great opposition from the Pagan interest at Rome, he conceived the design of founding a new city, to be the capital of his empire. See **CONSTANTINOPLE**. Constantine now displayed his regard for the religion which he had adopted, by building numerous churches, and taking a journey to Jerusalem to visit the holy sepulchre. In the Holy Land he erected a church at Bethlehem. At this time the Christian world was disturbed by the disputes between the orthodox and the Arians. At the head of the first stood Athanasius, to whom Constantine shewed but little favour, and consented to his banishment;

but afterwards he condemned the doctrines of Arius, and adhered to the Nicene confession. He poured a flood of wealth on the Christian world. With this zeal for religion he blended courage and justice. He performed many actions that entitled him to the name of Great. In 332, the Sarmatians implored his assistance against the Goths, who had made an irruption into their territories, and destroyed every thing with fire and sword. The emperor readily granted their request, and gained a complete victory. Near 100,000 of the enemy perished, either in the battle, or after it, with hunger and cold. In consequence of this overthrow, the Goths were obliged to sue for peace; but the ungrateful Sarmatians no sooner found themselves delivered from their enemies, than they turned their arms against their benefactor, and ravaged the provinces of Masia and Thrace. The emperor, receiving intelligence of this treachery, returned with incredible expedition, cut great numbers of them in pieces, and obliged the rest to submit. Constantine seems to have been a prince very highly respected, even by far distant nations. In 333, according to Eusebius, ambassadors arrived at Constantinople from the Blemies, Indians, Ethiopians, and Persians, courting his friendship. They were received in a most obliging manner; and learning from the ambassadors of Sapor, king of Persia, that there were great numbers of Christians in their master's dominions, Constantine wrote a letter in their behalf to the Persian monarch. Next year, the Sarmatians being attacked by the Goths, found themselves obliged to arm their slaves against them. They thus overcame the Goths: but the victorious slaves turning their arms against their masters, drove them out of the country. This misfortune obliged them, to the number of 300,000, to apply for relief to the emperor, who incorporated with his legions such as were capable of service; and gave settlements to the rest in Thrace, Scythia, Macedon, and Italy. This was the last remarkable action of Constantine. He died May 25, aged 66, 337, having divided the empire among his children and nephews, in the following manner. Constantine, his eldest son, had Gaul, Spain, and Britain; Constantius, the second, had Asia, Syria, and Egypt; and Constans, the youngest, Illyricum, Italy, and Africa. To his nephew Dalmatius, he gave Thrace, Macedon, and Achaia; and to king Annabalianus, his other nephew, Armenia Minor, Pontus, Cappadocia, and the city of Cæsarea, which he desired might be the capital of his kingdom.

CONSTANTINE, ROBERT, a learned physician born at Caen, taught polite literature in that city: and acquired great reputation by his skill in the Greek language, in history, and in medicine. He died in 1603, aged 103. He wrote a dictionary in Greek and Latin, and other works, which are esteemed.

CONSTANTINE, in geography, a kingdom of Africa, in Barbary, bounded on the N. by the Mediterranean, on the E. by the kingdom of Tunis, on the S. by Biledulgerid, and on the W. by the river Sufegmar, which separates it from the kingdom of Bugia. It is the new Numidia of the ancients, and had its own kings; but it is now a province of Algiers.

CONSTANTINOPLE, one of the largest and most celebrated cities in Europe, situated at the eastern extremity of Romania, and capital of the Ottoman empire. It is delightfully situated between the Black Sea and the Archipelago, and is now called Istambul by the Turks, and by the Greeks Stampoli. It is 700 miles S. E. of Vienna. Lon. 28. 59. E. from London, Lat. 41. 1. N. There are a great number of ancient monuments, of the original grandeur of Constantinople, still remaining. Among these may be mentioned the ancient Hippodrome, begun by Alexander Severus and finished by Constantine. The Turks call it *Atmeidan*. It has a pyramid of Theban marble inscribed with hieroglyphics. See **HIPPODROME**. There is also a colossus consisting of several square blocks of free-stone; a triangular pillar of cast brass representing three serpents entwined in each other, but the triple head is wanting; a column erected in honour of the emperor Arcadius, &c. but the superb temple of St. Sophia, now converted into a mosque, surpasses all the rest for grandeur and elegance. This city was enlarged and beautified by the emperor Constantine the Great, in 330. At the same time he transferred thither the seat of the empire; and this removal is generally thought to have been one of the principal causes of the sudden decline of the western empire. The number of inhabitants in this extensive city, has been variously estimated. Dr. Brookes and

Mr.

Mr. Walker state it at 800,000; of whom one-half are Turks; two-thirds of the other half Christians, and the rest Jews. Mr. Crutwell makes it 900,000; of whom 300,000 are Greeks, nearly 200,000 Armenians, and the rest Turks or other Europeans. But from the frequent depredations made by the plague, estimates of the population of this city made at different periods must necessarily vary.

CONSTANTINOPLE, THE STRAIT OF, anciently called Thracian Bosphorus, and forming the communication between the Euxine or Black Sea, and the Propontis, or sea of Marmora, is 20 miles long, and a mile and a quarter broad, where it is narrowest.

CONSTANTINOW, a town of Poland, in Volhynia, 96 miles S.E. of Lucko.

CONSTANTIUS I, surnamed **CHLORUS**, one of the few excellent emperors of Rome. He succeeded along with Galerius, A.D. 305, and died at York in 311, leaving a character completely amiable. To the military fame justly acquired in his victorious expeditions to Germany and Britain, he added the virtues of frugality, chastity, temperance, clemency, justice, and mercy. Though not a professed Christian himself, he would not suffer the Christians to be injured; and on his death-bed, he particularly recommended them to the protection of his son and successor, Constantine the Great.

CONSTAT, in law, a certificate which the clerk of the pipe and auditors of the exchequer make at the request of any person who intends to plead or move in that court for the discharge of any thing; and the effect of it is, the certifying what does *constare* upon record touching the matter in question. A *constat* is held to be superior to a certificate; because this may err or fail in its contents; that cannot, as certifying nothing but what is evident upon record. The exemplification under the great seal of the enrolment of any letters patent is also called *constat*.

CONSTELLATION, in astronomy, a system of several stars, near one another, but not in a cluster. Astronomers not only mark out the stars, but to bring them into order, they distinguish them by their situations and positions in respect to each other; and distribute them into constellations, allowing several stars to make up one constellation. For the better distinguishing of them, they reduce these constellations to the forms of animals, as men, bulls, bears, &c.; or to the images of some things known, as of a crown, a harp, a balance, &c.; or give them the names of those, whose memories they wish to transmit to future ages. The division of the stars by images and figures is of great antiquity, for in the book of Job, Orion, Arcturus, and the Pleiades, are mentioned; and we meet with the names of many constellations in the writings of Homer and Hesiod. The ancients, in their division of the firmament, took in only so much as came under their notice, distributing it into 48 constellations; but the modern astronomers comprehend the whole starry firmament, dividing it into three regions. See **ASTRONOMY**.

CONSTITUENT PART, in physiology, differs little from element and principle, which see.

CONSTITUTION, in a physical sense, is the particular temperament of the body, which depends chiefly on the state of its humours or fluids, and sometimes also on the solids, but especially the nerves. It is curious, says Dr. Percival, to observe the revolution that has taken place, within the last century, in the constitutions of the inhabitants of Europe. Inflammatory diseases occur less frequently; and in general are less rapid and violent in their effects, than they were formerly. This advantageous change, however, is more than counter-balanced by the introduction of debilitating articles of food and drink, several of which were utterly unknown to our ancestors, but now universally prevail. The bodies of men are enfeebled and enervated; and it is not uncommon to observe very high degrees of irritability, under the external appearance of great strength and robustness. The hypochondria, palsies, cachexies, dropsies, and all those diseases which arise from laxity and debility, are in our days often endemic; and the hysterics, which used to be peculiar to women, as the name itself indicates, now attack both sexes indiscriminately. It is evident that so great a revolution could not be effected without a concurrence of many causes; but amongst these (according to Dr. Percival), the general use of tea holds the first rank. The second may perhaps be allowed to excess in spirituous liquors. This pernicious custom, it is said, in many instances, owes its rise to the former, which, by the lowness and depression of spirits it occasions, ren-

ders it almost necessary to have recourse to something cordial and exhilarating. It is argued on the other hand, however, that tea tends to exhilarate instead of depressing the spirits; and that those of both sexes who are most addicted to excess in spirituous liquors, are almost always quite indifferent about tea.

CONSTITUTIONS, APOSTOLICAL, a collection of regulations attributed to the apostles, and supposed to have been collected by St. Clement, whose name they likewise bear. It is the general opinion, however, that they are spurious, and that St. Clement had no hand in them. They appeared first in the fourth century, but have been much changed and corrupted since. They are divided into eight books, consisting of a great number of rules and precepts, relating to the duties of Christians, and particularly the ceremonies and discipline of the church.

CONSTRUCTION, [*constructio*], in geometry, is the drawing of such lines, such a figure, &c. as are previously necessary for the making of any demonstration appear more plain and undeniable.

CONSTRUCTION OF EQUATIONS, in algebra, the method of drawing a geometrical figure, whose properties shall express the given equation, in order to demonstrate the truth of it geometrically. See **EQUATIONS, CONSTRUCTION OF**.

CONSTRUCTION, in grammar, the connecting of the words of a sentence according to the rules of the language. Construction is either simple or figurative, according as the parts of the discourse are placed in their natural order; or recede from that simplicity, when shorter and more elegant expressions are used than nature affords. The construction of words, called syntax, is distinguished into two parts, concord and regimen. See **GRAMMAR**.

CONSUALIA, in antiquity, feasts held in honour of the god Consus or Neptune; different from the Neptunalia. They were introduced with a magnificent cavalcade, because Neptune was reputed to have first taught men the use of horses. Evander is said to have first instituted this feast.

CONSUBSTANTIAL, [*ομοουσιος*], was a term first attempted by the fathers of the councils of Antioch and Nice, to express the orthodox doctrine the more precisely, and to serve as a barrier and precaution against the errors and subtleties of the Arians; who owned every thing except the consubstantiality. The Arians allowed that the Word was God, as having been made God; but they denied that he was the same God, and of the same substance with the Father: accordingly they exerted themselves to the utmost to abolish the use of the word. The emperor Constantine used all his authority with the bishops to have it expunged out of the symbols; but it was retained, and is still the distinguished criterion between an Athanasian and an Arian. Sandius insists, that the word consubstantial was unknown till the time of the council of Nice, but it is certain, it had been proposed to the council of Antioch and rejected.

CONSUBSTANTIATION. See **LUTHERANISM**.

CONSUEGRA, a town of Spain, in New Castile, belonging to the knights of Malta; 25 miles S.S.E. of Toledo.

CONSUL, [*consul*, *consulendo*, Lat.] the chief magistrate in the Roman republic. There were two magistrates invested with supreme authority for one year, and annually chosen in the Campus Martius. Brutus and Collatinus, the two first consuls, were elected A.U.C. 244. For 144 years afterwards the consuls were always chosen from Patrician families, but the people obtained the privilege of electing one of the consuls from their own body, A.U.C. 388, and sometimes both were plebeians. The first consul among the plebeians was L. Sextius. The *legitimum tempus*, the time fixed by law, for the consulship was 43 years of age. The candidate was always to appear at the election as a private man without a retinue, and it was requisite before he canvassed for the office to have discharged the functions of a *quaestor*, *edile*, and *praetor*. Sometimes these qualifications were disregarded.

CONSUL, at present, is an officer established by virtue of a commission from the king and other princes, in all foreign countries of any considerable trade, to facilitate and dispatch business, and protect the merchants of the nation. The consuls are to keep up a correspondence with the ministers of England residing in the courts whereon their consulate depends. They are to support the commerce and the interest of the nation; to dispose of the sums given, and the presents made to the lords and principals of places, to obtain their protection, and prevent the insults of the natives on the merchants of the nation. By the treaty of Utrecht between Great Britain and Spain, the consul residing in the king of Spain's dominions.

dominions shall take inventories of the estates of the English dying intestate in Spain; and these estates shall be intrusted with two or three merchants, for the security and benefit of the proprietors and creditors.

CONSULTATION, in law, a writ by which a cause being removed from the spiritual court to the king's court, is returned thither again; and the reason is, that if the judges of the king's court, by comparing the libel with the suggestion of the party, find the suggestion false or not proved, and on that account the cause to be wrongfully called from the ecclesiastical court, then upon this consultation or deliberation they decree it to be returned. This writ is in the nature of a *procedendo*; yet properly a consultation ought not to be granted, only in case where a person cannot recover at the common law. In causes of which the ecclesiastical and spiritual courts have jurisdiction, and they are not mixed with any temporal thing; if suggestion is made for a prohibition, a consultation shall be awarded.

CONSUMPTION, in medicine, is a very comprehensive term, including all those diseases, in which the body, from a defect of nourishment, is gradually reduced to a state of debility and emaciation. This fatal disorder may arise from a great variety of causes, such as a mal-conformation of the trunk; straitness of the chest; intemperance of whatever kind; obstructions in the pulmonary vessels; suppression of any natural evacuations; as likewise in consequence of pleurisy, coughs, catarrhs, diarrheas, grief, intense study, &c. More frequently, however, it originates from a neglected cold, especially in constitutions where a peculiar hereditary disposition prevails, without any other discoverable cause. See **MEDICINE**.

CONSUS, a name of Neptune, the pagan god of counsel. He had an altar under ground in the great circus at Rome, to shew that counsel ought to be kept secret.

CONTA, a river of Italy, in Liguria, which runs into the sea near Albenga.

CONTABULATE, *v. a.* [*contabulo*, Lat.] to floor with boards.

CONTABULATION, [*contabulatio*, Lat.] a joining of boards together.

CONTACT, [*contactus*, Lat.] is when one line, plane, or body, is made to touch another, and the parts that do thus touch, are called the points or places of contact. The contact of two spheres, and of a tangent with the circumference of a circle, is only in one point.

CONTAGION, [*contagio*, Lat.] infection, or the communication of a disease from one body to another. In some cases it is conveyed by immediate contact or touch; in others, by infected clothes, such as cotton, and particularly wool, which of all substances is the most susceptible, because it is extremely porous. Contagious matter is also, though we apprehend erroneously, said to be transmitted through the air, at a considerable distance, by means of effluvia arising from the sick, in which case the atmosphere is said to be infected. Some authors have asserted, that the gout and consumption are likewise contagious; but this appears to be very doubtful. It is, however, highly probable, that those diseases may be communicated by the milk of nurses. In temperate climates, like that of Britain, there is but little danger of contracting them by infection, among adults; though, in the warmer climates of Europe, it will be prudent to take the necessary precautions against such accidents. To obviate as far as possible all infection, we would recommend to those who are obliged to attend patients, never to approach them fasting; and, while they are in their apartment, to avoid both eating and drinking, and also the swallowing of their own saliva. Nor will it be altogether useless to chew myrrh, cinnamon, and similar drugs, which promote a plentiful discharge from the mouth. As soon as a person has returned from visiting an infected patient, he ought immediately to wash his mouth and hands with vinegar; to change his clothes, carefully exposing those he has worn to the fresh air; and then to drink a warm infusion of sage, or other aromatic herbs, which tends to open the pores, and expel, by means of a gentle perspiration, the pestilential virus, if any should have incorporated with the mass of his fluids. It will also be of considerable service to those who are employed about sick persons, frequently to smell vinegar and camphor, or to fumigate the apartments with tobacco, the pungency of which accelerates the circulation of the blood,

and is believed to prevent infection, by attracting the contagious effluvia.

CONTAGION, a disorder peculiar to cattle, more commonly called distemper, to which we refer.

CONTAY, a town of France, in the department of Somme, 10½ miles N.E. of Amiens.

CONTCHOUDESONG, a town of Asia, in Thibet, 380 miles E.N.E. of Lassa.

CONTEMPLATION, an act of the mind, whereby it applies itself to consider and reflect upon the works of God, nature, &c.

CONTEMPT, in law, is a disobedience to the rules and orders of a court, which hath power to punish such offence; and as this is sometimes a greater, and sometimes a less offence, so it is punished with a greater or less punishment, by fine or imprisonment.

CONTENT, in geometry, the area or quantity of matter or space included in certain bounds. The content of a tun of round timber is 43 solid feet. A load of hewn timber contains 50 cubic feet: in a foot of timber are contained 1728 cubic or solid inches; and as often as 1728 inches are contained in a piece of timber, be it round or square, so many feet of timber are contained in the piece. See **MENSURATION**.

CONTENTIOUS JURISDICTION, in law a court which has a power to judge and determine differences between contending parties. The lord chief justices, and judges, have a contentious jurisdiction; but the lords of the treasury, and the commissioners of the customs, have none, being merely judges of accounts and transactions.

CONTERMINOUS. Repetends, or circulates, containing an equal number of circulating places, are so called.

CONTEXT, among divines and critics, that part of scripture or of a writing that precedes and follows the text. See **TEXT**. In order to have the full sense of the text, the context should be regarded.

CONTI, a town of France, in the department of Somme, 62 miles N. of Paris.

CONTIGUITY, in geometry, is when the surface of one body touches that of another.

CONTIGUOUS ANGLES, in geometry, are such as have one leg common to each angle, and are sometimes called adjoining angles, in contradistinction to those produced by continuing their legs through the point of contact, which are called opposite or vertical angles. See **ANGLE**. The sum of any two contiguous angles is always equal to two right angles.

CONTINENCE, in ethics, is that moral virtue, by which we resist concupiscence. There is this distinction between chastity and continence in that it requires no effort to be chaste, which results from constitution; whereas continence appears to be the consequence of a victory gained over ourselves. The original verb, *continere*, signifies to restrain. The term, however is most usually applied to men; as chastity is to women. See **CHASTITY**. Continence is a virtue too little regarded in modern times. But however fashionable certain vices may be, solid virtue will always keep its place in the opinion of the wise and sensible part of mankind.

CONTINENT, [*continens*, Lat.] in geography, a great extent of land not interrupted by seas, in contradistinction to island, peninsula, &c. See **GEOGRAPHY**. The world is usually divided into two great continents, the old and the new. Whether there exists in the southern hemisphere another continent, or the whole be only an immense watery region, was a question that for near three centuries engaged the attention of the learned as well as the commercial world, and gave rise to many interesting voyages and discoveries.

CONTINGENT, [*contingens*, Lat.] falling out by chance; accidental; not determinable by any certain rule. Hence future contingent, in logic, denotes a conditional event which may or may not happen, according as circumstances fall out.

CONTINGENT is also a term of relation for the quota that falls to any person upon a division. Thus each prince in Germany, in time of war was formerly obliged to furnish so many men, and so much money and ammunition for his contingent.

CONTINGENT USE, in law, is an use limited in a conveyance of lands which may or may not happen to vest, according to the contingency mentioned in the limitation of the use. And a con-

tangent remainder is when an estate is limited to take place at a time to come, on an uncertain event.

CONTINGENT LINE in dialling, the same with the tangent line. It is supposed to arise from the intersection of the plane of the dial and the equinoctial; and is so called because it is a tangent to a circle, drawn upon the plane of the dial, and is at right angles with the substilar line. See **DIALLING**.

CONTINUAL, [*continuus*, Lat.] in law, a continual claim is made from time to time, within every year and a day, to land or other thing, which, in some respect, we cannot attain without danger. For example, if I be disseised of land into which, though I have right into it, I dare not enter, for fear of beating; it becometh me to hold on my right of entry to the best opportunity of me and mine heir, by approaching as near it as I can, once every year as long as I live; and so I save the right of entry to my heir.

CONTINUAL PROPORTIONALS, in arithmetic, are such numbers, wherein the consequent of the first ratio is the same with the antecedent of the second, as 4 : 8 :: 8 : 16. And, on the contrary, if the consequent of the first ratio be different from the antecedent of the second, the proportion is said to be discrete, as 3 : 6 :: 4 : 8.

CONTINUANCE OF A WRIT OR ACTION, is its continuing in force from one term to another, where the sheriff has not returned a former writ issued out in the same action. With respect to continuances, the court of king's bench is not to enter them on the roll till after issue or demurrer, and then they enter the continuance of all on the back, before judgement.

CONTINUED BASS, in music, thus called, says, Rousseau, because it is continued through the whole piece. Its principal use, besides that of regulating the harmony, is to support the voice and preserve the tone. They pretend that it was one Ludovico Viana, of whom a treatise still remains, who, towards the end of the last century first put the continued bass in practice.

CONTINUED FEVER, is such a one as sometimes remits, but never intermits or goes entirely off, till its period.

CONTINUED PROPORTION, in arithmetic, is that where the terms or quantities compared are continual proportionals; that is, where the consequent of the first ratio is the same with the antecedent of the second. See **CONTINUAL PROPORTIONALS**.

CONTINUITY is defined by some schoolmen the immediate cohesion of parts in the same quantum; by others, a mode of body, whereby its extremities become one; and by others, a state of body resulting from the mutual implication of its parts. There are two kinds of continuity, mathematical and physical. The first is merely imaginary, since it supposes real or physical parts where there are none. The other or physical continuity, is that state of two or more particles, in which their parts are so mutually implicated as to constitute one uninterrupted quantity.

CONTINUO, in music, or Basso continuo, is the continual or thorough bass, which is sometimes marked in music books by the letters B.C.

CONTOBADDITES, a sect which appeared in the 6th century. Their first leader was Severus of Antioch; who was succeeded by John the grammarian, surnamed Philoponus, and one Theodosius whose followers were also called Theodosians.

CONTORSION, in medicine, signifies, 1. The iliac passion: 2. An incomplete dislocation, when a bone is in part, but not entirely, forced from its articulation: 3. A dislocation of the vertebræ of the back side-ways, or a crookedness of these vertebræ: an 4. A disorder of the head, in which it is drawn towards one side, either by a spasmodic contraction of the muscles on the same side, or a palsy of the antagonist muscles on the other.

CONTOUR, in architecture, is the outline of any member, as that of a base, cornice, &c.

CONTOUR, among the Italian painters signifies the lineaments of the face.

CONTOURNE, in heraldry, is used when a beast is represented standing or running with its face to the sinister side of the escutcheon, they being always supposed to look to the right, if not otherwise expressed.

CONTOURNIATED, a term among antiquaries applied to medals, the edges of which appear as if turned in a lath.

CONTRABAND, [*contrabando*, Ital. contrary to proclamation,] prohibited; illegal; unlawful.

CONTRABAND, in commerce, a prohibited commodity, or mer-

chandise bought or sold, imported or exported, in prejudice to the laws and ordinances of a state, or the public prohibitions of the sovereign. Contraband goods are not only liable to confiscation themselves, but also subject all other allowed merchandise found with them in the same box, bale, or parcel, together with the horses, waggons, &c. which conduct them. There are contrabands likewise, which, besides the forfeiture of the goods, are attended with several penalties and disabilities. In this country, there are two principal contrabands for exportation, wools and live sheep, which all strangers are prohibited from carrying out of the country; the other that of sheep-skins and calf-skins.

CONTRACT, in a general sense, a mutual consent of two or more parties, who voluntarily promise and oblige themselves to do something, pay a certain sum, or the like. All donations, exchanges, leases, &c. are so many different contracts.

CONTRACT, in common law, an agreement or bargain between two or more persons with a legal consideration or cause; as where a person sells goods, &c. to another for a sum of money; or covenants in consideration of a certain sum, or an annual rent, to grant a lease of a messuage, &c. Contracts are two-fold, either express or implied. Express contracts are where the terms of the agreement are openly uttered, as to pay a stated price for certain goods. Implied are such as reason and justice dictate, and which, therefore, the law presumes that every man undertakes to perform: thus, if a man take up wares from a tradesman, without any agreement of price, the law concludes that he contracted to pay their real value.

CONTRACT, **USURIOUS**, is an agreement to pay more interest for money than the laws allow.

CONTRACTILE FORCE, [from *con*, together, and *traho*, to draw, Lat.] that property or power inherent in certain bodies, whereby, when extended, they are enabled to draw themselves up to their former dimensions.

CONTRACTION, [*contractio*, Lat.] in physics, the diminishing of the extent or dimensions of a body, or the causing of its parts to approach nearer to each other, in which sense it stands opposed to dilatation or expansion. See **EXPANSION**. Water and all aqueous fluids are gradually contracted by a diminution of temperature, until they arrive at a certain point, which is about 8° above the freezing point; but below that point they begin to expand, according as the temperature is lowered. Similar effects have been observed with regard to some metals. Glass and some metals are rendered very hard and brittle by being suddenly cooled. The cause of this effect is thus explained by Dr. Young. "When glass in fusion is very suddenly cooled, its external parts become solid first, and determine the magnitude of the whole piece, while it still remains fluid within. The internal part, as it cools, is disposed to contract still further, but its contraction is prevented by the resistance of the external parts, which form an arch or vault round it, so that the whole is left in a state of constraint; and as soon as the equilibrium is disturbed in any one part, the whole aggregate is destroyed. Hence it becomes necessary to anneal all glass, by placing it in an oven, where it is left to cool slowly; for, without this precaution a very slight cause would destroy it."

CONTRADICTION, a sort of direct opposition, wherein one thing is found directly contrary to another. It is usually defined in the schools, *oppositio inter ens & non ens*, *medio carens*; where by *ens & non-ens*, are meant any two extremes, one whereof affirms and the other denies; and it is said to be *medio carens*, in order the better to distinguish it from other species of oppositions: for the extremes here neither agree in subject, as is the case in form and privation, nor in essence and kind, as in contrariety. See **CONTRARIETY**, and **PRIVATION**.

CONTRADICTION, in a legal sense, a person that has a title to contradict or gainsay. An inventory of the goods of a minor should be made in presence of his guardian, or trustee, he being the legal contradictor. A decree against a farmer has no effect on the landlord, the first not being the legitimate contradictor.

CONTRADICTORY PROPOSITIONS, in logic, are such as differ both in quality and quantity, one being universal and the other particular, which constitutes the opposition of quantity; one affirmative and the other negative, which makes the opposition in quality: thus, A. Every vine is a tree. O. Some vine is not a tree.

CONTRADICTORY,

CONTRADICTORY, SEEMING, is when the members of a period quite disagree in appearance and sound, but perfectly agree and are consistent in sense; thus,

Cowards die many times before their death:

The valiant never taste of death but once.

CONTRA-HARMONICAL PROPORTION, in arithmetic, is that relation of three terms, wherein the difference of the first and second is to the difference of the second and third as the third is to the first: thus, 3, 5, and 6, are numbers contra-harmonically proportional, for 2 : 1 :: 6 : 3.

CONTRAMURE, in fortification, is a wall built before another partition-wall, to strengthen it, so that it may receive no damage from the adjacent buildings.

CONTRARIETY, [from *contrarietas*, Lat.] an opposition between two things, which imports their being contrary to one another; and consists in this, that one of the terms implies a negation of the other, either mediately, or immediately; so that contrariety may be said to be the contrast, or opposition, of two things, one of which imports the absence of the other, as love and hatred.

CONTRAST, [*contrasté*, Fr.] opposition and dissimilitude of figures, by which one contributes to the visibility or effect of another.

CONTRAST, in architecture, is the avoiding of the representation of the same thing, in order to please by variety.

CONTRAST, in painting and sculpture, expresses a difference of position, attitude, &c. of two or more figures; as where, in a groupe of three figures, one is shewn before, another behind, and another sideways, they are said to be in contrast. The contrast is not only to be observed in the position of several figures, but also in that of several members of the same figure: thus, if the right arm advance farthest, the right leg is to be hindmost; if the eye be directed one way, the arm to go the contrary way, &c. The contrast must be pursued even in the drapery.

CONTRATE-WHEEL, in watch-work, that next to the crown, the teeth and hoop of which lie contrary to those of the other wheels, whence it takes its name.

CONTRAVALLATION, [from *contra* and *vallo*, Lat.] the fortification thrown up by the besiegers, round a city, to hinder the sallies of the garrison.

CONTRAVALLATION, LINE OF. See **FORTIFICATION.**

CONTRAVENTION, in law, a man's failing to discharge his word, obligation, duty, or the laws or customs of the place.

CONTRE, in heraldry, an appellation given to several bearings, on account of their cutting the shield contrary and opposite ways: thus we meet with contre-bend, contre-chevron, contre-pale, &c. when there are two ordinaries of the same nature opposite to each other, so as colour may be opposed to metal, and metal to colour.

CONTRES, a town of France, in the department of Loir and Cher, district of St. Aignan, and late province of Blaisois, 10 miles S. of Blois.

CONTRIBUTION, in a general sense, the payment of each person's quota, or the share he bears in some imposition or common expence. Contributions are either voluntary, as those of expences for carrying on some undertaking for the public interest; or involuntary, as those of taxes and imposts.

CONTRIBUTION, in a military sense, an imposition or tax paid by frontier-countries to an enemy, to prevent their being plundered and ruined by him.

CONTRIBUTIOE FACIENDA, in law, a writ that lies where tenants in common are bound to do the same thing, and one or more of them refuse to contribute their part; as where they jointly hold a mill, pro indiviso, and equally share the profits thereof, if the mill falls to decay, and one or more of the persons refuse to contribute to its reparation, the rest shall have this writ to compel them.

CONTRITION, in theology, a sorrow for our sins, resulting from the reflexion of having offended God, from the sole consideration of his goodness, without any regard to the punishment due to the trespass, and attended with a sincere resolution of reforming them. The scripture never uses this term in this sense; but there are several passages which prove, that, without contrition, there is no repentance, and without repentance no remission of sins.

CONTROL, [*controlo*, that is, *contre role*, Fr.] a register or account kept by another officer, that each may be examined by the other.

CONTROLLER, an officer appointed to control or oversee the accounts of other officers; and, on occasion, to certify whether things have been controlled or examined. In Britain we have several officers under this title; as controller of the navy, the customs, the mint, &c. besides the following:

CONTROLLER OF THE HANAPER, an officer who attends the lord chancellor daily, in term and in seal time, to take all things sealed in leathern bags from the clerks of the hanaper, and to make the number and effect thereof, and enter them in a book, with all the duties belonging to the king and other officers for the same, and so charge the clerk of the hanaper with them.

CONTROLLER OF THE HOUSEHOLD, the second officer under the lord steward. His office is to control the accounts and reckonings of the Green Cloth, of which board he is always a member. He carries a white staff, and is always one of the privy council.

CONTROLLER OF THE PELLs, two officers of the exchequer, who are the chamberlain's clerks, and keep a control of the pell of receipts, and goings out.

CONTROLLER OF THE PIPE, an officer of the exchequer, that makes out a summons twice every year, to levy the farms and debts of the pipe. See **PIPE**, and **EXCHEQUER**.

CONTUMACY, [*contumacia*, Lat.] obstinacy; perverse-ness; stubbornness; inflexibility.

CONTUMACY, in law, a wilful contempt and disobedience to any lawful summons or judicial order.

CONTUSION, in medicine and surgery, any hurt of the body that is inflicted by a blunt instrument. See **MEDICINE**, and **SURGERY**.

CONVALESCENCE, or **CONVALESCENCY**, [from *convalesco*, Lat.] signifies the insensible recovery of health; or that state in which, after the cure of a disorder, the body, which has been reduced, has not yet regained its vigour, but begins to resume its power. Proper aliments conduce to the re-establishment of the languid faculties; but as the tone of the bowels is weakened, the digestive faculty is not equal to its office, which is shewn by light sweats over the whole body; and the smallest excess in this respect is oftentimes the occasion of dangerous relapses. A person in this state is like a taper relumined, which the least degree of wind is sufficient to extinguish.

CONVALLARIA, THE LILY OF THE VALLEY, in botany, a genus of the monogynia order, and hexandria class of plants; natural order, Sarmientaceæ. Corolla sexfid; berry spotted, trilocular. There are eleven species.

CONVENE, an ancient people of Gallia Narbonensis, said by Pliny to have been originally robbers and slaves, whom Pompey compelled to settle at the foot of the Pyrenees, after the Sertorian war.

CONVENER, the title given to the præses of the 14 deacons of the Incorporations, or Trades of Edinburgh, from his power of convening the deacons, or the whole incorporations, upon any emergency.

CONVENT. See **MONASTERY**, and **MONK**.

CONVENTICLE, is a diminutive of convent; denoting, properly, a secret assembly of a part of the monks of a convent, to make a party in the election of an abbot. Hence the word is come into disrepute, and stands for any seditious, or irregular assembly. The word was first attributed as an appellation of reproach to the religious assemblies of Wickliffe, in this nation, in the reigns of Edward III. and Richard II. and is now applied to illegal meetings of non-conformists. There were several statutes made in former reigns, for the suppression of conventicles. But the 1st W. and M. cap. 18. ordains, that protestant dissenters shall be exempted from penalties: though if they meet in a house with the doors locked, barred, or bolted, such dissenters shall have no benefit from 1 W. and M. Officers of the government, &c. present at any conventicle, at which there shall be ten persons, if the royal family be not prayed for in express words, shall forfeit 40*l*. and be disabled. 10 Anne, cap. 2.

CONVENTION, a treaty, contract, or agreement between two or more parties. Every convention among men, provided it be not contrary to honesty and good manners, produces a natural obligation, and makes the performance a point of conscience. Every convention has either a name and a cause of consideration, or it has none; in the first case it obliges civilly and naturally, in the latter only naturally.

CONVENTION, is also a name given to an extraordinary assembly

bly of parliament, or the states of the realm, held without the king's writ; as was the convention of estates, who, upon the retreat of James II. came to a conclusion that he had abdicated the throne, and that the right of succession devolved to King William and Queen Mary; whereupon their assembly expired as a convention, and was converted into a parliament.

CONVENTUS JURIDICI, in Roman antiquity, courts of justice established in the provinces; with jurisdictions circumscribed within certain limits, whither all who were of the resort were to repair for justice.

CONVERGE, [*convergo*, Lat.] to tend to one point from different places.

CONVERGING, or **CONVERGENT LINES**, in geometry, are such as continually approach nearer one another; or whose distance becomes still less and less. These are opposed to divergent lines, the distance of which become continually greater: those lines which converge one way diverge the other.

CONVERGING HYPERBOLA, is one whose concave legs bend in towards one another, and run both the same way.

CONVERGING RAYS, in optics, those rays that, issuing from divers points of an object, incline towards one another, till, at last, they meet and cross, and then become diverging rays. See **OPTICS**.

CONVERGING SERIES. See **SERIES**.

CONVERSATION, or **DISCOURSE**, an interlocution between two, or among several persons. There is no part, perhaps, of social life which affords more real satisfaction than those hours which one passes in rational and unreserved conversation. To render conversation at all times agreeable, the following rules have been laid down: 1. The parties should meet together with a determined resolution to please, and to be pleased. 2. No one should be eager to interrupt others, or be uneasy at being interrupted. 3. All should have leave to speak in turn. 4. Inattention should be carefully avoided. 5. Private concerns should never be mentioned, unless particularly inquired into, and even then as briefly as possible. 6. Each person should, as far as propriety will admit, be afforded an opportunity of discoursing on the subject with which he is best acquainted. He will be pleased, and the company will be informed. By observing this rule, every one has it in his power to assist in rendering conversation agreeable; since, though he may not choose, or be qualified, to say much himself, he can propose questions to those who are able to answer them. 7. Stories should be avoided, unless short, pointed, and quite a-propos. He who deals in them, says Swift, must either have a very large stock, or a good memory, or must often change his company. 8. Each person should speak often, but not long. Haranguing in private company is insupportable. 9. If the majority of the company be naturally silent, or reserved, the conversation will flag, unless it be often renewed by one who can start new subjects. 10. It is improper to laugh at one's own wit and humour. This should be left to the company. 11. When the conversation is flowing in a serious and useful channel, never interrupt it by an ill-timed jest. 12. It is at all times extremely indelicate to whisper to one's next neighbour. It is, in some degree, a fraud, conversation being a kind of common property. 13. In speaking of absent people, the infallible rule is, to say no more than we should say, if they were present. "I resolve (said Bishop Beveridge) never to speak of a man's virtues to his face, nor of his faults behind his back." A golden rule; the observation of which would at once banish flattery and defamation from the world.

CONVERSE, in mathematics. One proposition is called the converse of another, when, after a conclusion is drawn from something supposed in the converse proposition, that conclusion is supposed; and then, that which in the other was supposed, is now drawn as a conclusion from it: thus, when two sides of a triangle are equal, the angles opposite to these sides are equal; and, on the converse, if these angles are equal, the two sides are equal.

CONVERSERA, an island in the Adriatic sea, on the coast of Istria.

CONVERSI, a title formerly given to Jews, who were converted to Christianity in England.

CONVERSION, [*conversio*, Lat.] change from one state to another; transmutation.

CONVERSION, in a moral sense, implies a repentance for a tem-

per and conduct unworthy our nature, and unbecoming our obligations to its author, and a resolution to act a wiser and a better part for the future.

CONVERSION, in a scripture sense is the turning, or total change, of a sinner from sin unto God. Psal. 51. 13. "And sinners shall be converted unto thee." It is equivalent to the new birth, and therefore essential to salvation.

CONVERSION, in rhetoric, &c. is understood of arguments which are returned, retorted, and shewn on opposite sides, by changing the subject into the attribute, and the attribute into the subject. See **ATTRIBUTE**, &c.

CONVERSION, in war, a military motion whereby the front of a battalion is turned where the flank was, in case the battalion is attacked in the flank. As this may often be the case in action, this motion is accounted a most useful and necessary one.

CONVERSION OF EQUATIONS, in algebra, is when the quantity sought, or any part or degree thereof, being in fractions, the whole is reduced to one common denomination, and then omitting the denominators, the equation is continued in the numerators only.

Thus suppose $a - b = \frac{aa + cc}{d} + h + b$; multiply all by d , and it will stand thus, $da - db = aa + cc + dh + db$. See **ALGEBRA**.

CONVERSION OF PROPOSITIONS, in logic, the changing of the subject into the place of the predicate, and the predicate into the place of the subject; and yet always retaining the same quality of both propositions: as, every right-lined triangle has the sum of its angles equal to two right ones: every right-lined figure, that has the sum of its angles equal to two right ones, is a triangle. Conversion is usually defined a due change of the order of the extremes: *i. e.* under such a habitude and coherence, with respect to each other, that the one is rightly inferred from the other.

CONVERT, a person who has undergone conversion. See **CONVERSION**. Convert is frequently used in respect of changes from one religion, or religious sect, to another. These, with regard to the religion they have relinquished, are denominated apostates, and converts only with relation to the religion turned to.

CONVERT, in a monastic sense, a lay friar, or brother, admitted for the service of the house; without orders, and not allowed to sing in the choir. The word was anciently used for persons who embraced the monkish life at the age of discretion.

CONVEX, [*convexus*, Lat.] an appellation given to the exterior surface of gibbous or globular bodies, in opposition to the hollow inner surface of such bodies, which is called concave: thus we say, a convex frieze, lens, mirror, superficies, &c.

CONVEX LENS, or **CONVEX MIRROR**. See **CONVEXITY**, and **OPTICS**.

CONVEXITY, in catoptrics and dioptrics; is applied to mirrors and lenses. A convex mirror represents its images smaller than the objects; as a concave one represents them larger: a convex mirror reflects the rays from it, diverging; and therefore disperses and weakens their effect: as a concave one reflects them converging, so as they concur in a point, and have their effect increased: and by how much the mirror is a portion of a smaller sphere, by so much does it diminish the objects, and disperse the rays the more. A convex lens is either convex on both sides, called a *convexo-convex*; or it is plain on one side and convex on the other, called a *plano-convex*; or concave on one side, and convex on the other, called a *convexo-concave*, or *concavo-convex*, as the one or the other surface prevails, *i. e.* as this or that is a portion of a smaller sphere. See **OPTICS**.

CONVEYANCE, in law, a deed which passes land from one to another. The most common conveyances now in use are, deeds of gift, bargain and sale, lease and release, fines and recoveries, settlements to uses, &c. A conveyance cannot be fraudulent in part, and good as to the rest; for if it be fraudulent and void in part, it is void in all, and it cannot be divided. Fraudulent conveyances to deceive creditors, defraud purchasers, &c. are void, by stat. 50 Ed. III. c. 6. 13 Eliz. c. 5. 27 Eliz. c. 4.

CONVICT, in common law, a person that is found guilty of an offence by the verdict of a jury. The law implies that there must be a conviction before punishment for any offence, though it be not mentioned in any statute. On a joint indictment, or information, some of the defendants may be convicted and others acquitted.

CONVIET

CONVICT RECUSANT, a person who has been legally presented, indicted, and convicted, for refusing to come to church to hear the common prayer, according to the statutes 1 and 23 Eliz. and 3 Jac. 1.

CONVICTION, in theology, expresses the first degree of repentance, wherein the sinner becomes sensible of his guilt, of the evil nature of sin, and of the danger of his ways.

CONVOCATION, an assembly of the clergy of England, by their representatives, to consult of ecclesiastical matters. It is held during the session of parliament, and consists of an upper and a lower house. In the upper sit the bishops, and in the lower the inferior clergy, who are represented by their proctors, consisting of all the deans and archdeacons, of one proctor for every chapter, and two for the clergy of every diocese, in all one hundred and forty-three divines, viz. twenty-two deans, fifty-three archdeacons, twenty-four prebendaries, and forty-four proctors of the diocesan clergy. The lower house chooses its prolocutor, whose business it is to take care that the members attend, to collect their debates and votes, and to carry their resolutions to the upper house. The convocation is summoned by the king's writ, directed to the archbishop of each province, requiring him to summon all bishops, deans, archdeacons, &c. The power of the convocation is limited by a statute of Henry VIII. They are not to make any canons or ecclesiastical laws without the king's licence; nor when permitted to make any, can they put them in execution but under several restrictions. They have the examining and censuring of all heretical and schismatical books and persons, &c. but there lies an appeal to the king in chancery, or to his delegates. The clergy in convocation, and their servants, have the same privileges as members of parliament. See PARLIAMENT.

CONVOLVULUS, BIND-WEED: a genus of the pentandria order, and monogynia class of plants: natural order, Campanaceæ. Corolla campanulated, plaited; stigmata two; capsule two-celled, having two seeds in each cell. There are 110 species of this very numerous genus, not more than thirteen species are natives of Europe; the others are mostly inhabitants of the warmer climates of Asia and America. Very few of them are cultivated in our gardens, except *C. purpureus*, purple bindweed; and *C. tricolor*, trailing bindweed, more commonly known by the names of convolvulus, major, and minor; the stems are herbaceous and milky, in the greater part twining; in a very few shrubby; leaves alternate; peduncles axillary or terminating, one-flowered, with two bracts. The jalappa, or jalap, used in medicine, is a native of the city of Aleppo in Spanish America, situated between La Vera Cruz, and Mexico. It has a large root of an oval form, full of a milky juice; from which come out many herbaceous twining stalks, rising eight or ten feet high, with variable leaves; some of them being heart-shaped, others angular, and some oblong and pointed. They are smooth, and stand upon long footstalks; the flowers are shaped like those of the common greater bindweed, each footstalk supporting only one flower. See Plate XXXV.

CONVOY, in marine affairs, one or more ships of war, employed to accompany and protect merchant ships, and prevent their being insulted by pirates, or the enemies of the state in time of war.

CONVOY, in military matters, a body of men that guard any supply of men, money, ammunition, or provisions, conveyed by land into a town, army, or the like, in time of war.

CONUS, in natural history, a genus of vermes testacea: animal a linax; shell univalve, convolute, turbinate; aperture effuse, longitudinal, linear without teeth, entire at the base; pillar smooth. This genus is divided into five distinct families, viz. A. spire or turban nearly truncate. B. pyriform with a rounded base; the cylinder half as long again as the spire. C. elongated, and rounded at the base; the cylinder as long again as the spire. D. ventricose in the middle, and contracted at each end. E. thin, ventricose, and making a tinkling sound when thrown on its back upon a table or board. There are upwards of 70 species. Many of the conus tribe are beautiful shells, and bear a high price on account of their rarity. We have no species of this genus upon the English coast. Some very curious kinds have been discovered in a fossil state in England, chiefly in the chalk cliffs of Hampshire. See Plate V.

CONVULSION, a disease attended with an irregular and unnatural contraction of the muscles without sleep. The causes

depend on a certain irritability of the nervous system.—Delicate hysteric women, and men disposed to hypochondriasis, are equally subject to this disorder. Frequently, however, convulsive symptoms take place in consequence of wounds, irritations of the stomach and intestines, worms, poisons, violent cathartics, emetics, &c. When infants are attacked with convulsions which threaten their lives, the safest expedient will be to immerse them into tepid or milk-warm water, and keep them in that situation, by adding gradually a little hot water, so as to preserve an equal temperature of 96 or 98 degrees, till medical assistance can be procured. Although we are not inclined to give implicit credit to anonymous authorities, yet we think the following particulars worthy of insertion. A correspondent in the 22d volume of the Gentleman's Magazine, justly observes, that convulsions in children, before dentition, generally proceed from acrid, irritating humors produced in the first passages, by living chiefly on accescent food; such fits being preceded by gripings, green-stools, &c. He therefore directs one ounce of white sugar-candy to be reduced to fine powder, and 120 drops, or two drams, of the best oil of aniseed, to be dropped upon it: these should be rubbed together in a mortar, then mixed with an ounce of spermaceti, in powder. The dose is twenty grains, to be given in a little milk drawn from the breast, and to be repeated every three or four hours, or oftener, if the uneasiness of the child should require it. See MEDICINE.

CONWAY, a market-town of N. Wales, in Caernarvonshire, called also Aberconway, situated 15 miles west of St. Asaph.

CONWAY, a river of N. Wales, which rises from a lake where the counties of Caernarvon, Denbigh, and Merioneth, meet; and falls into the Irish sea at Conway.

CONWAY, a township of the United States, in Stafford county, New Hampshire.

CONWAY, a township in Hampshire county, Massachusetts.

CONY. See LEPUS, and CAVIA.

CONYZA, FLEABANE: a genus of the polygamia superflua order, and syngenesia class of plants; natural order, Compositæ. Pappus simple; calyx imbricated, roundish, the corollula of the radius trifid. There are 43 species, herbaceous or shrubby plants with compound flowers.

CONZA, a town of Naples, on the river Offanto, 52 miles S. E. of Naples.

COOK, SIR ANTHONY, a descendant of Sir Thomas Cook, lord mayor of London, was born in 1506. He was so eminent for his learning, piety, and prudence, that the guardians of king Edward VI. appointed him his chief instructor. He had four daughters; and being resolved to have sons by education, lest he should have none by birth, he taught his daughters those lessons by night that he had instilled into the prince by day: he was happy in his endeavours, as they proved learned in Greek and Latin, and equally distinguished by virtue, piety, and good fortune. Mildred was married to the great lord Burleigh; Ann to Sir Nicholas Bacon, lord keeper of the great seal; Elizabeth to Sir John Russell, son and heir of Francis earl of Bedford; and Catherine to Sir Henry Killigrew. He lived in exile during the persecution under Q. Mary, and returning on the accession of Q. Elizabeth, spent the rest of his days in peace and honour, till he died, in 1576.

Cook, Captain JAMES, one of the most celebrated navigators that ever appeared, was the son of James Cook, a servant in husbandry. Captain Cook was born, at Marton in Yorkshire, Oct. 27, 1728. He was one of nine children, and was put to a day-school, by Mr. Skottow, his father's employer, where he was instructed in writing and the first rules in arithmetic. Before the age of 13, he was bound apprentice to a shopkeeper at Straiths, 10 miles from Whitby: but some disagreement occurring, he bound himself apprentice to Messrs. Walkers of Whitby, who had several vessels in the coal trade; and after serving a few years as a common sailor, he was raised to be mate of one of Mr. Walker's ships. On the breaking out of the war in 1755 he entered on board the Eagle man of war, and distinguishing himself by his sobriety and diligence, obtained, in 1759, a warrant as master. He served in that capacity at the reduction of Quebec, and while on that station was employed in taking the soundings of the river St. Lawrence; afterwards he was engaged in making a chart of the same river, which he executed with great accuracy. He was next with lord Colvil, in the Northumberland, at the retaking

of Newfoundland, of which coast he made a survey. On his return to England in 1762 he married a respectable young woman at Barking, in Essex, for whom he had always the tenderest regard. The year following he accompanied captain Graves, governor of Newfoundland, where he made many curious researches, and observed a solar eclipse, an account of which he transmitted to the Royal Society. It being resolved to send out persons to Otaheite, in the South sea, for the purpose of observing the transit of Venus, in 1769, Mr. Cook was selected for the command, and raised to the rank of lieutenant. In August 1768, he sailed in the Endeavour, accompanied by Mr. Green, as astronomer, Mr. now Sir Joseph Banks, and Doctor Solander. The transit was accurately observed, and July 13th our navigator left Otaheite on a voyage of discovery, in which he discovered a number of islands, to which he gave the name of Society islands. October 6th he anchored at New Zealand, which he circumnavigated. From thence he sailed to New Holland, his account of which occasioned a settlement there, named by him Botany Bay, and which colony will, in all probability, be attended with vast effects in those regions. He arrived, after many dangers, June 12, 1771, and in August following was appointed a commander in the navy. An account of this voyage was published from the captain's journals and those of Mr. Banks by Dr. Hawkesworth. The existence of a southern continent being still an undecided question, captain Cook was employed in another voyage to ascertain the point, and he accordingly sailed with two ships, the Resolution, commanded by himself, and the Adventure, by captain Furneaux, July 13, 1772. In this voyage they explored the southern hemisphere as high as latitude $71^{\circ} 10'$, amidst immense fields and mountains of ice, where a ship had never been; but in the course of it the two vessels parted, and never joined each other again. Captain Cook, after refreshing at Otaheite, sailed to the westward, and discovered a groupe, which he called the Friendly isles. He next fell in with the islands discovered by Quiros, and having surveyed them all, denominated them the New Hebrides. He next discovered a large island, which he called New Caledonia; and another, named by him Norfolk island, which has since been colonized. After many other additions to our geographical knowledge, but without attaining the main object, he arrived safe at Spithead, July 30, 1775, during which perilous voyage, only one man had died out of 118 on board the Resolution, owing to the excellent means adopted by him for preserving the health of his crew: Of these he gave an account in a paper transmitted to the Royal Society, of which body he was chosen a member, and had the gold medal awarded him in 1776. He was now raised to the rank of post Captain, and appointed to a post in Greenwich hospital. The admiralty having resolved to determine the disputed question, whether there be a northern communication between the Atlantic and Pacific oceans, captain Cook willingly volunteered his services on the occasion, and July 12, 1776, sailed from Plymouth in the Resolution, accompanied by another vessel called the Discovery. He carried out with him a native of the Society islands, named Omai, whom he had brought to England at his own request. After touching at Otaheite, the captain's favourite spot, he sailed to Huaheine, where Omai was landed with his presents, which he had received in England. Sailing from thence our navigators fell in with a groupe of islands, to which, out of compliment to the first lord of the admiralty, was given the appellation of the Sandwich islands. Then steering for the north-west coast of America, they arrived at a place called Nootka Sound. On this coast they discovered a vast inlet, which at first seemed to indicate the opening of the communication they were in search of, but it proved to be only a large river, which was called Cook's river. After sailing as high as lat. $74^{\circ} 44' N.$ and being opposed by an impenetrable mass of ice, the ships were obliged to shift their course to the south, and November 26, 1778, reached the Sandwich islands. Here they met at first with a kind reception from the natives, but the daring thefts committed by the savages produced quarrels, and threatened hostilities. At length the islanders proceeded so far as to steal the cutter belonging to the Resolution, which being a serious object, captain Cook armed two boats, and went on shore with a design of seizing the person of the king, which had been his custom on these occasions. But in the present instance it proved fatal, for the natives armed themselves, and gathered in such numbers, that the captain renounced his purpose, and hastened to his boats. The

savages, however, pressed on, throwing stones; the marines then fired, but four of them were knocked down and killed. In this scene of confusion captain Cook preserved his wonted coolness, and remained the last man on shore; but just as he reached the water side he received a blow from a club, which brought him down on one knee, and as he was rising he received a stab with a dagger, and fell prostrate. He was soon dispatched by the savages, who carried off his body in triumph. Some of his bones were afterwards recovered, the flesh in all probability having been feasted on by the savages who are known to eat the dead bodies of their enemies. Such was the melancholy fate of this great man, February 14, 1779. He left a widow and several children who were provided for by the royal bounty. Captain Cook was a tall robust man, of placid temper; modest, affable, and persevering; and a father to his crew, by whom he was regarded with veneration. His name is revered for having enlarged the stock of valuable knowledge, and he will ever be regarded as a honour to his country. We must not conclude this article without taking notice of the honours paid to our celebrated navigator after his death, both by his own countrymen and those of other nations. Perhaps indeed it may be said with justice, that foreigners hold his memory in an estimation unequalled even in this country; a remarkable proof of which occurs in the eulogy upon him by Michael Angelo Gianetti, read in the Florentine academy on the ninth June, 1785, and published at Florence. One of the French literary academies, too, proposed a prize for the best eulogium on captain Cook; but the most striking evidence of the esteem in which he and his important discoveries were held by foreigners, was given by the French court itself, at the very time when France was at war with Britain. This happened in 1779, after his death, but before it was known in Europe; when a letter was issued by M. de Sartine, secretary to the marine department of France, and sent to all the commanders of French ships, importing, that captain Cook should be treated as the commander of a neutral and allied power; and that all captains of armed vessels who might meet with him, should make him acquainted with the king's orders, but at the same time let him know, that, on his part, he must refrain from hostilities. This humane and generous proceeding, with regard to France, originated from M. Turgot; but the thought seems first to have struck Dr. Franklin. This at least is certain, that the doctor, while ambassador from the United States, wrote a circular letter to the American naval commanders to the same purport. The Royal Society of London resolved to testify their respect to him by a medal, for which purpose a voluntary subscription was opened. A gold medal was given to such of the fellows as subscribed 20 guineas, and a silver one for those who subscribed smaller sums; and each of the other members received one of bronze. Those who subscribed 20 guineas, were, Sir Joseph Banks, president, the Prince of Anspach, the D. of Montague, Lord Mulgrave, and Messrs. Cavendish, Peachy, Perrin, Poli, and Shuttleworth. Many designs were proposed on the occasion; but the following was preferred, and struck. On one side was the head of captain Cook in profile, with this inscription round it, JAC. COOK OCEANI INVESTIGATOR ACERRIMUS; and on the exergue, REG. SOC. LOND. SOCIO SUO. On the reverse is a representation of Britannia holding a globe, with this inscription round her, NIL INTENTATUM NOSTRI LIQUERE; and on the exergue AUSPICHS GEORGH III. One of the gold medals struck on this occasion was presented to the king, another to the queen, and a third to the prince of Wales. A 4th was sent to the French king on account of the protection he had granted to the ships; and a 5th to the Empress of Russia, in whose dominions they had been treated with every expression of friendship and kindness. Both these great personages accepted of the presents with marks of satisfaction. Lewis XVI. wrote a handsome letter to the Society, signed by himself, and undersigned by the Marquis de Vergennes; and Catharine II. commissioned Count Osterman to signify to Mr. Fitzherbert the sense she had of the value of the present, and that she had caused it to be deposited in the museum of the Imperial Academy of Sciences. She also presented to the Royal Society a large and beautiful gold medal, containing on one side her own effigies, and on the other a representation of the statue of Peter the Great. After the general assignment of the medals, which took place in 1784, there being a surplus of money still remaining, it was resolved by the president and council, that an additional number

of medals should be thrown off, to be disposed of in presents to Mrs. Cook, the E. of Sandwich, Dr. Benjamin Franklin, Dr. Cooke, provost of King's College Cambridge, and Mr. Planta. Mr. Aubert was also allowed to have a gold medal of captain Cook on his paying for the gold and the expence of striking it, to present to the king of Poland. During the two visits of the ships at Kamtschatka, Colonel Behm, commandant of that province, had bestowed every kind of assistance in his power; and such was the sense entertained by the lords of the admiralty of the kindness he had shewed, that they determined to make him a present of a magnificent piece of plate, with an inscription, expressive of his humane and generous conduct, which was drawn up by Dr. Cooke. Sir H. Palliser, who had all along an uncommon respect and kindness for captain Cook, likewise displayed his regard for his memory, by erecting, on his estate in Buckinghamshire, a small building with a pillar, containing the character of captain Cook, which was drawn up by Admiral Forbes, to whom he was known only by his merit. Amidst all these expressions of unavailing praise, it was not forgotten to do essential service to the widow and family of our celebrated navigator. A memorial for a pension was given in to the king from the commissioners of the admiralty, and a grant was passed, by which 200*l.* per. annum were settled on the widow during life; and 25*l.* year on each of her three sons. After her death the 200*l.* was to be divided between her children; a fourth was allotted to captain King, and the remaining fourth to Mr. Bligh and the representatives of captain Clerke. The last honour paid to the memory of captain Cook, was the granting of a coat of arms to the family, which was done by patent on 3d of September, 1785.

COOK'S RIVER, a large river of N. America, which runs into the N. Pacific Ocean.

COOK'S STRAIT, a strait in the S. Pacific Ocean, which divides the two islands of New Zealand.

COOKIÆ, in botany, a genus of the class and order decandria monogynia. Calyx five-cleft, inferior; corolla five-petaled, equal, inferior; pome five-celled; the cells one seeded. One species found in China.

COOKING, COOKERY, the art of dressing or preparing food. It is effected by various methods, of which boiling is the most common, but also the most objectionable; as it deprives flesh of its nutritious juice. A better mode of dressing animal food is roasting, by which its strength is less dissipated; because a crust is soon formed on its surface, that more effectually preserves the nutritive particles from evaporation. Hence, one pound of roasted meat is, in real nourishment, equal to double that quantity of boiled animal food. Many substances, though naturally possessed of salubrious qualities, are rendered unwholesome, by the refinements of cookery. By compounding several incongruous ingredients, to produce a poignant sauce, or rich soup, the cook frequently forms compositions that are almost poisonous. Thus, high-seasoning of every kind, pickles, and the like, merely stimulate the palate, and cannot fail to injure the stomach. Hence the plainest dishes are uniformly the most conducive to health, while they are most easily digested. This self-evident proposition is acknowledged by every reflecting person, but gives the least satisfaction to the epicure who consults his taste before he appeals to his warped understanding. Animal food is generally boiled in half-open vessels, instead of which close utensils only ought to be employed for that purpose. We therefore preferably recommend the process called stewing; as it is not only the most wholesome mode of dressing meat, but at the same time well adapted to retain and concentrate the most substantial parts of animal food. The utility of preparing victuals after this method, having been generally acknowledged, various patents have been granted to persons for the invention of machinery, by which that object may be attained, at the smallest expence. Of these, we shall communicate the following; for the better illustration of which we shall give the figures. A patent was granted, in December 1793, to Mr. Stanley Howard, of St. Paul's Church-yard, iron-monger, for his invention of a machine which he calls a Pneumatic Kitchen, for cooking provisions by steam; in such a way, that no complex machinery is required for supplying the boiler with water, to replace the quantity dissipated by evaporation, nor any pump (the boiler being constantly supplied during the evaporation, without the aid of a cistern); which apparatus may be fixed at a small

expence, without any alteration of the chimney; and, when once arranged, requires no repair. The steam-boiler, and cooking-vessels, being made in the usual way, the former is to be supplied with water by a fountain-reservoir, marked A, Plate XLVII. fig. 12, which is to be placed at a convenient distance from it, with its discharging tube, marked B, inserted in a cistern, or pipe, marked C; in which the surface of the water will, by means of the fountain, be preserved always at one height, pointed out by the letter D: and by a communication marked E, from the said cistern or pipe, with the steam-boiler, marked F, the water therein will, during the evaporation, be preserved at a height corresponding with such cistern or pipe, and always at the same level, marked G. By means of the fountain above-mentioned, the necessity of cocks and pipes, or pumps, for supplying the boiler, is obviated; and the supply rendered more immediate, more certain, and at the same time more simple, than by any method hitherto contrived. The fountain may be made of any materials, or in any form, suited to the purpose. A patent was likewise granted, in December 1796, to Mr. James Tate, of Tottenham court-road, iron-monger, for a portable cooking machine, for the use of officers in the army or navy, which is provided with lamps. The patentee directs a lamp to be made with any number of burners, or wicks, according to the size of the machine, and they should be placed in one or more straight lines. To one side of this lamp he fixes an oven, for the purpose of washing, or baking; one side of the former is applied to one of the latter, in an inclined direction, so as to come in contact with the flame of the wicks. On the other side of the lamp, he places another oven, which may be either with a straight side next the lamp, or may incline in the same direction as the former; but, if this latter oven incline from the flame, it will serve only to keep any fluid, or solid substances in a hot state. The two sides of the ovens will form a flue, or chimney, and convey the remainder of the heat upwards to a vessel of any shape, which may be put over them, for the purpose of raising steam, either to turn a jack, or boil water for tea, &c.; and on the top of which, another steaming vessel may be placed. A frying, or boiling pan may also be occasionally substituted for that last mentioned. Any of these utensils can be used separately with, or over, the lamp; and, if baking or roasting only be required, that purpose will be better effected, by having an oven so constructed as to receive the whole heat of the lamp, or lamps, which ought to be surrounded with a case, for confining the flame, with an open space at the bottom to admit the heat, and another at the top to give it vent. The following is a description of the different articles, as they are combined to form this machine, when made portable. R, Plate XLVII. fig. 13, is the lamp for the machine. Fig. 14 is the lamp, in combination with the two ovens, and the boiler or vessel for raising steam, and boiling any substance in water. P, is the baking oven. Q, is the heating oven. R, is the end of the lamp; and S, is the vessel for boiling in, and raising steam for other purposes. This machine, and its various component parts, may be constructed of any of the different metals, of which similar articles are usually made. And, though it is at present described only as operating with a lamp and oil, yet the patentee proposes to construct such as may be used with common fuel.

COOLER, among brewers, distillers, &c. a large vessel where-in certain liquors are cooled, after having been boiled.

COOMB, or **COMB**, [*comble*, Fr. *cumulus*, Lat. a heap,] a measure of corn containing four bushels.

COOMTAH, a town of Hindostan, in Berar, 45 miles N. E. of Nagpour.

COOP, in husbandry, a tumbrel or cart inclosed with boards, and used to carry dung, grains, &c.

COOPER, ANTHONY-ASHLEY, first earl of Shaftesbury, was the son of Sir John Cooper, Bart. of Rockborn in Hampshire, and was born in 1621. He was elected M. P. for Tewkesbury at 19 years of age, in the short parliament that met April 13, 1640. He seems to have been well affected to the king's service at the beginning of the civil wars; for he repaired to the king at Oxford with offers of assistance: but prince Maurice breaking articles with a town in Dorsetshire, that he had got to receive him, he went over to the parliament, from which he accepted a commission. When Richard Cromwell was deposed, and the Rump parliament came again into power, they nominated Sir Anthony one of their council,

council of state, and a commissioner for managing the army. At that very time he had engaged in a secret correspondence for restoring Charles II. and, upon the king's coming over, was sworn of his privy council. He was one of the commissioners for the trial of the regicides; and was soon after made chancellor of the exchequer, then a commissioner of the treasury; in 1672 was created earl of Shaftesbury; and soon after was raised to the post of lord chancellor. He filled this office with great ability, and though the short time he was at the helm was in a tempestuous season, nothing could either distract or affright him. The great seal was taken from him in 1673, twelve months after his receiving it; but, though out of office, he still made a distinguished figure in parliament. He drew upon himself the implacable hatred of the duke of York, by steadily promoting, if not originally inventing, the famous exclusion bill. When his enemies came to power, he retired into Holland, where he died six weeks after his arrival, in 1683. His great abilities are confessed by all, though Butler has given a very severe character of him in his "Hudibras."

COOPER, ANTHONY-ASHLEY, third earl of Shaftesbury, was son of Anthony the second, and grandson of Anthony the first earl. He was born in 1671, at Exeter house in London, where his grandfather lived, who from his birth conceived so great an affection for him, that he undertook the care of his education; wherein he made such progress that he could read with ease both Latin and Greek, when only eleven years old. In 1683, his father carried him to Winchester school, where being insulted on his grandfather's account, by the zealots for despotism, he prevailed with his father to consent to his going abroad, in 1686. He returned to England in 1689, and was offered a seat in parliament, but did not accept it, that he might not be interrupted in the course of his studies, which he prosecuted five years with great success; till, on Sir John Trenchard's death, he was elected M. P. for Pool. Soon after his coming into parliament, he had an opportunity of expressing that spirit of liberty, which uniformly directed his conduct, by bringing in "the bill for regulating trials in cases of high treason." After the dissolution of parliament in 1698, he went to Holland, where the conversation of Mr. Bayle, M. le Clerc, and several other learned men, induced him to reside a year. During this time, there was printed at London, in 8vo. an imperfect edition of lord Ashley's "Inquiry concerning Virtue." It had been surreptitiously taken (by Mr. Toland, it is said,) from a rough draught, sketched when he was only twenty years of age. His lordship immediately bought up the impression before many books were sold, and completed the treatise, as it afterwards appeared in the second volume of his "Characteristics." In 1703, he made a second journey to Holland, and returned to England in 1704. His "Letter concerning Enthusiasm," was published in 1708. His "Moralist, a philosophical Rhapsody, being a recital of certain Conversations on natural and moral Subjects," appeared in Jan. 1709; and in May following, his "Sensus Communis, an Essay upon the Freedom of Wit and Humour, in a Letter to a Friend." In 1710, his "Soliloquy, or Advice to an Author," was published at London in 8vo. While he was thus employing himself in literary composition, his health declined so fast, that he was advised to go to a warmer climate. Accordingly, in July 1711, he set out for Naples, and took his journey by way of France. After having resided at Naples about a year and a half, he died the 4th Feb. O. S. 1712-13, aged 42. The only pieces which he finished at Naples, were "The Judgement of Hercules," and the "Letter concerning Design." In 1711, the first edition was published of all the characteristics together, and in the order in which they now stand. But a more elegant edition was given to the world in 1713, soon after his decease. The several prints that were then first interspersed through the volumes were all invented by himself, and designed under his immediate inspection; and for this purpose he drew up a most accurate set of instructions, the MS. of which is still preserved in the family. To prevent mistakes, the earl corrected the press himself. In the three volumes of the "Characteristics of Men, Manners, Opinions, and Times," he completed the whole of his works which he intended for the public eye. He had a fine taste in painting and sculpture, and had thoughts of writing on these subjects; which his premature decease prevented. By many authors lord Shaftesbury is ranked among the deists, while others think that he ought not to be reckoned among the deistical writers.

In support of his Lordship's having been a believer in our holy religion, have been urged his "Preface to Whichcot's Sermons," and his "Letters to a Student at the University;" in both which works he expresses himself in such language as seems to indicate that he believed the sacred scriptures. Nevertheless, there are in the "Characteristics" so many sceptical passages, that he must be considered as having been a doubter at least, if not an absolute disbeliever, with respect to revelation.

COOPER, JOHN GILBERT, a polite writer, born in 1723. After studying at Westminster school under Dr. John Nicoll, he became in 1743, a Fellow Commoner of Trinity college, Cambridge; but quitted the university on his marriage with Susanna the daughter of William Wright, Esq. Recorder of Leicester. In 1745 he published "The Power of Harmony," a poem in 4to. and in 1746 and 1747, several Essays and Poems, signed Philalethes, in Mr. Dodsley's "Museum." With the assistance of the Rev. John Jackson of Leicester, he published with his name, "The Life of Socrates, collected from the Memorabilia of Xenophon and the Dialogues of Plato," and illustrated by Aristotle, Diodorus Siculus, Cicero, Proclus, Apuleius, Maximus Tyrinus, Boethius, Diogenes, Laertius Aulus, Gellius, and others, 1749, 8vo. In this work Mr. Cooper gave evident marks of superior genius. In 1754, he published his "Letters on Taste," 8vo.; an elegant volume, on which no small share of his reputation is founded; and in 1755, "The Tomb of Shakespeare, a Vision," 4to. In 1756, he assisted Mr. Moore, by writing some numbers of "The World;" and attempted to rouse the indignation of his countrymen against the Hessians, then brought over to defend the nation, in a poem called "The Genius of Britain," addressed to Mr. Pitt. In 1758, he published "Epistles to the Great, from Aristippus in Retirement," 4to.; and "The Call of Aristippus," Epistle IV. to Mark Akenside, M. D. Also, "A Father's Advice to his Son," in 4to. In the Annual Register of 1758, is his Translation of an Epistle from the King of Prussia to Monsieur Voltaire. In 1759, he published "Ver Vert; or, the Nunnery Parrot," an Heroic Poem, in four cantos; inscribed to the Abbess of D***, 4to.; and, in 1764, "Poems on several Subjects, by the Author of the Life of Socrates;" with a prefatory Advertisement by Mr. Dodsley. He died at his father's house in May-Fair, after a long and excruciating illness arising from the stone, April 14, 1769.

COOPER, in geography, a large navigable river of the United States, which unites the Ashley below Charleston city, in South Carolina.

COOPER, one who manufactures casks, tubs, pails, and some other similar articles used in domestic concerns. These are made generally of oak timber; a great part of which comes from America, cut up into narrow pieces or staves; they are sometimes bent and sometimes straight, according to the purposes for which they are wanted. The staves are kept together by means of hoops, made from hazel or ash, or of iron. To make them hold water or other liquids, split flags are inserted, which swell by moisture, and effectually prevent the vessels from leaking. Coopers, by 23 Hen. VIII. c. 4, shall make their vessels of seasonable wood; and make them with their own marks, on forfeiture of 3s. 4d.: and the contents of vessels are appointed to be observed under a like penalty.

COOPER, KING's, an officer in every custom-house and excise office.

COOPER, on board a ship, he that looks to the casks, and all other vessels for beer, water, or any other liquor. He has a mate under him.

COOPER'S ISLAND, an island on the N. coast of the isle of Java, near Batavia.

COOPER'S ISLAND, an island in the South Pacific Ocean, near South Georgia.

COOPER'S ISLAND, one of the lesser Virgin Isles in the West Indies.

COOPER'S TOWN, a post town of New York, in Otsego county.

COOPER'S TOWN, a town of Pennsylvania, situated on the Susquehanna.

COOS, or COS, an island in the Archipelago, 56 miles N. W. of Rhodes.

COOS, or COHOS, a territory of New Hampshire, on the Connecticut.

COOSACTEES,

COOSACTEES, a tribe of the Creek, or Muskogulge Indians in North America. See **MUSKOGULGE**.

COOSY, or **COSA**, a river of Asia, which rises in the mountains of Thibet.

COOTS, or **COOTSTOWN**, a town of Pennsylvania, in Berks county.

COPAIBA, or **BALSAM OF COPAIBA**, a liquid resinous juice, flowing from incisions made in the trunk of the *copaifera* officialis. It is transparent, of a whitish or pale yellowish colour, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker: when long kept, it becomes nearly as thick as honey, retaining its clearness; but does not grow dry or solid, as most other resinous juices do. The balsam of copaiba is an useful corroborating detergent medicine, accompanied with a degree of irritation. It strengthens the nervous system, tends to loosen the belly, in large doses proves purgative, promotes urine, and cleanses and heals exulcerations in the urinary passages, which it is supposed to perform more effectually than any other balsams. The dose rarely exceeds twenty or thirty drops, though some direct sixty or more. It may be taken in the form of an eleosaccharum, or in that of an emulsion, into which it may be reduced by triturating it with almonds, or rather with a thick mucilage of gum-arabic, till they are well incorporated, and then gradually adding a proper quantity of water.

COPAIFERA, in botany, a genus of the monogynia order, and decandria class of plants. No calyx; petals four; legumen ovate; seed one, with an arillus. One species, viz.

C. OFFICINALIS. This tree grows near a village called Ayapel, in the province of Antiochi, in the Spanish West Indies, about ten days journey from Carthagena. Great numbers of these trees grow to the height of fifty or sixty feet. Some of them do not yield any balsam; those which do, are distinguished by a ridge which runs along the trunks. They are wounded in the centre, and calabash shells, or other vessels, are placed at the wounded part to receive the balsam, which flows wholly out in a short time. One of these trees will yield five or six gallons of balsam: but though they will thrive well after being tapped, yet they never afford any more balsam.

COPAL, a substance of great use as a varnish, which is obtained from the *rhus copalinum*, a tree in North America. It is a beautiful transparent resinous-like substance. When heated it melts like other resins; but it differs from them in not being soluble in alcohol, nor in oil of turpentine without peculiar management. Neither does it dissolve in the fixed oils like other resins. The specific gravity of copal varies from 1,045 to 1,139. Mr. Hatchett found it soluble in alkalies and nitric acid with the usual phenomena; so that in this respect it agrees with the other resins. The solution of copal in alkalies he found indeed opalescent, but it is nevertheless permanent. It deserves attention, that he found resin when dissolved in nitric acid, and then thrown down by an alkali, to acquire a smell resembling that of copal. When copal is dissolved in any volatile liquid, and spread thin upon wood, metal, paper, &c. so that the volatile menstruum may evaporate, the copal remains perfectly transparent, and forms one of the most beautiful and perfect varnishes that can well be conceived. The varnish thus formed is called copal varnish, from the chief ingredient in it. This varnish was first discovered in France, and was long known by the name of vernis martin. Copal varnished used by the English jannpers is made as follows: Four parts by weight of copal in powder are put into a glass matrass and melted: The liquid is kept boiling till the fumes, condensed upon the point of a tube thrust into the matrass, drop to the bottom of the liquid without occasioning any hissing noise as water does. This is a proof that all the water is dissipated, and the copal has been long enough melted. One part of boiling hot linseed oil (previously boiled in a retort without any litharge) is now poured into it, and well mixed. The matrass is then taken off the fire, and the liquid, while still hot, is mixed with about its own weight of oil of turpentine. The varnish thus made is transparent, but it has a tint of yellow, which the jannpers endeavour to conceal by giving the white ground on which they apply a shade of blue. It is with this varnish that the dial plates of clocks are covered after having been painted white. Mr. Sheldrake has lately favoured the public with another and easier method of dissolving copal. This method is as follows: "Provide a strong vessel made of tin or other metal; it should be shaped like a wine bottle, and capable of

holding two quarts; it will be convenient to have a handle strongly riveted to the neck; the neck should be long and have a cork fitted to the mouth, but a notch or small hole should be made in the cork, that, when the spirit is expanded by heat, a small portion may force its way through the hole, and thus prevent the vessel from bursting. Dissolve half an ounce of camphor in a quart of spirit of turpentine, and put it into the vessel; take a piece of copal the size of a large walnut, reduce it to a coarse powder or very small pieces, put them into the tin bottle, fasten the cork down with a wire, and set it, as quick as possible, upon a fire so brisk as to make the spirit boil almost immediately; then keep it boiling very gently for about an hour, when so much of the copal will be dissolved as will make a very good varnish; or, if the operation has been properly begun, but enough of copal has not been dissolved, it may be again put on the fire, and by boiling it slowly for a longer time, it may be at last brought to the consistence desired.

COPARCENARY. An estate held in coparcenary, is where lands of inheritance descend from the ancestor to two or more persons. It arises either by common law, or particular custom. By common law, as where a person seised in fee-simple, or fee-tail dies, and his next heirs are two or more females, his daughters, sisters, aunts, cousins, or their representatives; in this case they shall all inherit. And these co-heirs are then called coparceners; or for brevity sake parceners. Parceners, by particular custom, are where lands descend, as in gavel-kind, to all the males in equal degree, as sons, brothers, uncles, or other kindred; and in either of these cases, all the parceners put together make but one heir, and have but one estate among them.

COPE, in Doomsday Book, as Mr. Hager has interpreted it, signifies a hill.

COPE is also the name of an ancient tribute paid to the king or lord of the soil, out of the lead mines in Derbyshire.

COPELAND ISLANDS, three islands, in the Irish Sea, on the coast of Down; near Carrickfergus Bay. Their names are Big, Cross, and Mew. Lon. 5. 53. W. Lat. 54. 33. N.

COPENHAGEN, anciently called Kiobmandshaven, the capital of the kingdom of Denmark, situated on the E. shore of the island of Zealand, upon a fine bay of the Baltic sea, near the strait called the Sound. Copenhagen lies 300 miles S.W. of Stockholm, and 500 N. E. of London. Lon. 12. 40. E. Lat. 55. 41. N.

COPERNICAN SYSTEM, that system of the world, wherein the sun is supposed to rest in the centre, and the planets, with the earth, to move in ellipses round him. See **ASTRONOMY**.

COPERNICUS, NICOLAUS, an eminent astronomer, born at Thorn in Prussia, Jan. 10, 1472. He was taught the Latin and Greek languages at home; and afterwards studied philosophy and physic at Crotovia. His genius being naturally turned to mathematics, he pursued that science through all its various branches. He set out for Italy when he was 23 years of age; but staid at Bononia some time, with the celebrated astronomer Dominicus Maria; whom he assisted in making his observations. From thence he passed to Rome, where he soon acquired so great reputation, that he was chosen professor of mathematics. He also made some astronomical observations about A. D. 1500. Returning to his own country some years after, he began to apply his vast knowledge in mathematics, to correct the system of astronomy which then prevailed. He collected all the books which had been written by astronomers, and examined the various hypotheses invented for the solution of the celestial phenomena. Of all these, none pleased him so well as the Pythagorean, which made the sun to be the centre of the system, and supposed the earth to move not only round the sun, but round its own axis also. He discerned much beautiful order and proportion in this; and that all that embarrassment and perplexity from the epicycles and eccentrics, which attended the Ptolemaic hypothesis, were here entirely removed. This system, then, he began to write upon, when he was about 35; and after more than twenty years, he brought his scheme to perfection, and established that system of the world which is now universally received. See **ASTRONOMY**. His system, however, was then looked upon as a most dangerous heresy; for which he was thrown into prison by Pope Urban VIII. and not suffered to come out till he had recanted his opinion, and thus renounced the testimony of his senses. He died May 24, 1543, aged 70. This extraordinary man had been made canon of Worms

by his mother's brother, Lucas Wazelerodius, who was bishop of that place. He was not only the greatest of astronomers, but a perfect master of the Greek and Latin tongues, and a man of the greatest piety and innocence of manners.

COPITI, the **COPHTS**, a name given to the Christians of Egypt, who are of the sect of Jacobites. The critics differ much about the orthography, as well as the etymology, of this word. Some write it Cophiti; others Copti, Cophitæ, Cophitæ, Copts, &c. Scaliger derives the name from Coptos, an anciently celebrated town of Egypt, the metropolis of the Thebaid. Kircher maintains, that the word originally signifies cut or circumscribed; and was given them on account of their practising circumcision; Scaliger afterwards derived the word from *Agyptos*, the ancient name of Egypt, by retrenching the first syllable: but P. Sollier disputes both these opinions. John de Leo and others say, that the Egyptians anciently called their country Elchibth or Cibth, from Cibth their king, whence Cophitæ, &c. others say from Coptim second king of Egypt. Vansleb derives Cophit from Copt, or Capthorim, the son of Misraim, grandson of Noah. All these etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called Cophiti; whereas, in effect, none but the Christians, and among those none but the Jacobites, bear the name, the Melchites not being comprehended under it. Hence he derived the word from the name Jacobite, retrenching the first syllable; whence Cobite, Cobea, Copta, and Cophita. The Cophits have a patriarch who resides at Cairo, but he takes his title from Alexandria: he has under him eleven or twelve bishops. The rest of the clergy, whether secular or regular, is composed of the orders of St. Antony, St. Paul, and St. Macarius, who have each their monasteries.

COPHTIC, or **COPTIC**, the language of the Cophits, the ancient language of the Egyptians, mixed with a deal of Greek, the characters it is written in being all Greek. It has a form and construction peculiar to itself: it has no inflections of the nouns or verbs; but expresses number, case, gender, person, mood, tense, and possessive pronouns, by letters and particles prefixed. F. Kircher was the first who published a grammar and vocabulary of the Coptic. There is not known any book extant in the Coptic, except translations of the Holy Scriptures, or of ecclesiastical offices; or others that have relation thereto, as dictionaries, &c. The ancient Coptic is now no longer found but in books; the language now used throughout the country being Arabic. The old Coptic, which Kircher maintains to be a mother tongue, and independent of all others, had been much altered by the Greek; for besides that it has borrowed all its characters from the Greek, with a very little variation, a great number of words are pure Greek. Vossius, indeed, asserts, that there was no Coptic language till after Egypt became subject to the Arabs. The language, according to him, is a mixture of Greek and Arabic: the very name thereof not being in the world till after the Arabs were masters of the country. But this, M. Simon observes, proves nothing; except that what was anciently called Egyptian, has since by the Arabs been called Coptic, by a corruption of speech. There are, it is true, Arabic words in the Coptic; yet this by no means proves but that there was a language before that time, either Coptic or Egyptian.

COPIAPO, a district of South America, in the N. of Chili, which abounds in minerals of all kinds.

COPIATA, [from *κοπω*, to cut,] a grave-digger. In the first ages of the church, clerks were destined for this employment. A. D. 357, Constantine made a law in favour of the priests *copiata*, i. e. of those who had the care of interments; whereby he exempted them from the lustral contributions.

COPILOWATS, a town of European Turkey in Bulgaria. Lon. 27. 30. E. Lat. 43. 40. N.

COPING OVER, in carpentry, a sort of hanging over, not square to its upright, but bevelling on its under side, till it ends in an edge.

COPORIA, a town and river of Russia, in the province of Ingria.

COPPA, in law, a cop or cock of grass, hay, or corn, divided into titheable portions; as the tenth cock, &c. This word denotes laying up the corn in cops or heaps, not bound up, that it may be the more fairly tithed: and in Kent they still retain the word, a cop or cap of hay, straw, &c.

COPPEL, **COPEL**, **CUPEL**, or **CUPPEL**, a chemical vessel made of earth, pretty thick, and of the form of a platter or dish. See **CUPEL**.

COPPER, a very useful metal, which is found in the bowels of the earth, in the following states:

I. Native or pure copper, which possesses the red colour, the malleability, and all the other properties of this metal, and is discovered in various parts of England and Wales, but more particularly in the county of Cornwall. It is formed into threads of branches, and lies in veins of considerable thickness, contained in blackish serpentine stone, mixed with a brownish red, and covered externally with a greenish nephrites.

II. Mineralized by fixed air; of which there are several varieties: 1. Red copper, or hepatic ore of copper, which is known by its dusky colour. It is generally mixed with native copper and mountain green. 2. Earthy copper, or mountain green, which is mostly found in a loose friable state, and frequently blended with calcareous earth, iron, and sometimes with arsenic.

III. Mineralized by sulphur, with a small proportion of iron. This is of a deep violet grey, or liver colour, melts with a gentle heat, is ponderous, flexible, and yields to the knife. When broken, it appears of a bright golden colour, and is the richest of all the copper ores, affording from 80 to 90 per cent. of copper, 10 or 12 of sulphur, and a small proportion of iron.

IV. Mineralized by sulphur, with a large proportion of iron, or azure copper ore; it varies from the preceding sort only in the quantity of iron it contains, which sometimes amounts to 50 per cent. It yields 50 or 60 pounds of copper per cwt. the rest being sulphur. The principal parts of Great Britain, which afford copper, are the counties of Cardigan, Chester, Cornwall, Cumberland, Derby, Devon, Northumberland, Lancaster, Salop, Somerset, Stafford, York, Warwick, Westmoreland; in the Islands of Man and Anglesey; and also in Scotland. Copper is a very brilliant metal, of a fine red colour, differing from every other metallic substance. The specific gravity of copper is 8.58. When it is hammered it acquires a greater density. It possesses a considerable degree of hardness, and some elasticity. It is extremely malleable, and may be reduced to leaves so fine, that they may be carried about by the wind. It has also a considerable degree of ductility, intermediate, according to Guyton, between tin and lead. The tenacity of copper is also very great. A wire .078 of an inch in diameter will support a weight without breaking equal to more than 300lbs. avoirdupois. Copper has a peculiarly astringent and disagreeable taste. Copper does not melt till the temperature is elevated to a red heat, which is about 27° Wedgwood, or by estimation 1450° Fahrenheit. When it is rapidly cooled after fusion, it assumes a granulated and porous texture: but if it be cooled slowly, it affords crystals in quadrangular pyramids, or in octahedrons, which proceed from the cube, its primitive form. When the temperature is raised beyond what is necessary for its fusion, it is sublimed in the form of visible fumes. Copper soon tarnishes, and exposed to the air, especially if it be humid, is deprived of its lustre, and at last is covered with a shining green crust, which is well known under the name of verdigris. This effect is produced by the absorption of oxygen from the atmosphere, by which the metal is oxygenated. As this oxide is formed, the carbonic acid of the atmosphere combines with it, so that it is to be considered as a mixture of oxide and carbonate of copper. But when copper is subjected to a strong heat, the oxidation proceeds more rapidly. If a plate of copper be made red-hot in the open air, it loses its brilliancy, becomes of a deep brown colour, and the external layer, which is of this colour, may be detached from the metal. This is the brown oxide of copper. This oxide may be obtained by immersing a plate of red-hot copper into cold water. The scales which are formed on the surface fall off by the sudden contraction of the heated copper. This may be repeated till the whole is converted into the oxide. The copper in this state is in the highest degree of oxidation. The component parts of this oxide are,

Oxygen,.....	25
Copper	75
	100

There are, however, different oxides; copper combines with a smaller

smaller proportion of oxygen, forming an oxide of an orange colour. This is the oxide of copper with the smaller proportion of oxygen. The component parts of this oxide, according to Mr. Chevreux, are.

Oxygen.....	11,5
Copper.....	88,5
	100,0

This oxide changes colour the moment it is exposed to the air, by the absorption of oxygen, for which it has a very strong affinity. There is no action between azote, hydrogen, or carbon, and copper. Phosphorus readily combines with copper, and forms with it a phosphuret, which is prepared by fusing equal parts of copper and phosphoric gas, with $\frac{1}{2}$ th of the whole of charcoal in powder. Copper combines with sulphur by different processes. If sulphur in powder and filings of copper are mixed together, and formed into a paste with a little water, when they are exposed to the air, the mass swells up, becomes hot, and is converted into a brown matter, which effloresces slowly in the air, and is converted into sulphate of copper. The alloys of copper (that is, those in which this metal predominates) are more numerous and more important in the arts than those of any other metal. Many of them are perfectly well known, and have been in use from very ancient times; of many the exact composition, and particularly the mode of preparing, are kept as secret as possible; for even when the precise composition of an alloy is found by chemical analysis, it may often be extremely difficult to produce a mixture by common methods, which shall have exactly the same shade of colour, the same malleability, texture, susceptibility of polish, or some other excellence, which, perhaps, a mere accident has discovered to the possessor. The principal objects of alloying copper appears to be to render it less liable to tarnish, and especially to be acted on by common animal or vegetable substances, to make it more fusible, and harder, and able to take a higher polish, and to alter its colour either to a golden yellow or silvery white. All these objects are attainable by different alloys. Copper alloyed with gold, silver, and platina, is seldom, if ever, used in the proportions in which it would be reckoned as alloy of copper, being much too costly for any purpose of manufacture; with this exception, however, that a very small portion of silver much improves the composition of the alloy of copper and tin, when used as bell-metal or speculum-metal. Copper is used largely as an alloy of gold and silver, and it is often plated with one or the other. Copper nearly saturated with zinc, forms brass, the most important of all the alloys of this metal. See BRASS. With a much less proportion of zinc the colour of the alloy approaches very nearly to that of gold, and the malleability increases. Mixtures chiefly of these two metals are used to form a variety of yellow or gold-coloured alloys, known by the names of tombac, Manheim, or Dutch gold, tinsel, similor, Prince Rupert's metal, Pinchbeck, &c.; but the precise composition varies according to the fancy or the experience of different manufacturers. The alloys of copper and tin are extremely important in the arts, and curious as chemical mixtures. They form, in different proportions, mixtures which have a distinct and appropriate use. Tin added to copper makes it more fusible; much less liable to rust or corrosion by common substances; harder, denser, and more sonorous. In these respects the alloy has a real advantage over unmixed copper; but this is in many cases more than counterbalanced by the extreme brittleness which even a moderate portion of tin imparts, and which is a singular circumstance, considering how very malleable both metals are before mixture, and the remarkable softness and ductility of tin. Copper, or sometimes copper with a little zinc, alloyed with as much tin as will make from about $\frac{1}{12}$ th to about $\frac{1}{4}$ th of the whole, forms an alloy which is the principal, and often the only composition for bells, brass cannon (so called,) bronze statues, and several smaller purposes, and hence it is called bronze, or bell-metal; and it is excellently fitted for these purposes, by its hardness, density, sonorousness, and fusibility, whereby the minute parts of hollow moulds may be readily filled before it fixes in cooling. For cannon a lower portion of tin seems to be used. Bronze cannon are much less liable to rust than those of iron; but in large pieces of ordnance, by very rapid firing, the touch-hole is apt to melt down, and spoil the piece; of which there is a remarkable instance at the Tower of London, of a mortar of the largest calibre thus spoiled at

the siege of Nemur. On account of the sonorousness of bronze, these cannon give a much sharper report than those of iron, which for a time impairs the hearing of the people that work them. A common alloy for bell-metal is about 80 of copper to 20 of tin; or where copper, brass, and tin, are used, the copper is from 70 to 80 per cent. including the portion contained in the brass, and the remainder is tin and zinc. The zinc certainly makes it more sonorous. Antimony is also often found in small quantities in bell-metal. Some of the finer kinds used for small articles contain also a little silver, which much improves the sound. When the tin is nearly one-third of the alloy, it is then most beautifully white with a lustre almost like that of mercury, extremely hard, very close-grained, and perfectly brittle. In this state it takes a most beautiful polish, and is admirably fitted for the reflection of light for all optical purposes. It is then called speculum metal, which, however, for the extreme perfection required in modern astronomical instruments, is better mixed with a very small proportion of other metals, particularly arsenic, brass, and silver. When taken into the human body, copper acts as a violent emetic, and is generally considered as poisonous: and, though it has occasionally been prescribed by physicians, it is always an unsafe and hazardous remedy. Hence, the greatest precaution is necessary in using this metal, of which so many kitchen utensils are manufactured. Besides the most scrupulous attention to cleanliness, it is extremely improper to leave any liquid to cool in a copper vessel; for this metal is more easily decomposed by liquids, when cold, than in a heated state. In order to prevent the deleterious effects of copper, the vessels made of it are usually covered with tin, on the inside. It is nevertheless justly complained, that the tinning of copper vessels is not sufficient to defend them from the action of the air, moisture, and saline substances; because, even when strongly coated, they are liable to rust. This may be remedied by a thicker covering of tin; and a manufacture of this kind was established a few years since at Edinburgh; in which the following method is adopted: The surface of the copper is made very rough, by means of a machine contrived for that purpose; then a thick coat of tin is laid on, and the copper hammered smooth as before. To prevent the tin from being melted, and the surface of the copper from being left uncovered, in consequence of a degree of heat superior to that of boiling water, the tin is alloyed with iron, silver, or platina, in order to diminish its fusibility, and render it capable of being applied in thicker layers on the copper.

COPPERAS, sulphate of iron, it is commonly called green-vitriol. It is purified and prepared in the same manner as alum and saltpetre, being passed through several lixivia, till it is wholly reduced to crystal. It is used in dyeing wool and hats black, in making ink, tanning leather, and in preparing a kind of Spanish brown for painters. A patent was granted in May 1791 to Mr. Wm. Murdock, of Redruth, Cornwall, for a method of making (from the same materials, and from processes entirely new) copperas, vitriol, and different sorts of dye, or dying stuff, paints, and colours. The patentee directs any quantity of what remains after the calcination of mundic, or such other ores as contain sulphur, arsenic, and zinc, to be taken, and washed in water; which is to be placed on the top, or on any other part of the kiln, house, or oven, while the mundic or other ores are burning; the heat of which will cause the water to evaporate; or the water may be evaporated to a crystallizing point, by exposing it to the heat of the sun, after which it should be suffered to stand for 24 hours, or longer, when crystals of copperas, or green vitriol, will be produced. From this process arises a considerable saving; as the ores remaining after fusion, may be applied to various chemical purposes.

COPPER-PLATE. See ENGRAVING.

COPROCRITICA, purgative medicines.

COPROSMA, in botany, a genus of the class and order, polygamia monœcia. Natural order Stellatæ. Calyx one-leaved, five-toothed; corolla five or six cleft; stamina five, six, or seven. Hermaphrodite styles two, long; berry containing two flattish seeds. There are two species, viz. *C. foetidissima*, and *C. lucida*, both shrubs; leaves opposite, with a stipule interposing. These are natives of New Zealand.

COPULA, in logic, the verb that connects any two terms in an affirmative or negative; as virtue makes a man happy; where makes is the copula; no weakness is any virtue; where is is the copula.

COPULATIVE PROPOSITIONS, in logic, those where the subject

ject and predicate are so linked together, by copulative conjunctions, that they may be all severally affirmed or denied one of another. *Example*, Riches and honours are apt to elate the mind, and increase the number of our desires.

COPY, [*copie*, Fr. *copla*, low Latin,] in a law sense, signifies the transcript of any original writing, as the copy of a patent, charter, deed, &c. A common deed cannot be proved by a copy or counterpart, where the original may be procured. But if the deed be enrolled, certifying an attested copy, is proof of the enrolment, and such copy may be given in evidence.

Copy is also used for the imitation of an original work, more particularly in painting, draught, figure, &c.

Copy, among printers, denotes the manuscript, or original of a book, given to be printed.

COPY-HOLD, [*copy* and *hold*,] a tenure, for which the tenant hath nothing to shew but the copy of the rolls made by the steward of his lord's court: for the steward, as he enrolls other things done in the lord's court, so he registers such tenants as are admitted in the court, to any parcel of land or tenement belonging to the manor; and the transcript of this is called the court roll, the copy of which the tenant takes from him, and keeps as his only evidence. This is called a base tenure, because it holds at the will of the lord; yet not simply, but according to the custom of the manor: so that if a copy-holder break not the custom of the manor, and thereby forfeit his tenure, he cannot be turned out at the lord's pleasure. These customs of manors vary in one point or other almost in every manor. Some copy-holds are finable, and some certain; that which is finable, the lord rates at what fine or income he pleases, when the tenant is admitted into it: that which is certain is a kind of inheritance, and called in many places customary: because the tenant dying, and the hold being void, the next of blood paying the customary fine, as two shillings for an acre, or so, cannot be denied his admission. Some copy-holders have, by custom, the wood growing upon their own land, which by law they could not have. Some hold by the verge in ancient demesne; and though they hold by copy, yet are they, in account, a kind of freeholder; for, if such a one commit felony, the king hath annum, diem, et vastum, as in case of freehold. Some others hold by common tenure, called mere copy-hold; and they committing felony, their land escheats to the lord of the manor. See **TENURE** and **VILLENAGE**.

COPY-HOLDER, one who is admitted tenant of lands or tenements within a manor, which time out of mind, by use and custom of the manor, have been demisable, and demised to such as will take them in fee-simple or fee-tail, for life, years, or at will, according to the custom of the manor by copy of court-roll; but is generally where the tenant has such estate either in fee or for three lives.

COPY-RIGHT, the right which an author has in his own compositions. See **LITERARY PROPERTY**.

COQUET, a river in Northumberland, which runs into the sea, seven miles S. of Alnwick.

COQUET, a small island of England, near the coast of Northumberland.

COQUIMBO, a port town of South America in Chili. Lon. 71. 11. W. Lat 29. 54. S.

COQUIMBO, a river of Chili, which falls into the Pacific Ocean.

COR CAROLI, in astronomy, an extraconstellated star in the northern hemisphere, situated between the coma Berenices, and ursa major; so called by Dr. Halley in honour of king Charles.

COR HYDRÆ, a fixed star of the first magnitude, in the constellation Hydra.

COR LEONIS, a fixed star of the first magnitude, in the constellation Leo.

CORACE, a river of Italy in Naples.

CORACIAS, the **ROLLER**, a genus of birds, order picæ. Bill straight, bending towards the tip, with the edges cultrated; nostrils narrow, naked; legs for the most part short; toes placed three before and one behind, and divided to their origin. One or other of the different species may be met with in all quarters of the globe. There are 16 species.

C. CYANÆA, the **BLUE-STRIPED ROLLER**, is in length 8 inches; the bill $\frac{1}{2}$ of an inch long, bent at the tip, and of a black colour; the irides are red: the general colour of the plumage deep blue black, dashed with streaks of greenish blue: the tails and legs are black. It inhabits New Caledonia. See **Plate XXXVIII**.

C. GARRULA, the **GARRULOUS ROLLER**, is about the size of a jay; the bill black; and at the base beset with bristles; the head, neck, breast, and belly, are of a light bluish green; back and scapulars reddish brown, coverts on the ridge of the wing rich blue, beneath pale green; upper part and tips of the quills dusky; the lower parts and rump of a fine deep blue; tail forked of a light blue. They are found in Sweden and Denmark on the one hand, and as far as Africa on the other.

CORACO BRACHIALIS, a muscle of the arm. See **ANATOMY**.

CORACOIDES, a small sharp process of the scapula. See **ANATOMY**.

CORACOMANTES, [*κοραες*, crows, and *μαντεια*, divination, Gr.] in antiquity, persons who foretold events from their observations on crows.

CORAH, or **CORAH-JEHENEHAD**, a city of Hindostan Proper, in the territory of Doab, 60 miles S. S. W. of Lucknow.

CORAL. See **CORALLINA**. There are properly but three kinds of coral; red, white, and black: the black is the rarest, and most esteemed. The red was formerly used in medicine, but is now scarce ever prescribed by any intelligent practitioner, having no virtues superior to the common testacea. When coral is newly taken up out of the sea, the small protuberances on its surface are soft, and yield, on being pressed, a milky juice which effervesces with acids. The cortical part with which the coral is all over covered, is not near so compact as the internal, and may easily be taken off whilst fresh; and from this part it is usually freed before it comes to the market. The greatest coral trade is in Genoa and Leghorn. Coral is often imitated by artificial compositions, some of which are made to resemble it exactly; but the fraud may be discovered by fire, the counterfeit not affording alkaline earth like the genuine coral. The colouring ingredients in the artificial coral are cinnabar and minium, which are easily discovered. The natural coral seems to receive its colour with iron; for spirit of vitriol acquires from it a ferruginous taste; and on calcining the coral, some particles are found among the ashes that are attracted by the magnet. According to Neumann, 16 oz. of coral, distilled in an open fire, yield about 6 $\frac{1}{2}$ scruples of volatile alkaline spirit, with two or three grains of an empyreumatic oil: from the caput mortuum calcined, 5 $\frac{1}{2}$ scruples of fixed salt may be extracted.

CORAL FISHERY. Red coral is found in the Mediterranean, on the coast of the late Provence, from Cape de la Couronne to that of St. Tropez; about the isles of Majorca and Minorca: on the S. of Sicily; on the coasts of Africa; and in the Ethiopic ocean, about cape Negro. The divers say, that the little branches are found only in the caverns whose situation is parallel to the earth's surface, and open to the south. The manner of fishing is nearly the same wherever coral is found. The method used at the bastion of France, under the direction of the company established at Marseilles, is to send out seven or eight men in a boat, and when the net is thrown by the castor, the rest work the vessel, and help to draw the net in. The net is composed of two rafters of wood tied cross-wise, with leads fixed to them: to these they fasten a quantity of hemp twisted loosely round, and intermingled with some large netting. This instrument is let down where they think there is coral, and pulled up again when the coral is strongly intangled in the hemp and netting. For this purpose, six boats are sometimes required; and if in hauling in, the rope happens to break, the fishermen run the hazard of being lost.

CORALLINA, or **CORAL**, in zoology, a genus belonging to the order of vermes zoophyta. The trunk is radicated, jointed, and calcareous. The species are 8, distinguished by the form of their branches, and are found in the ocean, adhering to stones, bones, shells, &c. The corals were formerly believed to be vegetable substances hardened by the air; but are now known to be composed of congeries of animals, which are even endowed with the faculty of moving spontaneously. The islands in the South Sea are mostly coral rocks covered over with earth. The little creatures, which have scarce sensation enough to distinguish them from plants, build up a rocky structure from the bottom of that sea, too deep to be measured by human art, till it reaches the surface. Some of these coralline islands appear to be of a much older date than others; particularly the Friendly Islands: and it is probable that as these submarine works are still going on, new islands may by that means frequently be produced. M. De Pyssonnel of Marseilles, in consequence of a series of experiments, from 1720 to 1750, seems to have been the first who threw a proper light upon

upon the nature and production of coral and similar marine substances. Those bodies, which the count de Marsigli imagined to be flowers, this ingenious naturalist discovered to be insects inhabiting the coral; for upon taking branches of it out of the water, the flowers, which proceeded from a number of white points answering to the holes that pierced the bark, and the radiation of which resembled the flower of the olive-tree, entered into the bark and disappeared; but upon being again restored to the water, they were some hours after perceptible. These flowers spread on white paper lost their transparency, and became red as they dried. The holes in the bark corresponded to small cavities upon the substance of the coral; and when the bark is removed, there may be seen an infinite quantity of little tubes connecting the bark with the inner substance, besides a great number of small glands adhering to them; and from these tubes and glands the milky juice of coral issues forth: the holes in the bark are the openings through which the insects that form the substances for their habitation come forth; and those cavities which are partly in the bark, and partly in the substance, are the cells which they inhabit. The organs of the animal are contained in the tubes, and the glandules are the extremities of its feet, and the milky liquor is the blood and juice of the animal, which are more or less abundant in proportion to its health and vigour. When the insects are dead, they corrupt, and communicate to the water the smell of putrid fish. This juice or liquor runs along the furrows perceived upon the proper substance or body of coral, and stopping by little and little becomes fixed and hard, and is changed into stone; and being stopped in the bark, causes the coral to increase proportionably, and in every direction. In forming coral, and other marine productions of this class, the animal labours like those of the testaceous kind, each according to his species; and their productions vary according to their several forms, magnitudes, and colours. The coral insect, or polype, M. Peyssonnel observes, expands itself in water, and contracts itself in air, or when it is touched with the hand in water, or acid liquors are poured upon it: and he actually saw these insects move their claws or legs, and expand themselves, when the sea-water containing coral was placed near the fire, and keep them in their expanded state when separated from the coral in boiling water. Broken branches of coral have been observed to fasten themselves to their branches, and have continued to grow; and this is the case when they are connected with detached pieces of rock and other substances, from which no nourishment could be derived. The coral insects in their cells, not having been injured, continue their operations; and as they draw no nourishment from the stone of the coral, they are able to increase in a detached and separate state.

CORALLINES, in natural history, were formerly reckoned a genus of plants, and Mr. Tournefort enumerates 36 species of them; but in the Linnæan system they belong to the class of the zoophytes. They are defined by modern naturalists, submarine plant-like bodies, that consist of many slender finely divided and jointed branches, resembling some species of moss; or animals growing in the form of plants, having their stems fixed to other bodies. These stems are composed of capillary tubes, whose extremities pass through a calcareous crust, and open into pores on the surface. The branches are often jointed, and always subdivided into smaller branches, which are either loose and unconnected, or joined as if they were glued together. They are distinguished from plants by their texture and hardness: they also yield in distillation a considerable quantity of volatile salt; and their smell, in burning, resembles that of burnt horns and other animal substances. Many of the corallines seem to consist of a single tube, containing a single parent animal. Every branch emitted contains an offspring of this parent dependent upon it, and yet capable of producing its like in the emission of a new branch. Others consist of many such tubes united, rising up together, and encircling the deserted tubes of their progenitors, whose exuvie become the substratum of a rising generation. The common coralline is only used in medicine, as a vermifuge. It is given in powder, from 10 grains to a scruple or half a dram, twice a day. Mr. Ellis distributes corallines into four kinds; viz.

1. CORALLINES, ARTICULATED, consisting of short pieces of a stony or cretaceous brittle matter, whose surface is covered with pores or cells, which are joined by a tough, membranous, flexible substance, composed of many small tubes of the like nature com-

pacted together. The stony part is soluble in vinegar, and the other parts remain entire. Fig. 1, Plate LII. represents the coralline of the shops; and fig. 2, a branch of it magnified. It is fixed to rocks and shells by stony joints, which, as they rise, are united to others by extremely fine and slender tubes: these may be discovered by a good eye, or a common magnifier. As the stems extend themselves, they become pennated by side-branches which come out opposite to each other, and are jointed in the same manner; the joints of this species are like the upper part of an inverted cone, but a little compressed: the whole surface is covered over with very minute circular-shaped cells like pores: see fig. 3, and 4, where they are higher magnified. Fig. 5, shews a cross section highly magnified. If a branch of this coralline is put into vinegar, these cells are dissolved with the whole cretaceous surface; instead of which there appear rows of minute ramifications, which seem to have communicated with each of these cells. Upon some specimens of this coralline, are seen small figures like seed-vessels, with which the branches frequently terminate. We frequently find these corallines of different colours, as red, green, ash, and white; but all of them, when exposed to the sun and air on the shore, become white.

2. CORALLINES, CELLIFEROUS, those which appear, when magnified, to be fine thin cells, the habitations of small animals connected together, and disposed in a variety of elegant forms like branches. These effervesce with acids. See fig. 6; with parts magnified, fig. 7, 8, and 9.

3. CORALLINES, TUBULAR, are composed of a number of simple tubes, growing up nearly together; or of such branched ones as have neither denticles nor vesicles. These are horny and elastic, and recover their original form in water. Some of them appear wrinkled like the wind-pipe, and others like the intestines of small animals. See fig. 10.

4. CORALLINES, VESICULATED, are distinguished by their horny hollow ramifications; most of them are furnished with little denticles on their branches, like leaves and mosses; and at certain seasons of the year they have small bodies like bladders proceeding from their stems and branches, and differing in form according to the different species. Their colour, when dry, is of a yellowish or pale brown, and their nature is elastic. They are found adhering to rocks, shells, and fucuses, by small root-like tubes: they recover their form in water, after having been dried; and when put into vinegar, they cause no effervescence. Fig. 11, represents the sea tamarisk in its natural size, and fig. 12, the denticles magnified; fig. 13, the sea-cypress; fig. 14, a part magnified; and fig. 15, and 16, the small climbing coralline, with well-shaped cups. Besides the above, Mr. Ellis enumerates other genera of marine productions; as the keratophyta eschara, fig. 17, sponges, and alyconium; all which are the nests or matrices of sea-animals. This class of marine bodies is formed like fungi of various figures, and with different sorts of covering; some consisting of a spongy, and others of a fleshy substance; the skin being in some gritty, and in others callous; and fig. 19, 20, are views of one of the warts magnified; fig. 21, is the appearance of the polype, when the cretaceous matter was dissolved: fig. 22, represents the particles that compose the incrustation, magnified; fig. 18, is a sea-willow, or keratophyton dichotomum.

CORAL RIVER, a river in New Mexico, which falls into the gulf of California.

CORAL-STONE, a kind of red and white agate, found in Italy and some parts of Saxony, which breaks in veins.

CORANICH, among the Scotch and Irish, the custom of singing at funerals, anciently prevalent in those countries, and still practised in several parts. See ULOGHONE.

CORBACH, a town of Germany, in the circle of the Upper Rhine, 12 miles N. N. W. of Waldeck.

CORBAN, [קרבן] an alms-basket; a receptacle of charity; a gift; an alms.

CORBAN, in Jewish antiquity, stands for an offering or gift made to God, or his temple. The Jews sometimes swore by corban, or the gifts offered unto God. If a man made all his fortune corban, or devoted it to God, he was forbidden to use it. If all that he was to give his wife, or his father and mother, was declared corban, he was no longer permitted to allow them necessary subsistence. Even debtors were permitted to defraud their creditors, by consecrating their debt to God. Our Saviour reproaches the Jews, in

the Gospel, with these uncharitable and irreligious vows. By this word such persons were likewise meant as devoted themselves to the service of God and his temple. Corban signifies also the treasury of the temple, where the offerings, which were made in money, were deposited.

CORBAN was also applied to those offerings which had life, in opposition to the minchah, or those which had not. It is derived from the word *karab*, which signifies to approach; because the victims were brought to the door of the tabernacle.

CORBAN is likewise a ceremony which the Mohammedans perform at the foot of mount Ararat in Arabia, near Mecca. It consists in killing a great number of sheep, and distributing them among the poor.

CORBECK, a town of France, in the department of Dyle, three miles S. of Louvain.

CORBEIL, a town of France, in the department of Seine and Oise, 17 miles S. of Paris.

CORBEILS, in fortification, little baskets about a foot and a half high, eight inches wide at the bottom, and twelve at the top; which being filled with earth, are frequently set one against another upon the parapet, or elsewhere, leaving certain port-holes, whence to fire upon the enemy under covert, without being seen by them.

CORBEL, in architecture, the representation of a basket, sometimes seen on the heads of caryatides. The word is also used, in building, for a short piece of timber placed in a wall, with its end sticking out six or eight inches, as occasion serves, in manner of a shouldering-piece.

CORBELIN, a town of France in the department of Isere, 30 miles E. S. E. of Lyons.

CORBENY, a town of France, in the department of Aisne, 15 miles N. N. W. of Rheims.

CORBEY, or CORBIE, a town of France, in the department of Somme, 10 miles E. of Amiens.

CORBIERES, a town of the Helvetic republic, in the Canton of Friburg; 10 miles S. of Friburg.

CORBY, a town of Germany, on the confines of Westphalia, with a famous abbey, 36 miles E. of Paderborn.

CORCAS, an island in the Atlantic, N. of St. Domingo, resembling a crescent in form. Lon. 70. 55. W. Lat. 21. 55. N.

CORCHORUS, in botany, a genus of the monogynia order, and polyandria class of plants; natural order, Columnææ. Corolla pentapetalous, calyx pentaphyllous, deciduous; capsule many-valved, many-celled. It has sixteen species, natives of both the Indies.

CORCULUM, in botany, a term used by Linnæus for the heart, or more properly embryo, of a seed, alluding to its shape, which in the walnut, and many other seeds, resembles the animal heart in miniature. It is the most important, and even essential part of a perfect seed, to which all the rest are subservient, being the point whence the future plant originates. In unimpregnated seeds it is deficient, or rather abortive; in fertile ones it is closely connected with the cotyledons, on which it depends for the first supplies of nutriment, and other exciting causes of its evolution. The corculum consists of the radicle, which descends to become a root, and the plumula or feather which ascends and becomes the stem and leaves.

CORCYRA, in ancient geography, an island in the Ionian sea, opposite to Thesprotia, a district of Epirus, called Scheria and Phæacia by Homer. It is now called Corfu.

CORCYRA, a town in the above island, now Corfu, from the *Korvufu* of the middle age, the name of the citadel. It was a colony of Corinthians.

CORCYRA NIGRA, an island in the Adriatic, on the coast of Dalmatia; now Curzola.

CORD, or CHORD. See CORDAGE. The word comes from the Greek *χορδή*, which properly signifies an intestine or gut, of which cords may be made.

CORD, MAGICAL, an instrument in great use among the Laplanders, and by them supposed to be endued with a number of virtues. It is a cord or rope with three knots tied in it. They use many magical rites and ceremonies in the tying of this cord; and, when thus prepared, it is supposed to have power over the winds; and they will sell, by means of it, a good wind, or at least the promise of one, to a ship. If they untie only one of these

knots, a moderate gale succeeds; if two, it is much stronger; and if three, a storm is sure to follow.

CORD OF WOOD, a certain quantity of wood for burning, so called because formerly measured with a cord. The dimensions of a statute cord of wood are eight feet long, four feet high, and four feet broad.

CORDAGE, a term used, in general, for all sorts of cord, whether small, middling, or great, made use of in the rigging of ships.

CORDAGE, CABLE-LAID, as the seamen term it, is made with nine strands, *i. e.* the first three strands are laid slack, and then three of them being closed together, make a cable. See CABLE. The same for tacks, but they are laid tapering.

CORDAGE, HAWSER-LAID, is made only with three strands. Cordage-stays are cable-laid, but made with four strands, as cables are with three; with the addition of a heart, which goes through the centre of them.

CORDAGE, WHITE, is that which has not yet been tarred.

CORDAGE, TARRED, in spinning is that which is made of rope-yarn ready tarred.

CORDAGE, TARRED IN THE STOVE, is that which has passed through hot tar, in coming out of the stove. Every quintal of cordage may take about twenty pounds of tar. Cordage re-made is that which is made of ropes used before. Cordage, when very old, is used for oakum to caulk the seams of ships. When a rope is said to be six inches it is understood of its circumference. A rope of sixty threads is one composed of so many rope-yarns. The naval cordage of the earlier ages was in all probability only thongs of leather. These primitive ropes were retained by the Caledonians in the 3d century. The nations N. of the Baltic had them in the 9th or 10th centuries: and the inhabitants of the western isles of Scotland still use them; cutting the skin of a seal, or the raw and salted hide of a cow, into long pieces, and fastening the plough to their horses with them, or even twisting them into strong ropes of 20 or 30 fathoms in length. But these, in the south of our island, and on the continent, were early superseded by the use of iron chains. The Veneti, who were so intimately connected with the Belgæ of Britain, used iron chains for their cables in the days of Cæsar. But in the more refined countries of the south, both thongs and these had long given place to vegetable threads. The Greeks appear to have used the common rushes of their country, and the Carthaginians the spartium or broom of Spain. And as all the cordage of the Romans was made of these materials at their last descent on our island, so the art of manufacturing them would necessarily be introduced with the Roman settlements among the Britons. Under the direction of Roman artists their thongs of leather would naturally be laid aside, and the junci, or rushes of the plains, worked up into cordage. And what remarkably coincides with this opinion is, that the remains of old cables and ropes are still distinguished among the British sailors by the name of old junk. The Roman sails, which were composed of flax in the days of Agricola, were afterwards made of hemp; and our own are therefore denominated cannabis or canvas by our mariners at present. And doubtless about the same period did the junk of the British cordage give way to the same materials; the use of hempen ropes upon land, and of hempen nets for hunting, being very common among the Romans in the first century. See ROPE-MAKING.

CORDEAU, [Fr.] a measuring line used for marking out the ground for a camp or fortification.

CORDED, in heraldry, a cross corded: some authors take it for a cross wound or wrenched about with cords; others, with more probability, take it for a cross made of two pieces of cord.

• CORDILLERAS, mountains of South America, otherwise called Andes.

CORDELIER, in church history, a Franciscan, or religious of the order of St. Francis. The cordeliers are enjoined to live in common: those who are admitted into the order, are first to sell all they have and give it to the poor. The priests are to fast from the feast of All Saints till the Nativity.

CORDES, two towns of France, viz. 1. in the department of Tarn, 10 miles N. of Gaillac. 2. In that of Upper Garonne, 20 miles N. W. of Thoulouse.

CORDIA, in botany, a genus of the monogynia order, and pentandria class of plants; natural order, Asperifolia. Corolla, funnel-

funnel-shaped; style dichotomous or divided into two threads, and each of these divided into other two. It has twelve species.

C. MYXA, the **ASSYRIAN PLUM**, is a native of Assyria, Egypt, and the coast of Malabar. The leaves of this tree are about three inches long, opposite, flat, entire, on a round petiole half an inch in length; peduncles paniced, terminating, subcorymbed; petals white, revolute; fruit inferior, red, nearly an inch in diameter. The timber of this tree is tough and solid; it is used for procuring fire by friction.

CORDIAL, [from *cor*, the heart, Lat.] reviving, invigorating, restorative.

CORDIALS. See **CARDIAC**.

CORDIAL, in medicine, whatever raises the spirits, and gives them a sudden strength and cheerfulness. See **MEDICINE**.

CORDON, in fortification, a row of stones, made round on the outside, and set between the wall of the fortress, which lies aslope, and the parapet which stands perpendicular, after such a manner, that this difference may not be offensive to the eye: whence the cordons serve only as an ornament, ranging round about the place, being only used in fortification of stone-work. For in those made with earth, the void space is filled up with pointed stakes.

CORDONNIERS, FRERES, [Fr. *i. e.* Brothers, Shoemakers,] the title of two pious societies, which existed in Paris before the revolution. They were established by authority about the middle of the 17th century; the one under the protection of St. Crispin, the other of St. Crispianus, two saints who had formerly honoured the profession. They lived in community, and under fixed statutes and officers; by which they were directed both in their spiritual and secular concerns.

CORDOVA, a province of Spain, in Andalusia, and formerly an independent kingdom.

CORDOVA, or **CORDOUA**, the capital of the above province, anciently called Corduba, and seated on the Guadalquivir, 75 miles N. E. of Seville. Lon. 4. 4. W. Lat. 37. 52. N.

CORDOVA, a province of South America in the government of Buenos Ayres.

CORDOVA, a city of Peru, in S. America, in the jurisdiction of Charcas, 80 leagues S. of St. Jago. From indisputable evidence, a negress, in this city, named Louisa Truxo, was alive in 1774, aged one hundred and seventy-five years! Lon. 63. 30. W. Lat. 32. 30. S.

CORDWAINER, [from *Cordovan*, Spanish leather,] a term whereby shoemakers are denominated in statutes. By a statute of Jac. I. the master and wardens of the cordwainers company, &c. are to appoint searchers and triers of leather; and no leather is to be sold, before searched, sealed, &c.

CORDWAINERS, or **CORDINERS**, is still the title of the incorporation of shoe-makers in Edinburgh. The French workmen who prepare the corduas are still called *corduanniers*.

CORDYLOCARPUS, in botany, a genus of the tetrady-namia siliquosa class and order. Silique cylindrical, swelling into knobs, jointed, the uppermost joint distinct; calyx closed. Two species, natives of the Archipelago.

CORE, a sound in N. Carolina, lying S. of Pimlico, with which it communicates.

COREA, a peninsula lying N. E. of China, between 99 and 109 degrees of E. Lon. and between 32 and 46 of N. Lat. It is divided into 8 provinces, which contain 40 cities of the 1st rank, 51 of the 2d, and 70 of the 3d. The capital is Hanching, where the king resides. Corea chiefly produces wheat, rice, and ginseng, with a kind of palm-tree which yields a gum capable of producing a yellow varnish little inferior to gilding. Hence also are exported castor and sable skins; also gold, silver, iron, and fossil salt; a kind of small brushes for painting, made of the hair of a wolf's tail, are likewise manufactured here, which are exported to China, and highly esteemed there. The sea-coasts abound in fish, and very great numbers of whales are found there year towards the N. E.

COREIA, in antiquity, a festival in honour of Proserpine, named *Core*, *Kógr*, which in the Molossian dialect signifies a beautiful woman.

CORELLI, **ARCHANGELO**, a famous Italian musician and composer, born at Fusignano, in Bologna, in 1633. He entertained an early propensity to the violin. About 1672, his curiosity led him to visit Paris, but notwithstanding the character which he

brought with him, he was driven back to Rome by Lully, whose jealous temper could not brook so formidable a rival. In 1680 he visited Germany, and met with a reception suitable to his merit from most of the German princes, particularly the elector of Bavaria; in whose service he was retained, and continued for some time. After about five years stay abroad, he returned to Rome. His proficiency on the violin was so great, that his fame soon spread throughout Europe. The style of his performance was learned, elegant, and pathetic; and his tone firm and even. Mr. Geminiani, who was well acquainted with it, used to resemble it to a sweet trumpet. It is said, that, whilst he was playing on the violin, it was usual for his countenance to be distorted, his eyes to become as red as fire, and his eye-balls to roll as in an agony. Corelli was highly favoured by that great patron of poetry and music, cardinal Ottoboni; and regulated the musical academy held at his palace. Here Mr. Handel became acquainted with him; and a serenata of Handel's entitled, *Il Triomfo del Tempo*, being performed, the overture was in a style so new and singular, that Corelli was confounded in his first attempt to play it. While Corelli resided at Rome, many persons from other countries were ambitious of becoming his disciples. Of these it is said the late lord Edgcombe was one. Corelli died at Rome in 1713; and was buried in the church of the Rotunda. A monument with a marble bust was erected to his memory by Philip William, count palatine of the Rhine, under the direction of cardinal Ottoboni. For many years after his death, he was commemorated by a solemn musical performance in the Pantheon; where some of his concertos were performed by those who had been his pupils, in the same slow, distinct, and firm manner, without graces, in which they were played by the author himself. He was a passionate admirer of pictures, and lived in an uninterrupted friendship with Cignani and Carlo Marat; who presented him at times with pictures, both of their own painting and by other masters: whereby he became possessed of a valuable collection of original paintings; all which, together with about 6000*l.* sterling, he left to his friend Ottoboni; who, reserving the pictures to himself, generously distributed the rest among the relations of the testator. Corelli was remarkable for the mildness of his temper, and the modesty of his deportment; though not insensible of the respect due to his skill and exquisite performance. His compositions are equally celebrated for the harmony resulting from the union of all the parts, and for the fineness of the airs. His music is the language of nature, and, for a series of years, all that heard it were sensible of its effects. Amidst all the innovations which the love of change had introduced, it continued to be performed, and was heard with delight in churches, in theatres, at public solemnities and festivals, in all the cities of Europe for near 40 years. And even at this day, the masters of the science allow that, of fine harmony and elegant modulation, the most perfect exemplars are the compositions of Corelli.

COREOPSIS, TICK-SEEDED SUNFLOWER; a genus of the polygamia frustranea order, and syngenesia class of plants; natural order, Compositæ. Receptacle paleaceous; pappus two-horned; calyx erect, polyphyllous, surrounded with patent radiated leaflets at the base. Twenty species, most of them herbaceous perennials.

CORFE CASTLE, a town in Dorsetshire, so named from a strong castle, now in ruins. It is 21 miles E. of Dorchester, and 120 W. by S. of London. This town was built by king Edgar, and was the scene of the murder of Edward the martyr.

CORFU, an island in the Ionian sea, at the mouth of the gulph of Venice, formerly called *Coreyra* and *Phæacia*, famous for the gardens of Alcinoüs. It was long considered as the bulwark of Christendom against the Turks, who often attempted to reduce it, but in vain. It is well fortified, having 50 castles; and the number of the inhabitants is said to be about 50,000, who are of the Greek church. The soil is very fruitful, and produces a great deal of wine, olives, and other fruits, particularly excellent figs.

CORFU, the capital of the above island. It is four miles in circumference, and is seated on the E. coast. Lon. 19. 48. E. Lat. 39. 40. N.

CORGA, a country of India on the coast of Malabar, bounded on the N. and E. by Mysore.

CORIA, a town of Spain, in the kingdom of Leon, and province of Estremadura.

CORIA, a town of Spain, in the province of Seville, on the Guadalquivir, seven miles from Seville.

CORIANDRUM, CORIANDER: a genus of the digynia order, and pentandria class of plants; natural order, Umbellatæ. Corolla radiated; petals inflexed, emarginated; involucre universal monophyllous; partial involucre halved; fruit spherical. There are two species, both herbaceous annuals, the leaves of which are useful for the kitchen, and the seeds for medicine. Both species have divided small leaves, somewhat resembling parsley.

CORIARIA, the TANNER'S, or MYRTLE-LEAFED SUMACH: a genus of the decandria order, and diœcia class of plants; natural order, Miscellanæ. Male calyx pentaphyllous; corolla pentapetalous, very like the calyx, and united with it; antheræ bipartite; female calyx pentaphyllous; corolla like that of the male; styles five; seeds five, covered with five succulent petals, forming altogether the resemblance of a berry. It has three species.

CORIDOR, [Ital. and Span.] in architecture, a gallery or long isle around a building, leading to several chambers at a distance from each other, sometimes wholly inclosed, and sometimes open on one side.

CORIDOR, or CORRIDOR, in fortification, a road or way along the edge of the ditch, without side, about twenty yards broad, encompassing the whole fortification. It is also called the covert way; because covered with a glacis, or esplanade, serving it as a parapet.

CORIENTES, a cape of Mexico, or New Spain, on the N. Pacific ocean.

CORIENTES, a small city of S. America, in the government of Buenos Ayres, at the confluence of the Parana and Paraguay.

CORINNA, a celebrated Theban poetess, who is said to have gained the prize in competition with Pindar himself, five different times. She flourished about B. C. 450, and wrote 50 books of Epigrams.

CORINTH, a celebrated city of antiquity, for some time the most illustrious of all the Greek cities. It is said to have been founded 1514 years before Christ, by Sisyphus the son of Æolus, and Grandfather of Ulysses. Various reasons are given for its name, but most authors derive it from Corinthus, the son of Pelops. It was situated in the S. part of the Isthmus which joins the Peloponnesus to the continent. Lon. 23. 3. E. Lat 38. 14. N. As the genius of the Corinthians led them to commerce rather than martial exploits, their city became the finest in all Greece. It was adorned with the most sumptuous buildings, as temples, palaces, theatres, porticoes, &c. all enriched with a beautiful kind of columns, which from the city were called Corinthian.

CORINTH, THE ISTHMUS OF, is a neck of land in the Morea, which joins the Morea to Greece; and reaches from the gulph of Lepanto to that of Egina.

CORINTHIAN ORDER, is generally reckoned the fourth, but by some the fifth, of the five orders of architecture; and is the most noble, rich, and delicate, of them all. Vitruvius ascribes it to Callimachus, a Corinthian sculptor, who is said to have taken the hint by passing by the tomb of a young lady, over which a basket with some of her playthings had been placed by her nurse, and covered with a tile; the whole having been placed over a root of acanthus. As it sprung up, the branches encompassed the basket; but arriving at the tile, bent downwards under the corners of it, forming a kind of volute. Hence Callimachus imitated the basket by the vase of his capital, the tile in the abacus, and the leaves in the volute. Villalpandus imagines the Corinthian capital to have taken its original from an order in the temple of Solomon, whose leaves were those of the palm-tree. The capital is adorned with two rows of leaves, between which little stalks arise, of which the 16 volutes are formed, which support the abacus. See ARCHITECTURE.

CORINTHIANS, the people of Corinth. Christianity was early planted among them, and St. Paul wrote them three letters, the first of which is lost. See 1 Cor. v. 9.

CORIS, in botany, a genus of the monogynia order, and pentandria class of plants. Corolla monopetalous, irregular; calyx prickly; capsule quinquevalved, superior. There is only one species, viz. the

C. Monspelienensis, or blue maritime coris of Montpellier.

CORISPERMUM, TICKSEED, a genus of the digynia order, and monandria class of plants: natural order, Holoracæ. No calyx; petals two; seed one, oval, naked. There are two species; neither of them remarkable for beauty or any other quality. Natives of Russia.

CORITANI, an ancient people of Britain who possessed the

inland parts now called Northampton, Leicester, Rutland, Lincoln, Nottingham, and Derby shires.

CORK, a county of Ireland, in the province of Munster; containing near a million of acres, and divided into 15 baronies. It is bounded on the N. E. by the county of Waterford. Next to Dublin, it is the most populous county in the kingdom.

CORK, a city of Ireland, and capital of the county. It is an episcopal see; and is the second in the kingdom, in point of size, trade, and population. The harbour called the Cove, seven miles below the town, is one of the best in the world, the entrance is safe, and the whole navy of England might ride in it, secure from every wind that blows. Ships of burden, however, are obliged to unload at Passage, $5\frac{1}{2}$ miles from Cork, the channel not admitting vessels of above 150 tons. Cork lies 50 miles S. of Limerick. Lon. 8. 23. W. Lat. 51. 54. N.

CORK, [cortex, Latin; korck, Dutch,] is the bark of a species of quercus. See QUERCUS. To take off the bark an incision is made from the top to the bottom of the tree, and at each extremity another round the tree, perpendicular to the first. When stripped from the tree, which does not therefore die, the bark is piled up in a pond or ditch, and loaded with heavy stones to flatten it, and reduce it into tables: hence it is taken to be dried; and when sufficiently dry, put in bales for carriage. If care be not taken to strip the bark, it splits and peels off itself; being pushed up by another bark formed underneath. The bark of cork, as well as the acorn, are of some use in medicine; being both reputed astringents, after being burnt and powdered when used externally; but the chief use of the former is, to put in shoes, slippers, &c. and to stop bottles. The Spaniards burn it to make that kind of light black we call Spanish black, used by painters. Cups made of cork, are said by some to be good for hectic persons to drink out of. The Egyptians made coffins of cork; which being lined with a resinous composition, preserved dead bodies uncorrupted. The Spaniards line stone walls with it, which not only renders them very warm, but corrects the moisture of the air.

CORK-WAISTCOAT, in the Gentleman's Magazine for 1758, we met with the following curious contrivance of a cork-waistcoat, for the purpose of preventing accidents by drowning. It was invented by Mr. Dubourg, and is composed of four pieces of cork, two for the breasts, and two for the back, each being nearly of the same length and breadth as the quarters of a common waistcoat, without flaps; the whole is covered with coarse canvas, having two holes to put the arms through. There are spaces left between the two back pieces and each back and breast piece, that they may the more easily be adjusted to the body. Thus, the waistcoat is open only in front, and may be fastened on the wearer with strings; or, if it should be thought more secure, with buckles and leather straps. The weight of this cork-waistcoat does not exceed twelve ounces, and may be made at a very moderate expence. It is more simple in its form than any other contrivance for a similar purpose. Mr. Dubourg has made trial of its efficacy in the Thames, and found that it not only supported him on the water, but that even two men, with their utmost efforts, were not able to sink him. Hence it is eminently calculated for mariners, passengers at sea in general, and likewise for all those who resort to bathing-places for the benefit of their health; as the most timorous and delicate person may, with perfect safety, boldly venture with one of these waistcoats into a rough sea. See BAMBOO-HABIT.

CORLIN, or CORLING, a town of Germany, in Pomerania, eight miles S. E. of Colberg.

CORMANTIN, GREAT, a town of Africa, on the Gold Coast, in the territory of Fantin. It contains about 1200 men, who are either traders or fishermen.

CORMANTIN, LITTLE, a town on the Gold Coast, four miles W. S. W. of Great Cormantin.

CORMERY, a town of France, in the department of Indre and Loire, eight miles S. E. of Tours.

CORN, [corn, Sax. korn, Germ.] in rural economy, the grains or seeds of plants, which are separated from the ear, and used chiefly for making bread. There are several species of corn, such as wheat, rye, barley, oats, millet, and rice, maize, or Indian corn, &c. each of which will be mentioned in its alphabetical order. We cannot but animadvert upon the injudicious practice of cutting corn in cold autumns, before it is perfectly ripe; as experience has proved, that, if left standing, the ears will continue to fill, and become heavier, even during the autumnal frosts. Were this lat-

ter method adopted, a much greater proportion of flour might be produced; and the grain would neither shrink, nor shrivel, in barns or granaries: it might, at the same time, be prevented from rotting, on account of its immaturity, and the softness or moisture which are the necessary consequence. Notwithstanding the great care and attention which the husbandman may bestow on the cultivation of corn, his expectations of a plentiful harvest are often frustrated by a variety of disorders, and accidents, to which corn is peculiarly liable. The first and most formidable is the smut, which is caused by vermin breeding in the grain, and thus destroying its substance. Their propagation, beside other causes, is evidently facilitated by laying on the soil too large a quantity of crude dung: which, becoming mouldy, promotes the generation of the smut-animal. Various experiments have been accordingly tried, to eradicate this noxious distemper, with different degrees of success; a few of which, we shall enumerate. In the greater part of the counties of Devon and Cornwall, on the evening before the wheat is intended to be sown, it is laid on the floor in a heap, on which is poured a solution of lime, slacked with boiling water, and reduced to the consistence of cream: both are then mixed, and left together till morning, by which time the wheat is dry, and fit to be sown. In other parts of the same counties, the wheat is steeped either in fresh or salt water, for 12, 18, or 24 hours, when it is put to drain for an hour or two, after which, powdered lime is sifted over it, the whole being well mixed with a shovel: it is then thrown together in a heap, to dry previously to its being sown. Few farmers, however, soak it in brine, and a still smaller number of them, substitute animal urine, soap-boiler's lye, &c. In several other counties, there prevails a general practice of employing brine, strong enough to bear an egg, to which powdered lime is added, till it acquires an unctuous consistence. This composition is mixed with the wheat, the evening before it is committed to the ground. In Yorkshire, and several of the adjoining counties, arsenic is substituted for salt: some farmers render the solution thicker, by the addition of lime, while others either sprinkle the wheat with it, or steep and wash the former, then sift the lime over it, and mix them as before. Another method is, to put 70 gallons of water into a tub, at the bottom of which is a hole provided with a staff and tap hose, as in brewing; to this is to be added half a hundred weight of lime-stone, and the whole well stirred for half an hour, when it is suffered to stand about 30 hours. It should then be drawn off into another tub, and three pecks (42lbs.) of salt added, which, when dissolved, will make a strong pickle, fit for immediate use. But, if sea-water can be procured, half the quantity of salt will be sufficient. A basket of about two feet in diameter at the bottom, and twenty inches deep, should then be placed in the pickle, and the corn gradually immersed, in small quantities from one to two bushels; care being taken to skim off the light grains, which ought not to be sown, because many of them are infected with the smut. As soon as this operation is completed, the basket should be drawn up, and drained for a few minutes over the liquor, when it may be repeated, as often as the quantity of grain to be sown may require. This seed will be fit for the ground in 24 hours; but, where it is to be drilled, it should stand for 48: and, if the driller meet with any difficulty in performing his work, it will be necessary to make the pickle more astringent, by adding lime. Seed, thus prepared, may be kept for five, six, seven, eight, or even ten days above ground, without any injury or inconvenience. Another mode of preventing the smut in corn, was discovered by Mr. R. Treffrey, of Beer, in Flintshire: who, in a communication to Mr. Young, in the 21st vol. of "Annals of Agriculture," states, that having rubbed out a quantity of corn, he sowed part of it, unwashed. The remainder, about two bushels, was well winnowed, taken to a brook, and washed in the following manner: A gallon was put into a wire sieve, that had eight bars to an inch; it was first gently immersed a few times in the water, by which means every smut-ball, or animal, was easily discovered, and taken away; next the sieve was briskly agitated, for about a minute, when the whole, after being washed, and thrown into a tub with some water, was stirred round with a broom. It was then again put into the sieve, in the same proportion as before, and immersed in the brook, that the remaining particles might sink through the bottom of the sieve, and be carried away by the stream. This wheat was sown in the same field with the former, where no kind of manure could have the least tendency to produce smut-balls among either. The result at harvest proved, that

the unwashed corn produced as many smut-balls as grains of wheat, while that which had been immersed in the brook, was almost entirely exempt from the disorder. We venture to recommend the last-mentioned expedient; for the superiority of gradual washing over that of throwing the whole into a vessel and stirring it, is manifest. By this method, the infectious matter is not only loosened from the grains, but is carried away with the stream, while that, which is only washed in a tub, &c. cannot be totally cleared; for the more ponderous particles sink to the bottom, and remain among the seed-corn after the water is poured off. Corn is also liable to be grown, or sprouted, when it has partly begun to vegetate; for, if the whole of the grain were to bud, it would become unfit for being converted into bread. Hence it is very difficult to preserve sprouted corn, as the opening of the bud occasions it to heat, and the moisture it retains, disposes it still more to undergo the process of fermentation. It is also more subject to be attacked by insects, on account of its being sweeter, more tender, and susceptible of heat, consequently more liable to receive their eggs. If left to itself, sprouted corn heats, ferments, and contracts an unpleasant smell, and a bad colour: it also acquires a disagreeably sharp taste, which is communicated to the flour and bread; and, finally, grows mouldy and sour; in this state, it is fit only for the manufacture of starch. Farther, it is ground with difficulty, clogs the mill-stones, chokes the bolting-cloths, and yields but little flour; which is soft and moist, and will not keep for any length of time, especially during warm weather. Sprouted corn should by no means be stacked, but housed and threshed with the greatest expedition. Nor should it be put in a granary together with dry grain, as the latter will thus become moist. Care should also be taken to keep the place well aired; for, in the contrary case, even the latter cannot be preserved. As soon as sprouted corn is threshed, it should be spread upon the floor, and frequently turned; a door, or window, being left open to give vent to the steam. Sometimes it will be necessary to dry the corn in an oven, after the bread is removed; leaving the door half open, and turning the grain every ten minutes, to facilitate the evaporation of the moisture. When it is thus dried, it should be sifted, and not put into sacks, or in heaps, till it is properly cooled; as it will otherwise become mouldy. Although some fastidious persons may object to the trouble occasioned by this mode of curing sprouted corn, yet as eight or ten days continual drying will preserve it for a whole year, and render both the bread and flour of a better quality, it surely merits the attention of every diligent husbandman, and will amply compensate his trouble and labour. There is another disease that frequently attacks corn, which is usually termed burnt grain, which is like the smut, and is to be treated in a similar manner. To these may be added, what is called the spur, which affects both wheat and rye, but more especially the latter. The grains infested with it, are thicker and longer than the sound ones; their outsides are either brown or black, and their surface rough. If a spurred grain be opened, a white flour is perceivable in it, which is covered with another of a reddish or brown colour. The latter has some degree of consistence, but may be easily crumbled between the fingers. Naturalists are unable to ascertain, with precision, the cause of this distemper; but it is supposed to be occasioned by the bite or sting of an insect, that turns the corn into a kind of gall; a conjecture which is partly confirmed by the taste left on the tongue, after eating such grain. The effects arising from the use of corn thus damaged, are said to be malignant fevers and gangrenes, in consequence of which the extremities of the body sometimes mortify, and spontaneously separate, without any pain or effusion of blood. Among the various insects which prey upon corn, none is more destructive than the corn-butterfly, which is generated in a manner similar to that of the common butterflies. It settles on one grain, and after having totally consumed it, its existence is supposed to be prolonged by eating its own excrement. When it has attained its full growth, it is about one-quarter of an inch in length, and half the thickness of the grain it has devoured. To exterminate this noxious insect, it has been recommended to prepare a very strong lye of wood-ashes, to which, when it becomes yellow, as much quick-lime should be added, as will make it of a dusky white: while it is as hot as the hand can well bear it, the grosser part of the lye should be suffered to subside, and the lye poured off into a proper vessel; into which the corn is to be immersed by means of a basket, and quickly agitated; skimming off

those grains which float on the surface. In the course of two or three minutes, it may be taken out, and the basket with its contents suspended on two poles to drain; after which it should be spread on the floor of a granary to dry, while a second basket undergoes a similar immersion. This simple process not only preserves the grain from rotting, but at the same time destroys all those insects that may have penetrated its substance. An oven is also employed for drying the seed; but, as it is difficult to ascertain the proper degree of heat, without injuring vegetation, and yet not always sufficient to extirpate the vermin, it is seldom practised. When corn has been kept a long time, it frequently happens that mites reduce the greater part of the grain to dust. This serious damage may be prevented by rubbing the adjacent places with fetid oils and herbs, such as garlic and dwarf-elder, the strong smell of which tends to expel them: besides, they may be exposed to the rays of the sun, which immediately destroy them. In order to ascertain the relative value of different species of grain, corn-dealers avail themselves chiefly of the combined criterion of weight and measure. In a commercial point of view, such a method is doubtless the most accurate; however, an attention to the following practical directions, will be of considerable advantage in the sale or purchase of corn in general: 1. Take a handful of grain from a heap, or sack, and compress it closely for a minute; then pass it from one hand into the other, and attentively examine its flavour, whether it possess any peculiar smell, different from that which is natural to the species: in which case you may conclude that it has been repeatedly exposed to moisture, and undergone a slight degree of fermentation. The flour obtained from such corn, is deficient in measure, of an indifferent quality, and affords neither nourishing, nor wholesome bread. 2. If, on pressure by the hand, the grains appear so solid and smooth that they in a manner glide through the fingers, without having any foreign smell or colour, in this case it may be pronounced perfectly dry, and in a good state of preservation. 3. Should, on the contrary, the corn feel rough, or, if a number of grains, after compressing them by the dry hand, clog together and adhere to the fingers, it may be justly apprehended that such wheat, rye, &c. is damp, and possessed of all the bad properties before specified. Every attentive observer will find, that frequently some species of grain bears a price in the market, far exceeding its relative value, or proportion to other kinds of grain, which, in many instances, may serve as excellent substitutes. From the prices which have prevailed in different countries, during a long series of years, we have derived the following result of numbers:

Wheat.....	41
Rye.....	32
Barley.....	23
Oats.....	14

TABLE OF PROPORTIONS.

	Wheat.	Rye.	Barley.	Oats.
Wheat.....	1 : 1	5 : 4	7 : 4	3 : 1
Rye.....	4 : 5	1 : 1	3 : 2	16 : 7
Barley.....	4 : 7	2 : 3	1 : 1	8 : 5
Oats.....	1 : 3	7 : 16	5 : 8	1 : 1

It deserves, however, to be remarked, that these proportions occasionally vary, accordingly as the soil of different countries is more favourable to the production of one species of grain than to the other; and likewise as there is a greater or less demand for particular kinds of corn in the market, especially in barren or unproductive seasons. Thus, in Britain, the price of barley and oats is almost constantly disproportionate to that of wheat, and especially to rye, which may, consequently, be considered as the cheapest bread-corn. The immense quantities of malt liquors brewed in this country, and the great number of horses kept for pleasure, are sufficient reasons why barley and oats are sold at prices comparatively higher than their intrinsic value, in relation to wheat and rye. But if the rates stated in the preceding table be adopted in the computation of prices, and the farmer, or corn-dealer, be desirous to know what proportion, for instance, the price of oats bears to that of rye, let him search in the horizontal line for oats, and in front of the perpendicular line for rye: the field, or partition where both meet, contains the numbers 7 : 16, namely, that the price of oats is in proportion to that of rye, as se-

ven to sixteen; and so forth, with respect to the other species of corn here exhibited.

CORN, in medicine and surgery, a hard tumour like a flat wart, growing in several parts of the feet, especially upon the joints of the toes. This disorder is attributed to the wearing of too strait or narrow-toed shoes, which never fail to produce these tubercles, especially if the person is obliged to stand or walk much, and in the summer time. The uneasiness occasioned by the pressure of corns may be prevented in the following manner: take a piece of linen, spread with any emollient plaster; lay one piece over another, eight, or ten, or more times, and cut a hole in the middle of them, exactly the same size and circumference as the corn, then apply it in such a way that the corn enters the hole in the plaster, and is thus defended against the contact of shoes and stockings. Such a plaster, properly applied, will frequently cure in a few weeks, without any other remedy. If the corn is at the bottom of the foot, a hole cut in a felt sole, so as to fit the corn, is sufficient. When this method is found inefficient, rub the corn with the volatile liniment, two or three times, in the twenty-four hours, keeping it covered in the intervals with an emollient plaster. Every morning and evening the foot must be kept in warm water for half an hour, and the corn well rubbed with soap. When softened with the water, it should be scraped with a blunt knife till the soft part is removed, and till the operation begin to give pain. This treatment is to be continued till the corn is entirely extirpated.

CORNAGE, [from *corne*, Fr. *cornu*, Lat.] a tenure which obliges the landholder to give notice of an invasion by blowing a horn.

CORNARO, HELENA LUCRETIA, a learned Venetian lady, daughter of John Baptist Cornaro. She not only acquired a complete knowledge of the languages and sciences, but went through the philosophy of the schools; and at last took her degrees at Padua, being the first lady that ever was made a doctor. She made a vow of perpetual virginity, and devoted her time entirely to study. The fame of her learning attracted the attention of Lewis XIV. who ordered the cardinals Bouillon and D'Etrees to call on her; and they reported that her talents had not been exaggerated. She died in 1685.

CORNE, an island in the gulf of Mexico, ten miles long, and one broad.

CORNEA TUNICA, in anatomy, the second coat of the eye. See ANATOMY, and EYE.

CORNEL TREE, in botany. See CORNUS.

CORNELIA LEX, the CORNELIAN LAW, in antiquity, a name given to 16 Roman laws: viz. 1. De civitate, enacted A.U.C. 670, by Sylla; confirming the Sulpician law, and requiring the citizens of the eight newly elected tribes to be divided among the 35 ancient tribes. 2. De judiciis, in 673, ordaining, that the prætor should always observe the same invariable method in judicial proceedings, and that the process should not depend upon will. 3. De sumptibus, limiting the expences of funerals. 4. De religione, in 677, restoring to the college of priests the privilege of choosing the priests, which by the Domitian law had been lodged in the hands of the people. 5. De municipiis, revoking all the privileges which had been granted to the towns that had assisted Marius and Cinna in the civil war. 6. De magistratibus, giving the power of bearing honours, and being promoted before the legal age, to those who had followed the interest of Sylla; while the sons and partizans of his enemies, who had been proscribed, were deprived of the privilege of standing for any office in the state. 7. De magistratibus, in 673, ordaining that no person should exercise the same office within ten years distance, or be invested with two different magistracies in one year. 8. De magistratibus, in 673, divesting the tribunes of the privilege of making laws, interfering, holding assemblies, and receiving appeals. All such as had been tribunes were incapable of holding any office in the state by that law. 9. De majestate, in 670, making it treason to lend an army out of a province, or engage in a war without orders, to influence the soldiers to spare or ransom a captive general of the enemy, to pardon the leaders of robbers or pirates, or for the absence of a Roman citizen to a foreign court without previous leave. The punishment was aquæ et ignis interdictio. 10. Giving the power to a man accused of murder, either by poison, weapons, or false accusations, and the setting fire

to buildings, to choose whether the jury that tried him should give their verdict clam or palam, viva voce, or by ballot. 11. Making it aquæ et ignis interdictio to such as were guilty of forgery, concealing and altering of wills, corruption, false accusations, and the debasing or counterfeiting of the public oath. All who were necessary to this offence were deemed as guilty as the offender. 12. De pecuniis repetundis; by which a man convicted of peculation or extortion in the provinces, was condemned to suffer the aquæ et ignis interdictio. 13. A law giving power to such as were sent into the provinces with any government, of retaining their command and appointment without a renewal of it by the senate. 14. Another ordaining that the lands of proscribed persons should be common, especially those about Volaterræ and Fesula in Etruria, which Sylla divided among his soldiers. All the above were enacted by Sylla. 15. A law by C. Cornelius tribune of the people, in 686; it ordains that no person should be exempted from any law according to the general custom, unless 200 senators were present in the senate; and no person thus exempted could hinder the bill of his exemption from being carried to the people for their concurrence. 16. Another by Nasica, in 582, to make war against Perseus, son of Philip, King of Macedonia, if he did not give proper satisfaction to the Roman people.

CORNER-STONES, among builders, the two stones which stand one in each jamb of a chimney. The breadth of each stone ought to be equal to that of the jamb, and its face to be hollowed in the sweep of a circle; their height ought to reach from the hearth to the mantle-tree: they are commonly made of Ryegate or fire-stone.

CORNET, [*cornette*, Fr.] in the military art of the ancients, an instrument much in the nature of a trumpet: when only it sounded, the ensigns were to march alone without the soldiers: whereas when the trumpet only sounded, the soldiers were to move without the ensigns. The cornets and buccinæ sounded the charge and retreat, and the cornets and trumpets sounded during the course of the battle.

CORNET, in the modern military æconomy, is the third officer in the company, and commands in the absence of the captain and lieutenant. He takes his title from his ensign, which is square; and is supposed to be called by that name from *cornu*, because placed on the wings, which form a kind of points or horns of the army. Others derive the name from coronet; alleging, that it was the ancient custom for these officers to wear coronets or garlands on their heads.

CORNETO, a town of the late Roman republic, in the department of Cimino, 37 miles N.W. of Rome.

CORNEUS, the name given by Linnaeus to a kind of tin ore, found in black columns, with irregular sides, and terminating in prisms.

CORN-FLAG. See **GLADIOLUS**.

CORN-FLOWER. See **CENTAUREA**.

CORNICE, **CORNICHE**, or **CORNISH**. See **ARCHITECTURE**. The word is used, in general, for all little projectures in masonry or joinery, even where there are no columns, as the cornice of a chimney, beaufet, &c.

CORNICE RING, in gunnery, the next ring from the muzzle backwards.

CORNICULARIUS, in antiquity, an officer in the Roman army, whose business was to assist the military tribune in quality of a lieutenant. The cornicularii went the rounds in lieu of the tribune, visited the watch, and were nearly what the aids major were in the French army, before the revolution.

CORNICULUM, in ancient geography, a town of the Sabines, E. of Crustumetum, towards the Anio.

CORNISH DIAMONDS, crystals found in digging the tin-mines of Cornwall.

CORN-MARIGOLD. See **CHRYSANTHEMUM**.

CORN-MILL. See **MECHANICS**.

CORNOGAL, a town in the island of Ceylon, 30 miles N.W. of Candi.

CORN-PARSLEY. See **SISON**.

CORN-ROCKET, is a species of **Bunias**.

CORN-ROSE. See **PAPAVER**.

CORN-SALLAD, a species of **Valeriana**.

CORNU-CERVI. See **HARTSHORN**.

CORNUBIA, the ancient name of Cornwall.

CORNUCOPIÆ, among the ancient poets, a horn out of which

proceeded plenty of all things; by a particular privilege which Jupiter granted his nurse, the goat Amalthea.

CORNUCOPIÆ, in architecture and sculpture, is represented under the figure of a large horn, out of which issue fruits, flowers, &c. On medals, F. Joubert observes, the cornucopia is given to all deities.

CORNUCOPIÆ, in botany, a genus of the digynia order, and triandria class of plants; natural order, Gramina. Involucrum monophyllous, funnel-shaped, crenated, and multiflorous; calyx bivalved; corolla one-valved. There are two species.

CORNUS, **CORNEL-TREE**, **CORNELIAN CHERRY**, or **DOG-WOOD**, a genus of the monogynia order, and tetrandria class of plants; natural order, Stellatæ. Involucrum most frequently tetraphyllous; petals four, above the receptacle of the fruit; fruit a bilocular kernel. Twelve species are enumerated.

C. FLORIDA, or **VIRGINIAN DOG-WOOD**, has a tree-stem branching 12 or 15 feet high, and fine red shoots garnished with large heart-shaped leaves; and the branches terminated by umbellate white flowers, having a large involucrum succeeded by dark red berries.

CORNUTIA, in botany, a genus of the angiospermia order and didynamia class of plants; natural order, Personatæ. Calyx quinque-dentated; stamina larger than the corolla; style very long; berry monospermous. It has two species, *C. pyramidata*, with a blue pyramidal flower, and hoary leaves, it grows plentifully in several islands in the West Indies, at Campeachy, and La Vera Cruz. It rises to the height of 10 or 12 feet, with rude branches, the leaves being placed opposite. *C. quinata*, is a native of China, in the woods near Canton.

CORNWALL, a county of England, which forms the S.W. extremity of Great Britain. It is bounded by the English channel on the S. St. George's channel on the N.W. the Bristol channel on the N. and on the E. by the river Tamar, which separates it from Devonshire. Its name is supposed by some to be compounded of *corn*, signifying a rock in the British language, and *Gauls* or *Waules*, the name the Saxons gave to the Britons. Others think it is derived from the Latin *cornu*, or the British *kern*, a horn; on account of its running out into the sea somewhat in the form of a horn. Its chief rivers are the Tamar, Fale, Cober, Looe, Camel, Fowey, Haile, Lemara, Kense, and Aire. Its principal head-lands are the Land's-end, the Lizard, Cape Cornwall, Deadman's-head, Rame-head, &c. and a cluster of islands, 145 in number, called the Scilly isles, supposed formerly to have been joined to the main land, though now 30 miles distant; abounding with antiquities, particularly druidical. This county abounds in mines of different metals and semi-metals; but the principal produce is tin. The Phenicians visited these coasts for this article, about 400 or 450 years before Christ; and the mines continued to be wrought with various success at different periods. Mundie, a scarce mineral ore, of a white brassy or brown colour, is found in large quantities, intermixed with tin, copper, and lead, and sometimes by itself. Iron ore is found at Cornwall, but the working of it does not answer. There is no richer copper, nor a greater variety any where, than in this county. Silver has been rarely found, nor do the lead mines answer. Very late discoveries have proved that Cornwall has more gold than was formerly imagined. The cornish diamond is a figured crystal, generally hexagonal and pyramidal, or columnar, or both, of a fine clear water. Of all our bastard diamonds, it is esteemed the best. They are of different colours, black, yellow, &c. The clearer they are, the better they will bear engraving for seals.

CORNWALL, a township of Connecticut, in Litchfield county.

CORNWALLIS, a river of Nova Scotia.

CORNWALLIS, a town of Nova Scotia, in King's county.

COROLLA, among botanists, the most conspicuous part of a flower, surrounding the organs of generation, and composed of one or more flower-leaves, most commonly called petals, to distinguish them from the leaves of the plant: according as there is one, two, or three of these petals, the corolla is said to be monopetalous, dipetalous, tripetalous, &c. See **BOTANY**.

COROLLARY, [*corollarium*, Lat. from *corolla*; *finis coronat opus*; *corollair*, Fr.] is an useful consequence drawn from something already advanced, or demonstrated: thus it being demonstrated that a triangle which has two equal sides, has also two angles equal; this corollary will follow, that a triangle which has three sides equal, has also its three angles equal.

COROMANDEL, the eastern coast of the peninsula on this side

side the Ganges in Asia. It is bounded by the N. by Golconda, on the E. by the bay of Bengal, on the S. by Madura, and on the W. by Bisanagar. This coast so much resembles that of Orixá, that the Abbé Raynal considers them as one, and gives to both the general name of Coromandel. An excessive heat reigns from the beginning of May to the end of October. It begins at nine in the morning, and continues till nine in the evening. During the night it is allayed by a sea breeze from the S.E. The British have formed on it several settlements.

CORON, a town of Turkey in Europe, in the territory of Belvidere, 80 miles S. S. W. of Corinth.

CORONA, [Latin,] in architecture, a large flat member of the cornice, so called because it crowns the entablature and the whole order. It is called by workmen the drip. See **ARCHITECTURE**.

CORONA, in botany, a name given by some to the circumference or margin of a radiated compound flower.

CORONA, in natural history and optics, a luminous circle surrounding the sun, moon, planets, and stars. See **HALO**, and **PARHELION**.

CORONA BOREALIS, the northern crown or garland, in astronomy, a constellation of the northern hemisphere, whose stars in Ptolemy's catalogue are eight, in Tycho's as many, and in Mr. Flamsteed's thirty-one.

CORONALE OS, the os frontis. See **ANATOMY**.

CORONARIE, in botany, the tenth order of plants in Linnaeus's Fragments of a Natural Method. Under this name Linnaeus gives a great number of genera, most of which furnish very beautiful flowers, as the hyacinthus, agave, polyanthus, &c.

CORONARY ARTERIES. See **ANATOMY**.

CORONARY, STOMACHIC, a vein inserted into the trunk of the splenic vein, which, by uniting with the mesenteric, forms the vena porta.

CORONARY VEIN, a vein diffused over the exterior surface of the heart.

CORONARY VESSELS, vessels which furnish the substance of the heart with blood.

CORONATION, [from *corona*, Lat.] the public and solemn confirming of the title, and acknowledging of the right of governing, to a king or queen; at which time the prince swears reciprocally to the people, to observe the laws, customs, and privileges of the kingdom, and to act and do all things conformable thereto.

CORONATOR, in old records, a coroner.

CORONDA AL REIG, a town of Persia, in Irak, 35 miles N. W. of Ispahan.

CORONE, in ancient geography, a town of Messenia, situated on the sea. Pausanias takes it to be the *Æpea* of Homer; but Strabo Thuria, and Pliny, Pedassus. It is now called Coron.

CORONER, [from *corona*, Lat.] an officer whose duty it is to inquire, on the part of the king, how any violent death was occasioned; for which purpose a jury is empannelled. Coroner is an ancient officer in England, so called because he hath principally to do with pleas of the crown, or such wherein the king is more immediately concerned. And in this light, the lord chief justice of the king's bench is the principal coroner in the kingdom; and may, if he please, exercise the jurisdiction of a coroner in any part of the realm. But there are also particular coroners for every county of England; usually four, sometimes six, and sometimes fewer. This officer is of equal authority with the sheriff; and was ordained, together with him, to keep the peace when the earls gave up the wardship of the county. He is chosen by all the freeholders of the county court; and by the statute of Westminster, 1. it was enacted that none but lawful and discreet knights should be chosen: but it seems now sufficient if a man have lands enough to be made a knight, whether he be really knighted or not: for the coroner ought to have an estate sufficient to maintain the dignity of his office, and answer any fines that may be made upon him for his misbehaviour; and, if he hath not enough to answer, his fine shall be levied upon the county, as a punishment for electing an insufficient officer. Now, indeed, through the culpable neglect of gentlemen of property, this office has been suffered to fall into disrepute, and get into low and indigent hands; so that although formerly no coroners would be paid for serving their country, and they were by the aforesaid statute of Westminster, 1. expressly forbidden to take a reward under pain of great forfeiture to the king; yet for many years past they have only desired to be chosen for

the sake of their perquisites; being allowed fees for their attendance by the statute 3 Hen. VII. c. 1. which Sir Edward Coke complains of heavily, though since his time those fees have been much enlarged. The coroner is chosen for life; but may be removed, either by being made sheriff, or chosen verderor, which are offices incompatible with the other; and by the statute 25 Geo. II. c. 29, extortion, neglect, or misbehaviour, are also made causes of removal.

CORONERS, OFFICE AND POWERS OF. These are like those of the sheriff, either judicial or ministerial; but principally judicial. This is in great measure ascertained by statute 4 Edw. I. De Officio Coronatoris; and consists, first, in inquiring, when any person is slain, or dies suddenly, or in prison, concerning the manner of his death. And this must be super visum corporis; for if the body is not found, the coroner cannot sit. He must also sit at the very place where the death happened. And his inquiry is made by a jury from four, five, or six of the neighbouring towns, over whom he is to preside. If any be found guilty by this inquest of murder, he is to commit to prison for farther trial, and is also to inquire concerning their lands, goods, and chattels, which are forfeited thereby; but whether it be murder or not, he must inquire whether any deodand has accrued to the king, or the lord of the franchise, by this death; and must certify the whole of this inquisition to the court of King's Bench, or the next assizes. Another branch of his office is to inquire concerning shipwrecks; and certify whether wreck or not, and who is in possession of the goods. Concerning treasure trove, he is also to inquire concerning the finders, and where it is, and whether any one be suspected of having found and concealed a treasure; "and that may well be perceived (saith the old statute of Edw. I.) where one liveth riotously, haunting taverns; and hath done so of long time; whereupon he might be attached and held to bail upon this suspicion only. The ministerial office of the coroner is only as the sheriff's substitute. For when just exception can be taken to the sheriff, for suspicion of partiality (as that he is interested in the suit, or of kindred or either plaintiff or defendant), the process must then be awarded to the coroner, instead of the sheriff, for execution of the king's writs. The coroner shall have for his fee, upon every inquisition taken upon the view of the body slain, 13s. 4d. of the goods and chattels of him that is the slayer and murderer, if he have any goods; and if he have no goods, of such amerciaments, as any township should happen to be amerced for the escape of the murderer, 3 Hen. VII. But as the said fee of 13s. 4d. is not an adequate reward for the general execution of the said office, therefore for every inquisition taken upon view of a body dying in gaol the coroner shall have 20s. and also 9d. for every mile he shall be compelled to travel from his usual place of abode to take such inquisition, to be paid by order of the justices in sessions, out of the country rates, 25 Geo. II. c. 29. s. 1.

CORONET. See **CROWN**.

CORONILLA, JOINTED PODDED COLUTEA: a genus of the decandria order, and diadelphia class of plants; natural order papilionaceae. Calyx bilabiated; vexillum scarce any longer than the alae; legumen contracted between the seeds. Fourteen species, mostly natives of France, Switzerland, and Italy, are enumerated.

CORONIS, in the heathen mythology, a nymph, the mother of Esculapius.

CORONOID PROCESS. See **ANATOMY**.

COROORAA, one of the Pelew islands.

COROPA, a province of South America, situated between the river Amazon and lake Parime.

CORPORA PYRAMIDALIA, are two protuberances of the under part of the cerebellum, about an inch long; so called from their resemblance to a pyramid.

CORPORAL, an inferior officer under a serjeant in a company of foot, who has charge over one of the divisions, places and relieves centinels, and keeps good order in the corps de garde: he also receives the word from the inferior rounds, which passes by his corps de garde. This officer carries a fusée, and is commonly an old soldier: there are generally three corporals in each company.

CORPORAL, CORPORALE, is also an ancient church-term, signifying the sacred linen spread under the chalice in the eucharist and mass, to receive the fragments of the bread.

CORPORAL OF A SHIP, an officer that has the charge of setting the watches and sentries, and relieving them; who sees that all

the soldiers and sailors keep their arms neat and clean, and teaches them how to use them. He has a mate under him.

CORPORAL OF A SHIP OF WAR is under the master at arms, and is employed to teach the officers the exercise of small arms, or of musketry; to attend at the gang way, on entering ports, and observe that no spirituous liquors are brought into the ship, unless by express leave from the officers. He is also to extinguish the fires and candles at eight o'clock in winter and nine in summer, when the evening gun is fired; and to walk frequently down in the lower decks in his watch, to see that there are no lights but such as are under the charge of proper centinels.

CORPORATION, [*corpus*, Lat.] A corporation is a body politic, authorised by the king's charter to have a common seal, one head officer or more, and members, able, by their common consent, to grant or receive, in law, any thing within the compass of their charter: even as one man may do by law all things, that by law he is not forbidden; and bindeth his successors, as a single man binds his executor or heir.

CORPORATION ACT is that which prevents any person being legally elected into any office relating to the government of any city or corporation, unless within a twelvemonth before he has received the sacrament of the Lord's supper, according to the rites of the church of England; and which enjoins him to take the oaths of allegiance and supremacy when he takes the oath of office; otherwise his election is void.

CORPORATIONS, AGGREGATE, consist of many persons united together into one society, and are kept up by a perpetual succession of members, so as to continue for ever; of which kind are the mayor and commonalty of a city: the head and fellows of a college; the dean and chapter of a cathedral church.

CORPORATIONS, ECCLESIASTICAL, are where the members that compose it are entirely spiritual persons; such as bishops; certain deans and prebendaries; all archdeacons, parsons, and vicars: which are sole corporations: deans and chapters at present, and formerly prior and convent, abbot and monks, and the like, bodies aggregate. These are erected for the furtherance of religion, and perpetuating the rights of the church.

CORPORATION, LAY, are of two kinds, civil and eleemosynary.

1. **CORPORATIONS, CIVIL**, are such as are erected for a variety of temporal purposes. The king, for instance, is made a corporation to prevent the possibility of an interregnum or vacancy of the throne, and to preserve the possessions of the crown entire; for, immediately upon the demise of one king, his successor is in full possession of the regal rights and dignity. Other lay corporations are erected for the good government of a town or particular district, as a mayor and commonalty, bailiff and burgesses, or the like: some for the advancement and regulation of manufactures and commerce; as the trading companies of London, Edinburgh, &c. and some for the better carrying on of divers special purposes; as churchwardens, for conservation of the goods of the parish; the college of physicians and company of surgeons in London, for the improvement of the medical science; the royal society for the advancement of natural knowledge; and the society of antiquarians for promoting the study of antiquities.

2. **CORPORATIONS, ELEEMOSYNARY**, are such as are constituted for the perpetual distribution of the free alms, or bounty, of the founder, to such persons as he has directed. Of this kind are all hospitals for the maintenance of the poor, sick, and impotent; and all colleges; which last are founded for two purposes: 1. For the promotion of piety and learning by proper regulations and ordinances. 2. For imparting assistance to the members of those bodies, in order to enable them to prosecute their devotion and studies with greater ease and assiduity.

CORPORATIONS, SOLE, consist of one person only and his successors, in some particular station, who are incorporated by law, to give them some legal capacities and advantages, particularly that of perpetuity, which in their natural persons they could not have had. In this sense the king is a sole corporation: so is a bishop: so are some deans and prebendaries, distinct from their several chapters; and so is every parson and vicar. And the use of this institution will be apparent, if we consider the case of a parson of a church. At the original endowment of parish churches, the freehold of the church, the church-yard, the parsonage house, the glebe, and the tithes of the parish, were vested in the then parson by the bounty of the donor, as a temporal recompence to him for his spiritual care of the inhabitants, and with intent that the same

emoluments should ever afterwards continue as a recompence for the same care. But how was this to be effected? The freehold was vested in the parson; and, if we suppose it vested in his natural capacity, on his death, it might descend to his heir, and would be liable to his debts and incumbrances; or at best the heir might be compellable, at some trouble and expence, to convey those rights to the succeeding incumbent. The law therefore has wisely ordained, that the parson, quatenus parson, shall never die, any more than the king; by making him and his successors a corporation. By which means all the original rights of the parsonage are preserved entire to the successor: for the present incumbent, and his predecessor who lived seven centuries ago, are in law one and the same person; and what was given to the one, was given to the other also.

CORPOREITY, [from *corporeus*, Lat.] materiality; the quality of being embodied; the state of having a body; bodiliness.

CORPOREITY is the quality of that which is corporeal, or is body; or that which constitutes or denominates it such. The corporeity of God was the capital error of the Anthropomorphites. Some authors reproach Tertullian with admitting a corporeity in the Deity; but it is manifest that by the body he means no more than subsistence. The Mohammedans reproach the Samaritans to this day, with a belief of the corporeity of God. Many of the ancients believed the corporeity of angels.

CORPS, in architecture, a term borrowed from the French, signifying any part that projects or advances beyond the naked of a wall; and which serves as a ground for some decorations, or the like.

CORPS, in geography, a town of France, in the department of Isere, 20 miles S. E. of Grenoble.

CORPS DE BATAILLE, is the main body of an army drawn up for battle.

CORPS DE GARDE, a post in an army, sometimes under covert, sometimes in the open air, to receive a body of soldiery, who are relieved from time to time, and are to watch in their turns, for the security of a quarter, a camp station, &c. The word is also used for the men who watch therein. It is usual to have also a little corps de garde, at a good distance before the lines, to be the more readily advertised of the approach of the enemy.

CORPSES, LAWS RESPECTING. If any one, in taking up a dead body, steals the shroud, or other apparel, it is felony. Stealing only the corpse itself is not felony; but it is punishable as a misdemeanor by indictment at common law.

CORPULENCY, or OBESITY, in physiology, is the accumulation of too great a quantity of fat or animal oil, which distends the solids to an unnatural degree, by the abundance of granulated matter collected in the cellular membrane. Corpulency arises from a variety of causes, which may operate separately, or conjointly in the same constitution. It may, however, be principally ascribed, 1. To the introduction of too much oil into the habit, through the channels of nourishment, by which means it is retained in too large a quantity. 2. An over laxity, or perhaps too large a structure of the cells in which it is deposited, so as to admit and retain an immoderate proportion of unctuous matter. 3. To a peculiar disposition of the blood, which renders it liable to separate too easily from its oleaginous particles, and to admit of their being strained off too plentifully by the secretory vessels; or, lastly, to defective evacuation or expulsion of oil already absorbed, separated from the blood, and deposited in its cells, instead of being discharged through the different excretories of the body. Corpulency is the occasion of various diseases, and particularly of the apoplexy. It was held infamous among the ancient Lacedæmonians. Sennertus mentions a man that weighed 600lbs, and a maid 36 years of age who weighed 450. Bright of Malden, who died at the age of 29, in 1750, weighed 616lbs. Obesity is promoted by whatever tends to soften the blood, and render it less sharp and saline; such as want of exercise and motion, an indolent life, indulgence in too much sleep, &c. It may be removed or prevented by the contrary causes, and particularly by the use of saline and acid food and drink. Chiapin Vitelli, marquis of Cerona, a noted Spanish general in his time, from an excessive corpulency, is said to have reduced himself, by drinking vinegar, to such a degree of leanness, that he could fold his skin several times round him. Castile soap, in the form of a bolus, an electuary, pills, or dissolved in a gill or more of soft water, from one to four drachms, taken at bed-time, is strongly recommended

with a view of reducing corpulency, in a discourse on its nature, causes, and cure, by Malcolm Fleming, M.D. Lond. 1760. See MEDICINE.

CORPUSCLE, in physics, signifies a minute particle, or physical atom, being such as a natural body is made up of; that is such particles, whether of a simple or compound nature, whose parts will not be dissolved nor dissipated by ordinary degrees of heat. See PHYSICS.

CORPUSCULARIAN PHILOSOPHY, is that way of philosophising which endeavours to explain things, and to account for the phenomena of nature, by the motion, figure, rest, position, &c. of the corpuscles, or the minute particles of matter. Mr. Boyle sums up the chief principles of the corpuscular hypothesis, which now flourishes under the mechanical philosophy, in these particulars: 1. They suppose that there is but one catholic or universal matter, which is an extended, impenetrable, and divisible substance, common to all bodies, and capable of all forms. 2. That this matter, in order to form the vast variety of natural bodies, must have motion in some or all its assignable parts; and that this motion was given to matter by God, the Creator of all things, and has all manner of directions and tendencies. 3. Matter must also be actually divided into parts, and each of these primitive particles, fragments, or atoms of matter, must have its proper magnitude or size, as also its peculiar figure or shape. 4. They suppose also, these differently sized and shaped particles may have as different orders and positions, whereof great variety may arise in the composition of bodies. See PHYSICS.

CORREA, in botany, a genus of the class and order octandria monogynia: calyx campanulate, four-toothed; petals four, reflected at the ends; capsule four-celled, four-valved, with a single seed in each. One species, the alba, a shrub of Port Jackson.

CORRECTION, in printing, the act of retrenching the faults in a work; or the reading which the corrector gives the proofs, to point out and amend the faults, to be rectified by the compositor. The corrections are placed on the margin of every page, against the line in which the faults are found; and there are different characters used to express different corrections: thus § is put for dele, to intimate that something, as a point, letter, word, &c. dashed in that line is to be taken out. If any thing is to be inserted, the place is to be marked thus A, and the thing to be inserted added in the margin. When there are two or more corrections in the same line, then they are all separated in the margin by little bars, thus |. If a space is omitted, its place is marked with a caret, and in the margin thus †. When a letter is inverted, it is expressed in the margin thus 9. When any thing is to be transposed, it is directed thus, Extraordinary scarce ever fail of attainments exciting envy, for Extraordinary attainments scarce ever fail of exciting envy, and in the margin is added *tr.* If Italic characters are to be changed for Roman, or vice versa, a line is drawn thus — under the letters, and Rom. or Ital. is written in the margin. If a space, or an m or n quadrat, stick up, and print black, it is marked in the margin with a dash, thus |. If a word, sentence, or paragraph is entirely omitted, the place is marked with a caret, and in the margin is put the word *out*. If the letters of a word stand too far asunder, a line is drawn under them, and in the margin is put a crooked line or hook, thus 7. There are many other marks used in correcting, *sup.* for superior, *cap.* for capital, *l. c.* for lower-case, &c.

CORRECTOR OF THE STAPLE, a clerk belonging to the staple, who records the bargains made by the merchants.

CORREGIDOR, an officer of justice in Spain; the chief judge of a town or province.

CORREGIO, a late principality of Italy, united to the duchy of Modena.

CORREGIO, a town of the Cisalpine republic, in the late duchy of Modena, 25 miles S. of Mantua.

CORREGIO, ANTONIO, an eminent historical painter, born in 1494, and whose original name was Allegri, which was changed to that of his birth-place. Being descended of poor parents, and educated in an obscure village, he enjoyed none of those advantages which contributed to form the other great painters of that illustrious age. He saw none of the statues of ancient Greece or Rome; nor any of the works of the established schools of Rome and Venice. But Nature was his guide; and Corregio was one of her favorite pupils. To express the facility with which he paint-

ed, he used to say that he always had his thoughts ready at the end of his pencil. The agreeable smile, and the profusion of graces which he gave to his madonnas, saints, and children, have been said to be sometimes unnatural; but still they are amiable and seducing: an easy and flowing pencil, an union and harmony of colours, and a perfect intelligence of light and shade, give an astonishing relief to all his pictures, and have been the admiration both of his contemporaries and his successors. Annibal Caracci, who flourished 50 years after him, studied and adopted his manner in preference to that of any other master. From want of curiosity or of patronage, Corregio never visited Rome, but remained his whole life at Parma, where the art of painting was little esteemed, and poorly rewarded. This concurrence of unfavourable circumstances occasioned at last his premature death at the age of 40. He was employed to paint the cupola of the cathedral at Parma, the subject of which is an assumption of the Virgin; and having executed it in a manner that has long been the admiration of every person of good taste, for the grandeur of design, and especially for the boldness of the fore-shortenings (an art which he first and at once brought to the utmost perfection), he went to receive his payment. The canons of the church, either through ignorance or baseness, found fault with his work; and although the price originally agreed upon had been very moderate, they alledged that it was far above the merit of the artist, and forced him to accept of the poultry sum of 200 livres, which, to add to the indignity, they paid him in copper money. To carry home this unworthy load to his indignant wife and children, poor Corregio had to travel six or eight miles from Parma. The weight of his burden, the heat of the weather, and his chagrin at this villanous treatment, immediately threw him into a pleurisy, which in three days put an end to his life and his misfortunes, in 1534. For the preservation of this magnificent work, the world is indebted to Titian. As he passed through Parma, in the suite of Charles V. he run instantly to see the chief d'œuvre of Corregio. While he was attentively viewing it, one of the principal canons of the church told him that such a grotesque performance did not merit his notice, and that they intended soon to have the whole defaced. "Have a care of what you do," (replied the other,) "if I were not Titian, I would certainly wish to be Corregio."

CORREZE, a department of France, bounded by those of Upper Vienne and Creuse on the N. Puy de Dome on the E. Cantal on the S. E. Lot on the S. and Dordogne on the W. It includes the late province of Limosin. Tulle is the capital.

CORREZE, a river of France, which rises about 20 miles N. E. of Tulle, and joins the Vezere, three miles below Brives.

CORREZE, a town in the department of Correze, 8 miles N. E. of Tulle.

CORRIGIOLA, in botany, a genus of the trigynia order, and pentandria class of plants; natural order Holoraceæ. Calyx five-leaved; petals five; seed one, three-sided. There is but one species, viz. *C. litoralis*, bastard knot-grass, a native of France, Germany, Switzerland, and Piedmont, in sandy soils, usually near the sea or rivers.

CORRIRA, the **COURIER**, in natural history, a genus of birds of the order grallæ. Bill short and straight, and without teeth; legs long; thighs longer than the body; feet palmated, with a back toe. One species, is a native of Italy, remarkable for the extreme length of its neck as well as legs; it runs with peculiar speed, and derives, unquestionably, from this circumstance its popular designation of courier.

CORROSION, [*corrodo*, Latin,] in a general sense, the action of gnawing away, by degrees, the continuity of the parts of bodies. Acids corrode most natural bodies.

CORROSIVE SUBLIMATE, an old name for the oxymuriate of mercury, or as it is called in the shops muriated mercury. If muriatic acid be added to the yellow sulphate of mercury, or to the nitrate of mercury, muriate of mercury is formed, which is soluble in water, and which on account of its properties was formerly called corrosive sublimate, or corrosive muriate of mercury.

CORROSIVES, in surgery, are chiefly burnt alum, red and white precipitates of mercury, white vitriol, butter of antimony, lapis infernalis, &c.

CORRUPTICOLÆ, a sect who rose out of the Monophysites in Egypt, about A. D. 519, under their chief Severus, the pretended patriarch of Alexandria. Their distinguishing doctrine

was, that the body of Jesus Christ was corruptible; and that to deny it was to deny the truth of our Saviour's passion.

CORRUPTION, [*corruptio*, Lat.] the destruction of the proper mode of existence of any natural body.

CORRUPTION OF BLOOD, in law, an infection accruing to a man's state, attainted of felony and treason, and to his issue; for as he loses all to the prince, &c. his issue cannot be heirs to him, or to any other ancestor by him; and if he were noble his heirs are rendered ignoble.

CORSAIR, [French,] a private; one who professes to scour the sea, and seize merchants. Corsair is derived from the Italian *corsare*, of *corso* or *a cursibus*, courses, or excursions. The name is commonly given to the piratical cruisers of Barbary, who had their rise about the beginning of the 16th century. A corsair is distinguished from a privateer in this, that the latter has a commission, and only attacks the vessels of those at war with the state whence his commission is derived. The punishment of a corsair is to be hanged, without remission; whereas privateers are to be treated as prisoners of war.

CORSELET, a little cuirass, or, according to others, an armour or coats made to cover the whole body, anciently worn by the pike-men, usually placed in the front and flanks of the battle, for the better resisting of the enemy's assaults, and guarding of the soldiers placed behind them.

CORSIARA, a town of Persia, in the province of Farlistan; 100 miles S. W. of Schiras.

CORSICA, an island, in that part of the Mediterranean, anciently called the Sea of Liguria, between 8° and 10° Lon. E. and between 41° and 43° Lat. N. On the S. side it is separated from Sardinia, by a narrow strait, anciently called *τρωγος* by the Greeks, and Fossa by the Romans; 60 stadia, or about seven miles broad. It is now called *Boccardia Bonifacio*.

CORSNED, or **MORSEL OF EXECRATION**, a species of trial, or purgation, anciently in use among us, and which probably arose from an abuse of revelation, in the dark ages of superstition. It consisted of a piece of cheese or bread, about an ounce in weight, which was consecrated with a form of exorcism; desiring of the Almighty that it might cause convulsions and paleness, and find no passage if the man were really guilty; but might turn to health and nourishment if he were innocent; as the water of jealousy among the Jews was, by God's especial appointment, to cause the belly to swell, and the thigh to rot, if the woman were guilty of adultery. This corsned was given to the suspected person, who at the same time received the sacrament. Historians assure us, that Godwin, earl of Kent, in the reign of king Edward the Confessor, abjuring the death of the king's brother, at last appealed to his corsned, which stuck in his throat and killed him. This custom has been long abolished, but the remembrance of it still subsists in certain phrases of abjuration; as "I will take the sacrament upon it; May this morsel be my last," &c.

CORSOER, a town of Denmark, on the W. coast of Zealand, 52 miles S. W. of Copenhagen. Lon. 11. 12. E. Lat. 55. 12. N.

CORTATE, a town of Hindostan, N. of Cape Comorin.

CORTE, a territory of Corsica, near the centre of the island.

CORTE, a town in the above territory, 27 miles S. W. of Bastia.

CORTES, or **CÓRTEZ**, **FERDINAND**, a Spanish general, famous for the conquest of Mexico, and other victories over the natives of S. America; but exceedingly infamous for the cruelties he committed upon the vanquished, without regard to rank, age, or sex. It probably was on this account he was coolly received on his return to Europe, by his master Charles V. It is even said, that the emperor asked him who he was? to which Cortez replied, "I am the man who has given you more provinces, than your ancestors left you towns." He died in 1554, aged 65.

CORTIS, a town of Germany, in the bishopric of Liege, 10 miles N. E. of Ramillies.

CORTONA, a town of Italy, in Tuscany, 32 miles E. of Sienna. Lon. 11. 52. E. Lat. 43. 14. N.

CORTULA, in botany, a genus of the syngenesia polygamia superflua class and order. Natural order Composite Discoidea, or compound radiated flowers. Receptacle almost naked; down margined; corollules of the disk four-cleft; in the ray scarcely any. There are fifteen species, mostly natives of the Cape.

CORTUSA, **BEAR'S EARSANICLE**: a genus of the monogynia order, and pentandria class of plants, natural order, Preciæ. Corolla wheel-shaped, with its throat like an elevated ring; capsule unilocular, oval, quinquevalved at the top. There are two species, both very low, flowery, herbaceous perennials, crowned by umbels of monopetalous wheel-shaped flowers, of a fine red colour, natives of mountainous rocky parts abroad.

CORVEY, a town and small principality of Germany, in the circle of Westphalia, 12 miles long, and 12 broad.

CORUNDUM, a mineral, of which there are two species, the perfect and imperfect. Perfect corundum or sapphire is found in the East Indies, especially in Pegu and the island of Ceylon; and it is most commonly crystallized. The crystals are not large; their primitive form is a rhomboid whose angles are 86° and 94°, and which therefore is nearly rectangular. Sometimes it occurs in this form, though but seldom. Bournon has described no less than eight modifications of it. The texture of the sapphire is foliated; but in the more perfect specimens the plates are separated with difficulty. Fracture conchoidal. Specific gravity from 3.207 to 4.161. Colour most frequently blue; sometimes red, purple, yellow, and green; and sometimes colourless: imperfect corundum is usually crystallized; sometimes found in amorphous masses. The figures of the crystals are the same as those of the last species; opaque, except when in very thin pieces; specific gravity from 3.710 to 4.180; colour grey, often with various shades of blue and green. Mr. Chenevix obtained the following constituents from different specimens of corundum subjected to chemical analysis.

Imperfect corundum.

	From the Carnatic.	From Malabar.	From China.	From Ava.
Silica	5.0	7.0	5.25	6.5
Alumina	91.0	86.5	86.50	87.0
Iron	1.5	4.0	6.50	4.5
Loss	2.5	2.5	1.75	2.0
	100.0	100.0	100.0	100.0

Perfect corundum.

	Blue, or sapphire.	Red, or oriental ruby.
Silica	5.25	7.0
Alumina	92.00	90.0
Iron	1.00	1.2
Loss	1.75	1.8
	100.00	100.0

CORUNNA, a port town of Galicia in Spain, situated on a fine bay of the Atlantic, about 32 miles N. of Compostella.

CORVO, the smallest and most northern island of the Azores, being only 12 miles in circumference. It abounds in crows, whence the name. Lon. 31° 4' 56" W. Lat. 39° 43' 38" N.

CORUS, **OMER**, **HOMER**, or **CHOMER**, in the Jewish antiquities, a measure containing 10 baths, or 75 gallons and 5 pints, as a measure for things liquid, and 32 pecks and one pint, as a measure for things dry.

CORUS, in old records, eight bushels.

CORUSCATION, [*coruscatio*, Lat.] flash; quick vibration of light. Coruscation is chiefly used for a flash of lightning darting from the clouds in time of thunder. See **METEOROLOGY**.

CORVUS, in antiquity, a military engine, or rather gallery, moveable at pleasure by means of pulleys; chiefly used by the Romans, in boarding the enemy's ships to cover the men.

CORVUS, in ornithology, the **RAVEN** or **CROW**; a genus of birds of the order picæ. Beak convex, cultrated; nostrils covered with bristly feathers; tongue forked, cartilaginous; toes three. There are above 40 species. The following are the most remarkable:

C. CANADENSIS is nine inches long and weighs two ounces. The bill is blackish, and not quite an inch long; the irides are black: the forehead and throat a dirty yellowish white; the hind head and sides blackish. brown: the upper parts of the body brown;

brown; beneath pale ash; palest on the breast; the quills and tail are brown, tipped with white; the tail is a little wedged: the legs and claws are blackish. These birds inhabit Canada; and are common near Hudson's Bay, where they are called Whiskie-john.

C. CARYOCATACTES, the **NUTCRACKER**, is somewhat less than the jack-daw: the bill is strong, straight, and black; the colour of the whole head and neck, breast and body, of a rusty brown: the crown of the head and rump are plain; the other parts marked with triangular white spots; the wings black; the coverts spotted like the body; the tail rounded at the end, black tipped with white; the vent feathers are white; the legs dusky. These birds are scattered in many parts of Europe, but no where so numerous as in Germany.

C. CORAX, the **RAVEN** of English authors, weighs three lb. and is about two feet in length: the colour is black, finely glossed with a rich blue; the belly excepted, which is of a dusky colour. They are very docile, and may be trained up to fowling like hawks; to fetch and carry like spaniels; they may be taught to speak like parrots; and, what is the most extraordinary of all, they may be taught to imitate the human voice in singing. They have a great propensity to pilfer, often hiding things of value. They frequent the neighbourhood of great towns, where they are used in devouring the carcases and filth which would otherwise prove a nuisance. They also destroy many living animals; such as, rabbits, ducks, chickens, and even lambs which have been dropped in a weak state. In clear weather they fly in pairs to a great height, making a deep loud noise, different from the common croaking. See Plate XXXVIII.

CORVUS CORNIX, the **ROYSTON CROW**, pretty much resembles the rook, feeding on insects, and flying together in great flocks. In England it is a bird of passage, visiting it in the beginning of winter, and leaving it with the woodcocks.

C. CORONE, the **CARRION CROW**, agrees with the raven, in the form of its body, as well as in its food. It also eats grain and insects; and like the raven picks out the eyes of animals; whence it was formerly distinguished from the rook, (which feeds entirely on grain and insects) by the name of the gor, or gor crow.

C. FRUGILEGUS, the **ROOK**, is the *corvus* of Virgil; no other species of this genus being gregarious. It differs not greatly in its form from the carrion crow; the most remarkable difference is in the nostrils and root of the bill; which in the crow are well clothed with feathers, but in the rook are bare, or covered only with some bristly hairs. This arises from its thrusting the bill into the earth, after the worms and erucæ of insects, on which it feeds; for it does not live on carrion. It feeds on all sorts of grain, with some loss to the husbandman, but which is doubly repaid by the good done him in extirpating the maggots of the chafer beetle, which in some seasons destroy whole crops of corn by feeding on the roots. The rook is a gregarious bird, sometimes being seen in immense flocks, so as almost to darken the air. These flights they regularly perform morning and evening, except in breeding time, when the daily attendance of both male and female is required for the use of incubation, or feeding the young; for they do both by turns. As they form themselves into societies, such places as they frequent during the breeding time are called rookeries; and they generally choose a large clump of the tallest trees for this purpose; but make so great a litter, and such a perpetual chattering that nothing but habit can reconcile one to the noise. The young birds are accounted good eating, especially if put in a pie.

C. GLANDARIUS, the **JAY**, is one of the most beautiful of British birds. The weight is between six and seven ounces: the length 13 inches. The forehead is white streaked with black: the head is covered with very long feathers, which it can erect at pleasure into the form of a crest; the whole neck, back, breast, belly, and covert feathers of the wings, are faint purple dashed with grey. See Plate XXXVIII.

C. MONEDULA, the **JACK-DAW**, weighs nine ounces; and is thirteen inches long and twenty-eight broad. The head is large in proportion to its body. The irides are white; the breast and belly are of a dusky hue inclining to ash colour; the rest of the plumage is black, slightly glossed with blue; the claws are very strong and hooked. It is docile and loquacious. Jack-daws breed in steeples, old castles, and high rocks, laying five or six eggs. Sometimes they breed in hollow trees near a rookery, and join those birds in their foraging parties.

C. PICA, the **MAGPIE**, is in length above eighteen inches, and weighs eight or nine ounces. The bill is black; the irides are hazel; the scapulars, and all the under parts from the breast, white; the rest of the plumage, wings, and tail, black, glossed with green, purple, and blue, in different lights. They are uncommonly beautiful birds. Mr. Latham has been able to trace this bird no farther S. than Italy, or N. than Sweden and Denmark. It is a crafty bird in every state, and if brought up young becomes exceedingly familiar, and will talk many sentences, as well as imitate every noise within hearing, like a parrot, but not so plain.

CORYBANTES, in antiquity, priests of Cybele, who danced and capered to the sound of flutes, drums, &c. See **CROTALUM**. Catullus, in his poem called *Atys*, gives a beautiful description of them, respecting them as madmen. Maximus Tyrius says, that those possessed with the spirit of the Corybantes, as soon as they heard the sound of a flute, were seized with an enthusiasm, and lost the use of their reason. And hence the Greeks used the word *κορυβαντεν*, to corybantize, to signify a person's being possessed with a devil.

CORYBANTICA, a festival held in Crete, in memory of the Corybantes, who educated Jupiter when he was concealed in that island from his father Saturn.

CORYCEUM, in antiquity, that part of the gymnasium where people undressed; called also *Apodyterium*.

CORYCOMACHIA, among the ancients, was a sort of exercise in which they pushed forwards a ball, suspended from the ceiling, and at its return either caught it with their hands, or suffered it to meet their body.

CORYLUS, the **HAZEL**: a genus of the polyandria order, and monoccia class of plants; natural order, Amentaceæ. Male calyx monophyllous, scale-like, trifid, and uniflorous; no corolla; stamina eight: female calyx diphyllous, lacerated; no corolla; two styles; an egg-shaped nut. Three species. They are all of the large shrub kind, hardy and deciduous; and have several varieties valuable for their nuts, as also for their variety in large wildernesses and shrubby work.

CORYMBIUM, in antiquity, an ornament of hair worn by the women. Its form was that of a corymbus.

CORYMBUM, in botany, a genus of the monogamia order, and syngenesia class of plants; natural order, Compositæ. Calyx diphyllous, uniflorous, prismatical; corolla monopetalous, regular. Four species are found, natives of the Cape.

CORYMBUS, [Latin,] among the ancient botanists, was used to express the bunches or clusters of berries of ivy: amongst modern botanists it is used for a compound discous flower, whose seeds are not pappous, or do not fly away in down; such are the flowers of daisies, and common marigold.

CORYNOCARPUS, in botany, a genus of the monogynia order, and pentandria class of plants. Calyx a pentaphyllous perianthium; corolla five-petaled, roundish, erect; antheræ erect, oblong; pericarpium a monospermous turbinate clavated nut. One species only is known, a native of New Zealand.

CORYPHA, **MOUNTAIN PALM**, or **UMBRELLA TREE**, in botany, a genus of plants of the order Palmæ. Corolla tripetalous; stamina six, with one pistil; fruit a monospermous plum. There are two species.

CORYPHÆNA, in ichthyology, a genus belonging to the order of thoracici. Head sloping suddenly downwards, gill-membrane with five rays; dorsal fin as long as the back. There are nineteen species, of which the principal is *C. hippuris*, the common coryphene. These fishes are commonly known by the name of dolphin, and appear in the Indian and Atlantic seas in immense numbers, frequently following in the wake of ships, and seizing with extreme rapacity whatever is thrown from them at all applicable for food. Indeed, occasionally, on their being opened, their stomachs have been found to contain hard and indigestible substances. These fish are more esteemed for beauty than delicacy of taste. They are taken on the coast of Hispaniola, Cuba, and the Bahama Islands. See Plate LV.

CORYPHÆUS, [from *κορυφή*, the top of the head,] in the ancient tragedy, was the chief or leader of the company that composed the chorus.

CORZOLA, or **CURSOLA**, an island in the gulph of Venice, divided from Ragusa in Dalmatia by a narrow strait.

COS, or **COOS**, in ancient geography, an island and town on the

the coast of Caria, in Asia, 15 miles W. of Halicarnassus, and 100 in compass, called also Meropis.

COSCINOMANCY, [from *τὸ κόσκινον*, a sieve, and *μαντεία*, divination,] the art of divination by means of a sieve.

COSCINOMANCY was used, as appears from Theocritus, to discover the secrets of known persons, as well as to find out the unknown. The sieve being suspended, after rehearsing a formula of words, it was taken between two fingers only; and the names of the parties suspected repeated: he at whose name the sieve turned, trembled, or shook, was reputed guilty of the evil in question.

COSECANT, in geometry, the secant of an arch, which is the complement of another to 90 degrees. See **TRIGONOMETRY**.

COSEIR, a town of Egypt on the coast of the Red Sea, 100 miles S. S. E. of Suez.

COSENAGE, in law, a writ that lies where the tresail, that is, the tritavus, the father of the besail, or great grandfather, being seised in fee at his death of certain lands or tenements, dies; a stranger enters, and abates; then shall his heir have this writ of cosenage; the form of which see in Fitzh. Nat. Br. folio 221.

COSENING, in law, an offence whereby any thing is done deceitfully, in or out of contracts, which cannot be fitly termed by any especial name. In the civil law it is called *stellionatus*. See **STELLIONATE**.

COSENZA, a town of Naples, the capital of Calabria Citra, 11 miles from the sea-coast.

COSEUS, a town of Asiatic Turkey, in the Arabian Irak, 80 miles S. of Bagdad.

COSIA DI DONNA, a small island near the W. coast of Sardinia.

COSINE, in geometry, the right sine of an arch, which is the complement of another to 90°. See **TRIGONOMETRY**.

COSINISSA, a small island in the Grecian Archipelago.

COSLIACO, a town of Istria, 12 miles W. of St. Veit.

COSLIN, a town of Germany, in Prussian Pomerania, 12 miles E. of Colberg.

COSMEA, in botany, a genus of the syngenesia frustranea class and order. Receptacle chaffy; seeds four-sided, with a two or four-awned crown; calyx double, each of them of one eight-parted leaf.

COSMETIC, [from *κοσμεῖν*,] any medicine or preparation which renders the skin soft and white, or helps to beautify and improve the complexion, as lip-salves, cold creams, ceruss, &c.

COSMICAL, [*κοσμικός*,] a term in astronomy, expressing one of the poetical risings of a star: thus, a star is said to rise cosmically, when it rises with the sun, or with that point of the ecliptic in which the sun is at that time: and the cosmical setting is when a star sets at the same time that the sun rises.

COSMOGONY, [*κόσμος*, and *γένεσις*,] the rise or birth of the world; the creation. A word frequently used to denote the science of the formation of the universe. In our conjectures about the formation of the world there are two principles which we ought never to lose sight of. 1. That of creation; for certainly matter could not give itself existence; it must have received it. 2. That of a supreme intelligence directing this creation, and the arrangement of the parts of matter, in consequence of which this world was formed. See **CREATION** and **EARTH**.

COSMOGRAPHY, [*κόσμος*, and *γραφία*,] the description of the world: or the science which teaches the construction, figure, disposition, and relation of all the parts of the world, with the manner of representing them on a plain. Cosmography consists chiefly of two parts: Astronomy, which shews the structure of the heavens, and the disposition of the stars; and Geography, which shews those of the earth. See these articles.

COSMOLABE, [from *κόσμος*, world, and *λαμβάνω*, I take,] an ancient mathematical instrument, serving to measure distances, both in the heavens and on earth. The cosmolabe is in great measure the same with the astrolabe.

COSMOLOGY, [from *κόσμος*, world, and *λόγος*, discourse,] the science of the world in general. This Wolfius calls general, or transcendental cosmology, and has written a treatise on the subject, wherein he endeavours to explain how the world arises from simple substances; and treats of the general principles of the mo-

difications of material things, of the elements of bodies, of the laws of motion, of the perfection of the world, and of the order and course of nature.

COSMOPOLITAN, or **COSMOPOLITE**, [*κόσμος*, and *πολίτης*,] a citizen of the world; one who is at home in every place, or who has no fixed living or place of abode.

COSNE, a town of France, in the department of Nièvre, 88 miles S. of Paris.

COSPOUR, a town of Asia, in the kingdom of Affam. Lon. 92. 57. E. Lat. 24. 56. N.

COSSACKS, a name given the people inhabiting the banks of the rivers Dnieper and Don, near the Black Sea and borders of Turkey. The word implies irregular troops of horse. These people are divided into European and Asiatic Cossacks. The first consist of the Zaporogs, who dwell below the cataract of the Dnieper, some on the side next to Russia, and others on the opposite side of the river; the lower and upper Cossacks; the Bielogorod Cossacks; and a part of the Don Cossacks. The Asiatic Cossacks are composed of the rest of the Don Cossacks, the Grebin Cossacks, the Yaik Cossacks, and the western Calmucks, who retiring from those that inhabited the south borders of Siberia under Yaiuki Can, settled upon the Wolga, and are dependent upon Russia. The Cossacks were known by that name ever since A. D. 948. They dwelt upon mount Caucasus, in the place now called Cabardy; and were reduced to the Russian dominion by prince Mastislav in the year 1021.

COSSAY, a province of Asia, in the N. of Aya.

COSSE DE GENISTE, an order of knighthood instituted in 1234, by Louis IX. at his marriage with Margaret of Provence. The motto on the collar was, *exaltat humilis*.

COSSERANS, a late province of France, forming with Foix the department of Arriege.

COSSIMBAZAR, a small city of Hindostan Proper, in Bengal, 5 miles S. of Moorshedabad. Lon. 85. 22. E. Lat. 23. 40. N.

COSTS, in law, imply the expences of a suit recovered by the plaintiff, together with damages. Costs were not allowed by the common law, the amercement of the vanquished party being his only punishment; but they are given by statute. Costs are allowed in chancery for failing to make answer to a bill exhibited, or making an insufficient answer: and if a first answer be certified by a master to be sufficient, the defendant is to pay 40s.; 3*l.* for a second insufficient answer; 4*l.* for a third, &c. But if the answer be reported good, the plaintiff shall pay the defendant 40s. costs.

COSTARD, GEORGE, a clergyman of the church of England and author of several learned works, was born about 1710; educated at Wadham college, Oxford; and took the degree of M. A. in 1733. He was first appointed curate of Islip, in Oxfordshire. He published, in 1747, some "Observations on the Book of Job," 8vo. In 1750, Two Dissertations: 1. On the meaning of the Word Kesitah, mentioned in Job, chap. xlii. ver. 11. 2. On the Signification of the Word Hermes. In 1752, he published, in 8vo. at Oxford, "Dissertationes II. Critico-Sacræ, quarum prima explicatur, Ezek. xiii. 18. Altera vero, 2 Reg. x. 22." In 1755, he wrote a letter to Dr. Birch, which is preserved in the British Museum, respecting the meaning of the phrased *sphæra barbarica*. Some time after, he published a second edition of Dr. Hyde's "Historia Religionis veterum Persarum, eorumque Magorum;" which was printed, under his inspection, and with his corrections, at the Clarendon Press at Oxford, 4to. in 1760. Mr. Costard's extensive learning having now recommended him to the notice of Lord Chancellor Northampton, he obtained, in June 1764, the vicarage of Twickenham in Middlesex; in which situation he continued till his death. In 1667, he published in one vol. 4to. "The History of Astronomy," with its application to Geography, History, and Chronology; occasionally exemplified by the Globes. This work shews, "by a gradual deduction, at what time, and by whom, the principal discoveries have been made in geography and astronomy; how each discovery has paved the way to what followed; and by what easy steps, through the revolution of many ages, these very useful sciences have advanced towards their present state of perfection." In 1778, he published in 8vo. "A Letter to Nathaniel Brassey Halhed, Esq. containing some Remarks on his Preface to the Code of Gentoo Laws."

This appears to have been the last of his publications. It contains some criticisms to invalidate the opinion which Mr. Halhed had conceived concerning the great antiquity of the Gentoo laws; and some arguments against a notion drawn from the observation of natural phenomena, that the world is far more ancient than it is represented to be by the Hebrew chronology. Mr. Costard died Jan. 10, 1782. He was a man of uncommon learning, and eminently skilled in Grecian and oriental literature. His private character was amiable, and he was much respected for his humanity and benevolence. He wrote some other works, besides several learned papers, inserted in the Philosophical Transactions, on astronomical and chronological subjects.

COSTA RICA, [*i. e.* the rich coast,] a province of New Spain, in the audience of Guatemala, so called from its rich mines of gold and silver; those of Tinsigal being preferred by the Spaniards to the mines of Potosi; but in other respects, it is mountainous and barren. It is bounded by the province of Veragua on the S. E. and that of the Nicaragua on the N. E.

COSTIVENESS, in medicine, a retention of the excrements, accompanied with an unusual hardness and dryness, so as to render the evacuations difficult, and sometimes painful. Sedentary persons are peculiarly liable to this complaint, especially those of sanguineous and choleric temperaments; or who are subject to hypochondriac affections, the gout, acute fevers, and bilious disorders. See **MEDICINE**.

COSTUME, a rule in painting, by which the artist is enjoined to make every person and thing sustain its proper character, and not only observes the story, but the circumstances, the scene of action, the country or place; and takes care that the habits, arms, manners, proportions, and the like, exactly correspond.

COSTUS, in botany, a genus of the monogynia order, and monandria class of plants; natural order, Scitamineæ. Corolla inferior, inflated, and ringent, with the other lip trifid. Four species are known, natives of the East and West Indies.

COTABAMBO, a territory of South America, in Peru, 60 miles S. W. of Cusco. It abounds in grain, fruits, and cattle. Its rich mines are now almost exhausted.

COTANGENT, in geometry, the tangent of an arch which is the complement of another of ninety degrees. See **TRIGONOMETRY**.

COTE, or **LA COTE**, one of the most beautiful, rich, and populous districts of the Helvetic republic, in the Pays de Vaud, about 15 miles long, near the lake of Geneva.

COTE, in coursing, the advantage one greyhound has over another when he runs by the side of it, and, putting before it, gives the hare a turn. See **HUNTING**.

COTE D'OR, [*i. e.* gold coast,] a department of France, bounded by those of Aube on the N. Upper Marne on the N. E. Upper Saone on the E. Jurr on the S. E. Saone and Loire on the S. and Nievre and Yonne on the W. It is chiefly formed out of the late province of Burgundy. Dijon is the capital.

COTEAUX, a town of St. Domingo.

COTE-GARE, a kind of refuse wool, so clung or clotted together that it cannot be pulled asunder.

COTERELLUS, and **COTARIUS**, according to Spelman and Du Fresne, are servile tenants; but in Doomsday and other ancient MSS. there appears a distinction, as well in their tenure and quality as in their name: for the cotarius had a free socage tenure, and paid a stated firm or rent in provisions or money, with some occasional customary services; whereas the coterellus seems to have held in mere villenage, and his person, issue, and goods, were disposable at the pleasure of the lord.

COTERIE, a term adopted from the French trading associations or partnerships, where each person advances in quota of stock, and receives his proportion of grain; and which retains its original meaning when applied to little assemblies or companies associated for mirth and good humour, where each one furnishes his quota of pleasantry.

COTES, ROGER, an excellent mathematician of the 18th century. At seventeen years of age he was admitted a pensioner of Trinity college, Cambridge. In 1706 he was appointed professor of astronomy in the professorship founded by Dr. Plume, being the first in that chair. In 1713, he published at Cambridge in 4to. a second edition of "Newton's Principia," with all the author's improvements; to which he prefixed an excellent Preface

He prepared several useful books for the public; and wrote "A Description of the Great Meteor which appeared on the 6th March 1716," published in the Philosophical Transactions. He died in the prime of his age in 1716, to the great regret of all the lovers of the sciences.

COTES DU NORD, or, **THE NORTH COASTS**, a department of France, so named from its situation; bounded on the N. by the British channel; on the E. by the department of Ille and Vilaine; and on the S. and E. by those of Morbihan and Finisterre.

COTESIAN THEOREM, in geometry, an appellation used for an elegant property of the circle discovered by Mr. Cotes. The theorem is this:

If the factors of the binomial $a \pm x^{\frac{c}{a}}$ be required, the index c

being an integer number. With the centre O, (Plate LI. fig. 2.) and radius AO = a , describe a circle, and divide its circumference into as many equal parts as there are units in $2c$, at the points A, B, C, D, &c.; then in the radius, produced if necessary, take OP = x ; and from the point P, to all the points of division in the circumference, draw the lines, PA, PB, PC, &c.; so shall these lines taken alternately be the factors sought: viz.

$$PB \times PD \times PF \&c. = a \pm x^{\frac{c}{a}}$$

and $PA \times PC \times PE \&c. = a \mp x^{\frac{c}{a}}$, viz. $a - x$, or $x - a$, according as the point P is within or without the circle.

For instance, if $c = 5$, divide the circumference into 10 equal parts, and the points being within the circle, then will

$$OA^5 + OP^5 = BP \times DP \times FP \times HP \times KP,$$

$$\text{and } OA^5 - OP^5 = AP \times CP \times EP \times GP \times IP.$$

In like manner, if $c = 6$, having divided the circumference into twelve equal parts, then will

$$OA^6 + OP^6 = BP \times DP \times FP \times HP \times KP \times MP,$$

$$OA^6 - OP^6 = AP \times CP \times EP \times GP \times IP \times LP.$$

The demonstration of this theorem may be seen in Dr. Pemberton's Epist. de Cotesii Inventis. See also Dr. Smith's Theoremata Logometrica et Trigonometrica, added to Cotes's Harm. Mens. page 114; De Moivre Miscel. Analyt. page 17; and Waring's Letter to Dr. Powell, page 39.

By means of this theorem, the author made a farther progress in the inverse method of fluxions than had been done before. But in the application of his discovery there still remained a limitation, which was removed by M. Demouivre.

COTHEN, a town of Germany in Upper Saxony, the capital of Anhalt Cothen, 12 miles S. W. of Dessau.

COTHIBEB, a town of Africa in Morocco.

COTHURNUS, the **BUSKIN**, is said to have been invented by Æschylus. See **BUSKIN**.

COTHUSE, **COTBUS**, or **COTUITZ**, a town of Germany in Lower Lusatia, 60 miles S. by E. of Berlin.

COTICE, or **COTISE**, in heraldry, is the 4th part of the bend; which with us is seldom or never borne, but in couples, with a bend between them. A bend thus bordered is said to be coticed.

COTPUTLY, a town of Hindostan, in Mewat, 8 miles S. S. W. of Delhi.

COTT, a sort of bed-frame, suspended from the beams of a ship for the officers to sleep in between the decks. It is much more convenient at sea than either the hammocks or fixed cabins; being a large piece of canvas sewed into the form of a chest, about six feet long, one deep, and from two to three wide. It is extended by a square wooden frame with a canvas bottom, equal to its length and breadth, to retain it in an horizontal position.

COTTAGE, [*cottagium*,] in law, is properly a little house for habitation without lands belonging to it; stat. 4. Edw. I. But by a latter statute, 31 Eliz. c. 7, no man may build a cottage unless he lay four acres of land thereto; unless in market-towns or cities, or within a mile of the sea, or for the habitation of labourers in mines, sailors, foresters, shepherds, &c. and cottages erected by orders of justices of peace for poor indigent people are excepted out of the statute. The four acres of land, to make it a legal cottage, must be a freehold, and land of inheritance. Four acres holden by copy, or for life or lives, or for any number of years, are not sufficient.

COTTILAH,

COTTILAH, a town of Hindostan, in Mewat; 82 miles S. of Delhi.

COTTON, [named, according to Skinner, from the down that adheres to the *mala cotonea*, or *quince*, called by the Italians *cotogni*;] in commerce, soft downy substance found on the gossypium, or cotton-tree. See **GOSSYPIMUM**. The finest sort comes from Bengal and Coromandel. Cotton makes a very considerable article in commerce, and is distinguished into cotton wool and cotton thread. Cotton wool used in Britain is brought mostly from the West India plantations: the most esteemed is white, long, and soft. Those who buy it in bales should see that it has not been wet, moisture being very prejudicial to it. Of cotton thread, that of Damas, called cotton d'ounce, and that of Jerusalem, called bazas, are the most esteemed; as also that of the West India islands. It is to be chosen white, fine, very dry, and evenly spun. The other cotton threads are the half bazas, the rames, the beledin, and gondezel; the payas and montasiri, the genequins, the baquins, the josselassars, of which there are two sorts. Cotton is separated from the seeds of the plant by a mill, and then spun and prepared for all sorts of fine works, as stockings, waistcoats, quilts, tapestry, curtains, &c. Muslin is also made of it, and sometimes it is mixed with wool, sometimes with silk, and even with gold itself. The cotton manufacture consists of various branches, and requires much machinery.

COTTON, CARDING OF, as a preparation for spinning, used formerly to be performed by the hand, with a pair of single cards upon the knee: but this being a tedious method, ill-suited to the rapid operations of the new spinning machines, other methods were contrived for affording a quicker and more adequate supply. The first improvement for this purpose was made by Mr. James Hargrave, weaver, near Blackburn, in Lancashire, and consisted in applying two or three cards to the same board, and fixing them to a stool or stock; whence they obtained the name of stock cards. With these, one woman could perform two or three times as much work as she could do before in the common way. A still more expeditious method of carding, however, by what are commonly called cylinder cards, was soon afterwards invented, and is that which is now most commonly practised.

COTTON MILLS are large buildings with peculiar machinery for carding, roving, and spinning cotton. These were entirely unknown in this country before the different inventions and improvements of Messrs. Arkwright and Hargrave; since which time great numbers have been erected in England, and several in Scotland. The first erections of the kind were by Messrs. Arkwright and Hargrave, both in the town of Nottingham, and both nearly at the same time. The engines were then driven by horses: but since that time they have been chiefly erected upon water-falls in different parts of the country; particularly the warp machines, which are better adapted for being driven by water than any other. The most extensive of these is in the village and neighbourhood of Cromford in Derbyshire, and till very lately under the immediate inspection of Sir Richard Arkwright. The first that was erected in Scotland was for Mr. Peter Brotherston, under the inspection and direction of Mr. John Hackett from Nottingham; and is in the neighbourhood of Pennycuik near Edinburgh. Since which time several have been erected in the neighbourhood of Glasgow, Paisley, Lanark, Perth, &c.

COTTON SPINNING is the art or process of reducing cotton wool into yarn or thread. The most simple method for this purpose, and the only one in use for a long time in this country, was by the hand upon the well known domestic machine called a one-thread wheel. But as the demand for cotton goods began to increase, other inventions were thought of for expediting this part of the manufacture. About 60 years ago, one Paul and others of London contrived an engine for a more easy and expeditious method of spinning cotton, and for which they obtained a patent; but the undertaking did not prove successful. Some years thereafter, various machines were constructed by different persons for facilitating the spinning of cotton; but without producing any very material or lasting advantage. At length, about 1767, Mr. Hargrave, constructed a machine by which a great number of threads (from twenty to eighty) might be spun at once, and for which he obtained his Majesty's letters patent. This machine is called a Jenny, and is the best contrivance for spinning wool or shute that has hitherto appeared. It is now commonly constructed for 84

threads; and with it one person can spin 100 English hanks in the day, each hank containing 840 yards. The most capital improvements which this branch of manufacture received were from Mr. afterwards Sir Richard Arkwright, a native of Lancashire, and long a resident at Cromford in Derbyshire. He first brought forward his new method of spinning cotton in 1768, for which he obtained a patent in 1769; he afterwards, in 1775, obtained a patent for engines which he had constructed to prepare the materials for spinning: though one of these patents, being challenged at law, was set aside some years before it expired. The result of Mr. Arkwright's different inventions and improvements is a combination of machinery, by which cotton is carded, roved, and spun, with the utmost exactness and equality; and such a degree of perfection attained in spinning warp, as is not to be equalled in any other part of the world. To these improvements this country is entirely indebted for the great extent of its cotton manufactures; large buildings have been erected for that branch both in England and Scotland, many of which contain several thousands of spindles, each driven by one or more large water-wheels; and some of such extent as to spin at the rate of 1000 yards of twist or warp yarn in the minute. Other machines have been invented at different times, and a variety of improvements made by different mechanics and manufacturers; one of which in particular we must not omit to mention. It is called a Mule, being a kind of mixture of machinery between the warp machine of Mr. Arkwright and wool machine or hand-jenny of Mr. Hargrave; and was also invented in Lancashire. This machine bids fair to be of great use in spinning cotton yarn for muslins to a degree of fineness never before known in this country, being nearly equal to those usually brought from India.

COTTON, STATE OF THE MANUFACTURE OF. The facilities which the manufacturers of Great Britain had suddenly acquired, and the immense capitals which they have so recently laid out in expensive machinery and other heavy establishments for carrying on the cotton trade, are unparalleled in the annals of the world. A multitude of cotton mills are now built in Great Britain, of which the greater part have been erected within these 30 years. Besides these, there are above 20,500 hand-mills or jennies for spinning the shute for the twisted yarn spun by the water mills. Above a million of money was, within this time, sunk in mills, hand-engines, and other machines, and a power created of working nearly two millions of spindles; and men, women, and children, were trained to this business, capable of carrying the cotton manufacture almost to any extent. In the branches applicable to muslin and calico, it was calculated that employment was given to 100,000 men and women, and at least 60,000 children. The quantity of the raw material of cotton wool consumed in this manufacture, which did not amount to 6,000,000 lb. in 1781, and was only about 11,000,000 lb. in 1784, had amounted in the year 1787 to the enormous height of 22,000,000 lb. and upwards; and the astonishing rapidity of this increase is in some measure to be attributed to the extension of these branches to the goods of India, particularly the calicoes and muslins. British calicoes were first made in Lancashire about the year 1772, but the progress was slow till within these last thirty years. The quantity manufactured has since extended from about 50,000 to 1,000,000 of pieces made in the course of a single year. British muslins were not successfully introduced until the year 1781, and were carried to no great extent until 1785, after which period the progress during two years became rapid beyond all example. The acquisition of cotton wool of a superior quality from Demerara and the Brazils, and the improvements made in the spinning fine yarns upon the mule jennies, had given a spring to this branch of the cotton manufacture, which extended it beyond what it was possible to have conceived. Not only the quantity of goods manufactured in Great Britain have increased daily with the new accession of powers, but the quality have been exceedingly improved; and a yearly supply of about 300 bales of East India cotton have been obtained, yarns spun, and muslins wove, equal to any from India. Nothing, therefore, but a fine raw material appeared wanting to enable the British manufacturer to carry this branch to the greatest extent, and the utmost perfection of which it is capable. East India cotton wool has been spun into one pound of yarn worth five guineas; and when wove into muslin, and afterwards ornamented by children in the tambour, has extended to the value of 15*l.*; yielding

ing a return of 5,900 per cent. on the raw material. But the state of the raw materials, and the progressive and astonishing increase of this manufacture, will be best understood by what follows:

	Cotton Wool used in the Manufacture.	Supposed Value when manufactured.
1781	5,101,920	L. 2,000,000
1782	11,206,810	3,900,000
1783	9,546,179	3,200,000
1784	11,280,238	3,950,000
1785	17,992,888	6,000,000
1786	19,151,867	6,500,000
1787	22,600,000	7,500,000

In June, 1796, a patent was granted to Mr. Robert Miller, calico-printer, Dumbartonshire, Scotland, for a method of weaving all kinds of cotton, linen, and worsted-cloths, by means of looms worked by water; and which may be farther facilitated by steam-engines, horses, or any other power: the weaving is performed at considerably less expence, and more expeditiously, than it can be accomplished by the hands of weavers; the cloth thus woven is of a more regular texture, and superior to that wrought by the hand. But, as this patent relates purely to a mechanical operation, solely calculated for manufacturers, we refer the reader to the eighth vol. of the "Repertory of Arts and Manufactures." Further improvements have lately been made in the manufacturing of this important article by the application of steam, &c. The utility of cotton is not merely confined to the manufacture of different cloths: it is also capable of being converted into hats and paper. Experiments have shewn, that, if raw cotton be beaten to a sufficient degree, and then reduced to a proper pulp, it will produce a smooth, strong, white paper, little inferior in texture to that commonly made of linen rags.

COTTON, Sir ROBERT, a most eminent English antiquarian, descended from an ancient family, was born in 1570. In his 18th year he began to collect ancient records, charters, and other MSS. Camden, Selden, and Speed, acknowledged their obligations to him in their respective works. He was highly distinguished by queen Elizabeth, and by James I. who created him a baronet. He wrote many things himself; but our principal obligations to him are for his valuable library, consisting of curious MSS. &c. which he was 40 years in collecting. At his death, in 1631, he left the property of it to his family, though designed for public use. A large accession was made to this library by private benefactions before the death of the founder, and afterwards by the purchases of his heirs, and donations of others, who added to it a great number of books, chiefly relating to the history and antiquities of Britain. An act of parliament was obtained, at the request of Sir John Cotton, in 1700, for preserving it after his decease, under the denomination of the Cottonian Library, for public use. It is now fixed in the British Museum. For statutes relating to it, see 12 and 13 William III. cap. 5, and 5 Anne, cap. 30.

COTTON WEED, a species of Filago.

COTTUS, the BULL-HEAD, in ichthyology, a genus of fishes of the order thoracici. Head broader than the body, spiny; eyes vertical and supplied with a nictitating membrane; gill membrane, of six rays; body round, without scales, tapering towards the tail; dorsal fins generally two. There are ten species, of which the principal is *C. gobio*, the river bull-head. This is about five inches long when full grown, is found in almost every part of Europe in clear streams, and conceals itself under a stone, or in the gravel. Its food consists of worms, aquatic insects, and extremely young fish. The mailed bull-head, or *C. cataphractus*, is found in abundance in the seas of Europe. For a representation of it see Plate LV.

COTULA, in botany, MAY-WEED; a genus of the polygamia superflua order, and syngenesia class of plants. Receptacle almost naked; pappus marginated; florets of the disc quadrifid; of the radius frequently none. There are fifteen species, all herbaceous annuals.

COTULA, or COTYLA, a liquid measure in use among the ancients. Fannius says, the cotyla was the same thing with the hemina, which was half a sextary.

COTUY, a canton and town in the Spanish part of the island of St. Domingo.

COTYLEDON. A seed consists of three parts: viz. the cotyledons, the radicle, and the plumula, which are usually inclosed in a cover. If we take a garden bean, we may perceive each of these three parts with great ease; for this seed is of so large a size, that all its organs are exceedingly distinct. When we strip off the external coats of the bean, which are two, we find that it easily divides into two lobes, pretty nearly of the same size and figure. Each of these lobes is called a cotyledon. The cotyledons of the bean, then, are two in number. See BOTANY.

COTYLEDON, NAVAL WORT; a genus of the pentagynia order, and decandria class of plants; natural order, Succulentæ. Calyx quinquefid; corolla monopetalous; there are five nectariferous scales at the base of the germ; capsules five. There are nineteen species, most of them hardy succulent perennials; natives chiefly of the Cape.

COTYLEDONES, in anatomy, are certain glandular bodies, adhering to the chorion of some animals.

COTYTIA, the festivals of Cotytto.

COTYTTO, the goddess of all debauchery. Her festivals were celebrated by the Athenians, Corinthians, Thracians, &c. during the night. Her priests were called baptæ, and nothing but debauchery and wantonness prevailed at the celebration.

COUCH, in painting, denotes a lay, or impression of colour, whether in oil or water, wherewith the painter covers his canvas, wall, wainscot, or other surface to be painted.

COUCH is also used for a lay or impression on any thing, to make it firm and consistent, or to screen it from the weather. Paintings are covered with a couch of varnish; a canvas to be painted must first have two couches of size, before the colours be laid; two or three couches of white lead are laid on wood, before the couch of gold is applied.

COUCHA-HOTUN, a town of Asia, in Thibet, 270 miles S. S. W. of Tourfan.

COUCHANT, in heraldry, is understood of a lion, or other beast, when lying down, but with his head raised; which distinguishes the posture of couchant from dormant, wherein he is supposed quite stretched out and asleep.

COUCHE, in heraldry, denotes any thing lying along: thus, chevron-couche, is a chevron lying sideways, with the two ends on each side of the shield, which should properly rest on the base.

COUCHER, or COURCHER, in our statutes, is used for a factor, or one that continues in some place or country for traffic; as formerly in Gascoigne, for the buying of wines. Anno 37 Edw. III. c. 16.

COUCHER is also used for the general book in which any religious house or corporation register their particular acts. Anno 3 and 4 Edw. VI. c. 10.

COUCHES, a town of France, in the department of Saone and Loire, 12 miles E. S. E. of Autun.

COUCHGRASS. See TRITICUM.

COUCHING OF A CATARACT, in Surgery. See SURGERY.

COUCO, a country of Africa, in Algiers, governed by an independent chief. It is mountainous, but fertile, and lies between Algiers and Boujeiah.

COUCOUR-HOTUN, a town of Thibet, 210 miles W. of Tourfan.

COVENANT, in ecclesiastical history, denotes a contract or convention agreed to by the Scots in 1638 for maintaining their religion free from innovation. In 1581, the general assembly of Scotland drew up a confession of faith, or national covenant, condemning episcopal government, under the name of hierarchy, which was signed by James I. and which he enjoined on all his subjects. It was again subscribed in 1590 and 1596. The subscription was renewed in 1638, and the subscribers engaged by oath to maintain religion in the same state as it was in 1580, and to reject all innovations introduced since that time. This oath annexed to the confession of faith received the name of the covenant: as those who subscribed to it were called covenanters.

COVENANT, in law, is the agreement of two or more persons to do, or not do, some act, or thing, contracted between them. Also it is the declaration the parties make, that they will stand to such agreement, relating to lands or other things: and is created by deed in writing, sealed and executed by the parties, or otherwise it may be implied in the contract thereto. And if the persons do

not perform their covenants, a writ or action of covenant is the remedy to recover damages for the breach of them.

COVENANT, in theology, is much used in connection with other terms; as,

1. **COVENANT OF GRACE** is that which is made between God and those who believe the gospel, whereby they declare their subjection to him, and he declares his acceptance of them and favour to them. The gospel is sometimes denominated a covenant of grace, in opposition to the Mosaic law.

2. **COVENANT OF REDEMPTION** denotes a mutual stipulation, tacit or express, between Christ and the Father, relating to the redemption of sinners by him, previous to any act on Christ's part under the character of Mediator.

3. **COVENANT OF WORKS** signifies, in the language of many divines, a covenant whereby God requires perfect obedience from his creatures, in such a manner as to make no express provision for the pardon of offences to be committed against the precepts of it, on the repentance of such supposed offenders, but pronounces a sentence of death upon them: such, they say, was the covenant made with Adam in a state of innocence, and that made with Israel at Mount Sinai.

COVENANT. See **SOLEMN LEAGUE**.

COVENANT, ARK OF THE. See **ARK**.

COVENTRY, an ancient city of England in Warwickshire, supposed to derive its name from a convent formerly situated in it. Coventry sends two members to parliament; and lies 91 miles N. W. of London. Lon. 1. 30. W. Lat. 52. 23. N.

COVERSED SINE, in geometry, the remaining part of the diameter of a circle, after the versed sine is taken from it. See **TRIGONOMETRY**.

COVERT WAY, in fortification, a space of ground level with the field, on the edge of the ditch, three or four fathoms broad, ranging quite round the half-moons, or other works toward the country. See **FORTIFICATION**.

COVERTURE, in law, is applied to the state and condition of a married woman, who is under the power of her husband, and therefore called *femme coverte*; and disabled to contract with any person to the detriment either of herself or husband, without his consent and privity; or allowance and confirmation thereof.

COUGH, in farriery. See **FARRIERY**.

COUGH, in medicine. See **MEDICINE**.

COVIN, **COVINE**, a deceitful agreement between two or more, to the hurt of another.

COUL, or **COWL**. See **COWL**.

COULAM, a town of Hindostan, on the S. coast; 15 miles N. E. of Cape Comorin.

COULONS, a town of France, in the department of Loiret, seven miles S. W. of Gien.

COULTER, in husbandry, an iron-instrument, fixed in the beam of a plough, and serving to cut the edge of each furrow. See **PLOUGH**.

COUNCIL, [*concilium*, Lat.] in church history, an assembly of prelates and doctors, met for the regulating of matters relating to the doctrine or discipline of the church. These are either National or General.

COUNCIL, COMMON, in the city of London, is a court wherein are made all by-laws which bind the citizens. It consists like the parliament, of two houses; an upper one composed of the lord mayor and aldermen; and a lower, of a number of common council men, chosen by the several wards, as representatives of the body of the citizens.

COUNCIL, NATIONAL, is an assembly of prelates of a nation under their primate or patriarch.

COUNCIL, OECUMENICAL, or GENERAL, is an assembly which represents the whole body of the universal church. The Romanists reckon 18 of them; Bullinger, in his *Treatise de Conciliis* 6; Dr. Prideaux, and bishop Beveridge 8, which, he says, are all the general councils which have ever been held since the time of the first Christian emperor. They are as follows: 1. The council of Nice, held in the reign of Constantine the Great, on account of the heresy of Arius. 2. The council of Constantinople, called under the reign and by the command of Theodosius the Great, for much the same end that the former council was summoned. 3. The council of Ephesus, convened by Theodosius the younger at the suit of Nestorius. 4. The council of Chalcedon, held in the

reign of Martianus, which approved of the Eutychian heresy. 5. The second council of Constantinople, assembled by the emperor Justinian, condemned the three chapters taken out of the book of Theodorus of Mopsuestia, having first decided that it was lawful to anathematize the dead. Some authors tell us, that they likewise condemned the several errors of Origen about the Trinity, the plurality of worlds, and pre-existence of souls. 6. The third council of Constantinople, held by the command of Constantius Pogonatus the emperor, in which they received the definitions of the five first general councils, and particularly that against Origen and Theodorus of Mopsuestia. 7. The second Nicene council. 8. The fourth council of Constantinople, assembled when Louis II. was emperor of the West. Their regulations are contained in 27 canons, the heads of which are set down by M. du Pin, to whom the reader is referred.

COUNCIL OF ANCIENTS, the senior branch of the legislative body of the French republic, according to the constitution of 1795. It consisted of 250 members; of whom 126 were to be present at a sitting before they could deliberate. Their exclusive privilege was to approve or reject the propositions of the Council of Five Hundred. No proposition of a law could originate in the Council of Ancients. Each member was to be above 40 years of age; either married or a widower; be possessed of some property, and have resided in the territory of the republic for 15 years previous to his election, unless sent out of it on the business of the nation.

COUNCIL OF FIVE HUNDRED, the junior branch of the French legislature, was invariably fixed by the constitution of 1795, to consist of 500 members. To this council belonged exclusively the privilege of proposing laws. Each member was to be 30 years of age; possessed of some real property, and must have resided within the republic for 10 years previous to his election. They could not deliberate unless 200 members were present. The members of both councils were chosen by the citizens in the electoral assemblies. One third went out annually, and their places were filled up by new members, elected between the 20th and 30th of Germinal. Old members were not to be re-elected till they had been two years out of the legislative body. Each council chose a president and secretary monthly. Both councils resided always in the same commune. This council was dissolved by Napoleon Bonaparte, Nov. 9, 1799, preparatory to his being elected first consul of the French republic.

COUNCIL OF WAR, an assembly of principal officers of an army or fleet, occasionally called by the general or admiral to concert measures for their conduct with regard to sieges, retreats, engagements, &c.

COUNCILS, KING'S. In Great Britain, the law, in order to assist the king in the discharge of his duties, the maintenance of his dignity, and the exertion of his prerogative, has assigned him a diversity of councils to advise with, viz. 1. The high court of parliament. See **PARLIAMENT**. II. The peers of the realm are by their birth hereditary counsellors of the crown; and may be called together by the king, to give their advice in all matters of importance to the realm, either in time of parliament, or, which has been their principal use, when there is no parliament. Accordingly, Bracton, speaking of the nobility of his time, says, they might properly be called "*consules a consulendo; reges enim tales sibi associant ad consulendum.*" And in the law books, it is laid down, that the peers are created for two reasons: 1. *Ad consulendum*. 2. *Ad defendendum regem*; for which reasons the law gives them certain great and high privileges; such as freedom from arrests, even when no parliament is sitting; because the law supposes that they are always assisting the king with their counsel for the common-wealth, or keeping the realm in safety by their prowess and valour. Instances of conventions of the peers, to advise the king, have been in former times very frequent; though now fallen into disuse, by reason of the more regular meetings of parliament. Sir Edward Coke gives an extract of a record, five Henry IV. concerning an exchange of lands between the king and the earl of Northumberland, wherein the value of each was agreed to be settled by advice of parliament (if any should be called before the feast of St. Lucia,) or otherwise by advice of the grand council of peers, which the king promises to assemble before the said feast, in case no parliament shall be called. Many other instances of this kind of meeting are to be found under our ancient kings, though the formal method of convoking them had been so long

left off, that when king Charles I. in 1640, issued out writs under the great seal, to call a council of all the peers of England, to meet and attend his majesty at York, previous to the meeting of the long parliament, the earl of Clarendon mentions it as a new invention, not before heard of; that is, as he explains himself, so old, that it had not been practised in some hundreds of years. But though there had not for long before been an instance, nor has there been any since, of assembling them in so solemn a manner, yet in case of emergency, our princes have at several times thought proper to call for, and consult as many of the nobility as could easily be brought together: as was particularly the case with king James II. after the landing of the prince of Orange, and with the prince of Orange himself, before he called the convention parliament which afterwards called him to the throne. Besides this general meeting, it is usually looked upon to be the right of each particular peer of the realm, to demand an audience of the king, and to lay before him with decency and respect such matters as he shall judge of importance to the public weal. And therefore, in the reign of Edward II. it was made an article of impeachment in parliament against the two Hugh Spencers, father and son, for which they were banished the kingdom, "that they by their evil covin would not suffer the great men of the realm, the king's good counsellors, to speak with the king, or to come near him; but only in presence and hearing of said Hugh the father and Hugh the son, or one of them, and at their will, and according to such things as pleased them." III. A third council belonging to the king, according to Sir Edward Coke, are his judges of the courts of law, for law matters. And this appears frequently in the English statutes, particularly 14 Edward III. c. 5, and in other books of law. So that when the king's council is mentioned generally, it must be defined, particularized, and understood, *secundum subjectam materiam*; "according to the subject matter;" and if the subject be of a legal nature, then by the king's council is understood his council for matters of law; namely, his judges. Therefore, when by statute 16 Richard II. c. 5, it was made a high offence to import into England any papal bulls, or other processes from Rome; and it was enacted, that the offenders should be attached by their bodies and brought before the king and his council to answer for such offence; here, by the expression of king's council, were understood the king's judges of his courts of justice, the subject matter being legal: this being the general way of interpreting the word council. IV. But the principal council belonging to the king is his privy council, which is generally, by way of eminence, called the council. See COUNCIL, PRIVY.

COUNCIL, PRIVY, the primum mobile of the civil government of Great Britain, bearing part of that great weight in the government which otherwise would be too heavy upon the King. It is composed of eminent persons, the number of whom is at the Sovereign's pleasure, who are bound by oath to advise the King to the best of their judgment, with all the fidelity and secrecy that becomes their station. The King may declare to, or conceal from, his privy council whatever he thinks fit, and has a select council out of their number, commonly called the cabinet council, with whom his Majesty determines such matters as are most important, and require the utmost secrecy. All proclamations from the King and the privy council, ought to be grounded on law, otherwise they are not binding to the subject. Privy counsellors, though but gentlemen, have precedence of all the knights and younger sons of barons and vicounts, and are styled right honourable.

COUNSEL, or ADVOCATES, in English courts of law, are of two species or degrees: Barristers and Serjeants. See these articles; also Advocates. From both these degrees, some are usually selected to be his majesty's counsel, learned in the law; the two principal of whom are called his attorney-general, and solicitor-general. A custom has of late years prevailed of granting letters patent of precedence to such barristers as the crown thinks proper to honour with that mark of distinction; whereby they are intitled to such rank and preaudience as are assigned in their respective patents; sometimes next after the king's attorney-general, but usually next after his majesty's counsel next being.

COUNSEL, KING'S. The first king's counsel, under the degree of serjeant, was Sir Francis Bacon, who was made so *honoris causa*, without patent or fee. The first of the modern order (who are now the sworn servants of the crown, with a standing salary) seems to have been Sir Francis North, afterwards lord keeper of the

Great Seal to king Charles II. These king's counsel answer, in some degree, to the advocates of the revenue, *advocati fisci*, among the Romans.

COUNSELLOR AT LAW, a person retained by a client to plead his cause in a public court of judicature. There are two degrees of counsel, viz. barristers and sergeants. Barristers are called to the bar after a certain period of standing in the inns of court. See BARRISTER. After 16 years standing they may be called to the degree of sergeant. The judges of the courts of Westminster are always admitted sergeants before they are advanced to the bench. From both sergeants and barristers the King's counsel are usually selected, the two principal of whom are called his attorney and solicitor-general. Counsel are supposed to plead gratis, and can maintain no action for their fees; and to encourage in them a freedom of speech in the lawful defence of their clients, a counsellor is not answerable for any matter by him spoken, though it should prove groundless, and reflect on the reputation of another; provided it relates to the cause which he espouses, and is suggested in his client's instructions. And notwithstanding counsellors have a special privilege to practise the law, yet they are punishable for misbehaviour by attachment. No counsel is allowed to a prisoner upon a general issue of indictment of felony, unless some point of law arise; for the court is the prisoner's only counsel.

COUNT, [*compte*, Fr. *computus*, Lat.] in law, denotes the original declaration in a real action; as the declaration is in a personal one; the libellus of the civilians answers to both. Yet, count and declaration are sometimes confounded, and used for each other; as count in debt, count in appeal, &c.

COUNT, [*comte*, Fr. *comes*, Lat.] a title of foreign nobility; supposed equivalent to an earl.

COUNT properly signifies a nobleman who possesses a domain erected into a county. See VISCOUNT. English and Scottish counts we distinguish by the title of earls; foreign ones still retain their proper name. The dignity of a count is a medium between that of a duke and a baron. According to the modern use, most plenipotentiaries and ambassadors assume the title of counts, though they have no county. Anciently, all generals, counsellors, judges, and secretaries of cities under Charlemagne, were called counts; the distinguishing character of a duke and a count being this, that the latter had but one town under him, but the former several. A count has a right to bear on his arms a coronet, adorned with three precious stones, and surmounted with three large pearls, whereof those in the middle and extremities of the coronet advance above the rest. The Germans call a count, *graaf*, or *graff*; which properly signifies judge; and is derived from *gravius* or *graffio*; of *graffio*, I write. They have several kinds of these counts or graffs; as landgraves, marchgraves, burg-graves, and palgraves, or counts palatine. These last are of two kinds; the former are of the number of princes, and have the investiture of a palatinate; the others have only the title of count palatine without the investiture of any palatinate. Some assert, that by publicly professing the imperial laws for 20 years, the person acquires the dignity of a count palatine; and there are instances of professors in law who have assumed the title accordingly: but there are others who question this right.

COUNT WHEEL, in the striking part of a clock, a wheel which moves round once in 12 or 24 hours. It is sometimes called the locking wheel.

COUNTER, in law, applied to deeds, means an exact copy kept by the contrary party, and sometimes signed by both parties.

COUNTER is also the name of a piece of metal with a stamp on it, used in playing at cards.

COUNTERS IN A SHIP, are two: viz.

1. COUNTER, LOWER, between the transom and the lower part of the gallery.

2. COUNTER, UPPER, the hollow arching from the gallery to the lower part of the straight piece of the stern.

COUNTER-BARRY, or *CONTRE-BARRE*, in heraldry, is the same as our bendy sinister per bend counterchanged.

COUNTER-BATTERY, is a battery raised to play upon another to dismount the guns.

COUNTER-BOND, a bond of indemnification given to one who has given his bond as a security for another's payment of a debt, or the faithful discharge of his office or trust.

COUNTER-

COUNTER-CHANGED, in heraldry, the intermixture, or opposition of any metal with a colour.

COUNTERDRAW, with painters, to copy a design or painting by means of a fine linen cloth, an oiled paper, or other transparent matter, whereon the strokes appearing through, are traced with a pencil.

COUNTER-DRAWING is sometimes done on glass, and with frames or nets divided into squares with silk or thread; and also by means of instruments invented for the purpose, as the parallelogram.

COUNTER-ERMINÉ, in heraldry, is the contrary of ermine, being a black field with white spots.

COUNTERFEITS, in law, are persons that obtain money or goods by counterfeit letters or false tokens; who being convicted before justices of assize or of the peace, &c. are to suffer such punishment as shall be thought fit to be inflicted, under death, as imprisonment, pillory, &c.

COUNTER-FLORY, in heraldry, is said of a tressure whose flowers de luce are opposite to others. See **HERALDRY**.

COUNTER-FOIL, or **COUNTER-STOCK**, in the exchequer, that part of an ally which is kept by an officer of the court.

COUNTER-GAGE, in carpentry, a method used in measuring the joints. For example, they transfer the breadth of a mortise to the place in the timber where the tenon is to be, in order to make them fit each other.

COUNTER-GUARD, in fortification, is a work raised before the point of a bastion, consisting of two long faces parallel to the faces of the bastion, making a salient angle: they are sometimes of other shapes, or otherwise situated.

COUNTER-LIGHT, or **CONTRE-JOUR**, a light opposite to any thing, which makes it appear to disadvantage. A single counter-light is sufficient to take away all the beauty of a fine painting.

COUNTERMAND, in the English law, is where a thing before executed is by some act or ceremony afterwards made void by the party that did it.

COUNTER-MARCH, in military affairs, a change of the face or wings of a battalion, by which means those that were in the front come to be in the rear.

COUNTERMARK, 1. A second or third mark put on a bale of goods belonging to several merchants, that it may not be opened but in the presence of them all. 2. The mark of the goldsmiths company, to shew the metal is standard, added to that of the artificer. 3. An artificial cavity made in the teeth of horses, that have outgrown their natural mark, to disguise their age. 4. A mark added to a medal a long time after it is struck, by which the curious know the several changes in value which it has undergone.

COUNTER-MINE, in war, a well and gallery drove and sunk till it meet the enemy's mine, to prevent its effect.

COUNTER-MURE, a wall built close to another, that it may not receive any damage from the contiguous buildings.

COUNTER-PALED, [*contre-palé*], in heraldry, is when the escutcheon is divided into twelve pales parted per fesse, the two colours being counterchanged: so that the upper are of one colour, and the lower of another.

COUNTER-PART, in music, denotes one part to be applied to another. Thus the bass is said to be a counter-part to the treble. In law, it is the duplicate or copy of any indenture or deed.

COUNTER-PASSANT, is when two lions are in a coat of arms, and the one seems to go quite the contrary way from the other.

COUNTER-PLEA, in law, a cross or contrary plea, particularly such as the defendant alleges against a tenant in courtesy, or dower, who prays the King's aid, &c. for his defence.

COUNTER-POINT, in music, the art of composing harmony, or of disposing several parts in such a manner as to make an agreeable whole or a concert. In general, every harmonious composition, or composition of many parts, is called counter-point. It took its name from hence: before notes of different measures were invented, the manner of composing was to set pricks or points one against another, to denote the several concords.

COUNTER-POINTED, in heraldry, is when two chevrons in one escutcheon meet in the points, the one rising as usual from the base, and the other inverted falling from the chief; so that they are counter to one another in the points. They may also be counter-pointed when they are founded upon the sides of the

shield, and the points meet that way, called counter-pointed in fesse.

COUNTER-POISE is a piece of metal, called by some the pear, on account of its figure, and the mass, by reason of its weight, which sliding along the beam, determines the weight of bodies weighed by the statera Romana.

COUNTER-PROOF, in rolling-press printing, a print taken off from another fresh printed; which by being passed through the press, gives the figure of the former, but inverted.

COUNTER-QUARTERED, [*contre écartelé*, Fr.] in heraldry, denotes the escutcheon, after being quartered, to have each quarter again divided into two.

COUNTER-REVOLUTION, a change of government in a country, where a revolution has already taken place; either by restoring the old government, or establishing a new one different from both. It is generally used in the former sense. This word, though in much use, especially since the commencement of the French revolution, has not hitherto found a place in any English dictionary.

COUNTER-SALIENT, in heraldry, is when two beasts are borne in a coat leaping from each other directly the contrary way.

COUNTER-SCARP, in fortification, is properly the exterior talus or slope of the ditch; but it is often taken for the covered way and the glacis. In this sense we say, the enemy have lodged themselves on the counter-scarp.

COUNTER-SCARP, ANGLE OF THE, is that made by two sides of the counter-scarp meeting before the middle of the curtain.

COUNTER-SIGNING, the signing of the writing of a superior in quality of a secretary. Thus charters are signed by the king, and countersigned by a secretary of state or lord-chancellor.

COUNTER-SWALLOW-TAIL, in fortification, an out-work in form of a single tenaille, wider at the gorge than the head.

COUNTER-TIME, in the manege, is the defence or resistance of a horse that interrupts his cadence, and the measure of his manege, occasioned either by a bad horseman, or by the malice of the horse.

COUNTER-TRIPPING, is when two beasts are borne in a coat in a walking posture, the head of the one being next the tail of the other.

COUNTER-VALLATION, in the military art, a ditch made round a besieged place, to prevent the garrison from making sallies. See **CONTRAVALLATION** and **FORTIFICATION**.

COUNTER-WORKING, the raising of works to oppose those of the enemy.

COUNTORS, **CONTOURS**, or **COUNTERS**, has been used for sergeants at law, retained to defend a cause, or to speak for their client in any court of law. They were anciently called serjeant contours.

COUNTRIES, among the miners, an appellation they give to their works under ground.

COUNTRY, among geographers, is used indifferently to denote either a kingdom, province, or less district. But its most frequent use is in contradistinction to town.

COUNTY, in geography, originally signified the territory of a count or earl, but now it is used in the same sense with shire. See **SHIRE**. England, for the better government thereof, and the more easy administration of justice, is divided into fifty-two counties, each whereof is subdivided into rapes, lathes, wapentakes, hundreds; and these again into tythings. For the execution of the laws in the several counties, excepting Cumberland, Westmoreland, and Durham, every Michaelmas term officers are appointed, called sheriffs: other officers of the several counties are lord-lieutenants, custodes rotulorum, justices of the peace, bailiffs, high constables, coroner, clerks of the market, &c. Of the fifty-two counties in England and Wales, there are four termed counties-palatine, viz. Lancaster, Chester, Durham, and Ely: these counties are reckoned among the superior courts, and are privileged as to pleas, so that no inhabitant of such counties shall be compelled by any writ to appear, or answer the same, except for error, and in cases of treason, &c. The counties palatine of Durham and Chester are by prescription, where the king's writs ought not to come, but under the seal of the counties-palatine, unless it be a writ of proclamation. There is a court of chancery in the counties-palatine of Lancaster and Durham, over which there are chancellors. Scotland is divided into thirty-three counties, the government of which is committed to sheriffs. See **SHERIFF**.

COUNTY,

COUNTY CORPORATE is a title given to several cities, or ancient boroughs, on which our monarchs have thought fit to bestow extraordinary privileges; annexing to them a particular territory, land, or jurisdiction; and making them counties of themselves, to be governed by their own sheriffs and magistrates.

COUNTY COURT, in English law, a court incident to the jurisdiction of the sheriff. It is not a court of record, but may hold pleas of debt or damages under the value of 40s. Over some of which causes these inferior courts have, by the express words of the statute of Gloucester, a jurisdiction totally exclusive of the king's superior courts. For in order to be intitled to sue an action of trespass for goods before the king's justiciars, the plaintiff is directed to make affidavit, that the cause of action does really and bona fide amount to 40s. which affidavit is now unaccountably disused, except in the court of exchequer. The statute also 43 Eliz. c. 6, which gives the judges in many personal actions, where the jury assess less damages than 40 s. a power to certify the same and abridge the plaintiff of his full costs, was also meant to prevent vexation by litigious plaintiffs; who, for purposes of mere oppression, might be inclinable to institute such suits in the superior courts for injuries of a trifling value. The county court may also hold plea of many real actions, and of all personal actions to any amount, by virtue of a special writ called justices; which is a writ empowering the sheriff for the sake of dispatch to do the same justice in his county court, as might otherwise be had at Westminster.

COVORDEN, a city of Holland, in Over-yssel; 42 miles N. E. of Deventer.

COUP-DE-MAIN, in military affairs, implies a desperate resolution in all small expeditions of surprise, &c. The favourable side of the proposed action must ever be viewed; for if what may happen, arrive, or fall out, is chiefly thought upon, it will, at the very best, not only greatly discourage, but in general it will produce a total failure. The very name of an expedition implies risk, hazard, precarious warfare, and a critical but desperate operation or coup-de-main.

COUP-D'ŒIL, in a military sense, signifies that fortunate aptitude of eye in a general or other officer, by which he is enabled at one glance on the map to see the weak parts of an enemy's country, or to discern the strong ones of his own. By possessing a ready coup-d'œil, a general may surmount the greatest difficulties, particularly in offensive operations. On a small scale this faculty is of the greatest utility. Actions have been recovered by a sudden conception of different openings upon the enemy, which could only be ascertained by a quick and ready eye, during the rapid movements of opposing armies.

COUPÉD, [from *coupé*, Fr. cut,] in heraldry, is used to express the head, or any limb, of an animal, cut off from the trunk, smooth; distinguishing it from that which is called *crassed*, that is, forcibly torn off, and therefore is ragged and uneven. It is also applied to such crosses, bars, bends, chevrons, &c. as do not touch the sides of the escutcheon, but are, as it were, cut off from them.

COUPEE, POINT, a Spanish settlement of N. America, extending 20 miles on the west side of the Mississippi.

COUPLE-CLOSS, in heraldry, the 4th part of a chevron, never borne but in pairs, except there be a chevron between them, saith Guillim, though Bloom gives an instance to the contrary.

COUPTRAIN, a town of France, in the department of Maine, $7\frac{1}{2}$ miles N. of Vitaine.

COUR, a town of France, in the department of Loire and Cher, 9 miles S. of Blois.

COURA, a river of Portugal, which runs into the Duero, four miles N. E. of Lamego.

COURAGE, in ethics, is that quality of the mind, derived either from constitution or principle, or both, that enables men to encounter difficulties and dangers. See **FORTITUDE**.

COURANT, in music, is a piece in triple time: the air of the courant is ordinarily noted in triples of minims; the parts to be repeated twice. It begins and ends when he who beats the measure falls his hand; in contradistinction from the saraband, which ordinarily ends when the hand is raised.

COURAP, a general name in the East-Indies for any sort of itch; but particularly applied to a species very common in Java and some other parts.

COURSÉ, a post of Chinese Tartary.

COURGIS, a town of France, in the department of Yonne, 5 miles E. of Auxerre.

COURGIVAUX, a town of France, in the department of Marne, 10 miles W. S. W. of Sezanne.

COURLAND, a duchy of Europe, situated between 51° and 60° Lon. E. and between $56^{\circ} 30'$ and $57^{\circ} 30'$ Lat. N. It is bounded by the gulph of Riga and the river Dwina, which divide it from Livonia, on the N.; by Lithuania, on the E.; by Samogitia, on the S.; and by the Baltic sea on the W.; being 250 miles long and 40 broad. This duchy was formerly independent, and elected their own duke; but is now subject to Russia. This country rises in gentle hills, and is fertile in corn, hemp, and flax. It also abounds in pines, firs, oaks, &c. and has many neat villages and good inns. It is divided into Courland Proper and Semigallia. The chief towns are Mittau the capital, Candau, Golden-gen, Groben, Libau, and Winday.

COURSE, in navigation, that point of the compass, or horizon, on which the ship steers; or the angle between the rhumb-line and the meridian. See **NAVIGATION**.

COURSE, in architecture, a continued range of stones, level, or of the same height throughout the whole length of the building, without being interrupted by any aperture.

COURSE OF PLINTHS, the continuity of a plinth of stone, or plaister, in the face of a building, to mark the separation of the stones.

COURSES, in a ship, the mainsail and foresail: when the ship sails under them only, without lacing on any bonnets, she is then said to go under a pair of courses. To sail under a main course and bonnets, is to sail under a mainsail and bonnet.

COURSE is used for a collection or body of laws, canons, or the like. As, the civil course is the collection of the Roman law compiled by order of Justinian: canonical course, the collection of the canon law, made by Gratian. See the articles **CIVIL-LAW** and **CANON-LAW**.

COURSE is also made to express the elements of an art, explained either by experiment or writing.

COURSE is also applied for the time spent in learning the elements of a science; as a student is said to go through his courses of philosophy, divinity, mathematics, &c. at the university.

COURT, [*curia*, Lat.] in a law sense, the place where judges distribute justice, or exercise jurisdiction; also the assembly of judges, jury, &c. in that place. As by our excellent constitution, the sole executive power of the laws is vested in the person of the king, it follows that all courts of justice, which are the medium by which he administers the laws, are derived from the power of the crown. For whether created by act of parliament or letters patent, or subsisting by prescription, (the only methods by which any court of judicature can exist,) the king's consent in the two former is expressly, and in the latter impliedly, given. In all these courts, the king is supposed in contemplation of law to be always present; but as that is in fact impossible, he is there represented by his judges, whose power is only an emanation of the royal prerogative. For the more speedy, universal, and impartial administration of justice between subject and subject, the law has appointed a great variety of courts, some with a more limited, others with a more extensive jurisdiction; some constituted to inquire only, others to hear and determine; some to determine in the first instance, others upon appeal and by way of review. See **LAW**, and the respective articles in the order of the alphabet. One distinction runs throughout them all; viz. that some of them are courts of record, others not of record. A court of record is that where the acts and judicial proceedings are enrolled in parchment for a perpetual memorial and testimony: which rolls are called the records of the court, and are of such high and super-eminent authority, that their truth is not to be called in question. For it is a settled rule and maxim, that nothing shall be averred against a record, nor shall any plea, or even proof, be admitted to the contrary. And if the existence of a record be denied, it shall be tried by nothing but itself; that is, upon bare inspection, whether there be any such record or no; else there would be no end of disputes. But if there appear any mistake of the clerk in making up such record, the court will direct him to amend it. All courts of record are the king's courts, in right of his crown and royal dignity, and therefore no other court hath authority to fine

or imprison; so that the very erection of a new jurisdiction with power of fine or imprisonment, makes it instantly a court of record. A court not of record is the court of a private man; whom the law will not intrust with any discretionary power over the fortune or liberty of his fellow-subjects. Such are the courts baron, and other inferior jurisdictions: where the proceedings are not enrolled or recorded; but as well their existence as the truth of the matters therein contained shall, if disputed, be tried and determined by a jury. These courts can hold no plea of matters cognizable by the common law, unless under the value of 40s. nor of any forcible injury whatsoever, nor having any process to arrest the person of the defendant. In every court there must be at least three constituent parts, the actor, reus, and judex: the actor, or plaintiff, who complains of an injury done; the reus, or defendant, who is called upon to make satisfaction for it; and the judex, or judicial power, which is to examine the truth of the fact, to determine the law arising upon that fact, and, if any injury appears to have been done, to ascertain, and by its officers to apply the remedy. It is also usual in the superior courts to have attorneys, and advocates or counsel, as assistants. See ATTORNEY, and COUNSEL.

COURT, ARCHES. See ARCHES COURT.

COURT BARON, in English law, a court incident to every manor in the kingdom, to be holden by the steward within the said manor. This court baron is of two natures: the one is a customary court, appertaining entirely to the copyholders, in which their estates are transferred by surrender and admittance, and other matters transacted relative to their tenures only. The other is a court of common law, and it is the court of the barons, by which name the freeholders were called: for that it is held before the freeholders who owe suit and service to the manor, the steward being rather the registrar than the judge. These courts, though in their nature distinct, are confounded together.

COURTS, ECCLESIASTICAL, are those courts which are held by the king's authority, as supreme governor of the church, for matters which chiefly concern religion. As to suits in spiritual or ecclesiastical courts, they are for the reformation of manners; as for the punishing of heresy, defamation, laying violent hands on a clerk, and the like; and some of their suits are to recover something demanded, as tithes, a legacy, contract of marriage, &c.; and in cases of this nature, the court may give costs, but not damages. The proceedings in the ecclesiastical courts are according to the civil and canon law: they are not courts of record.

COURT OF CONSCIENCE, a court in the cities of London, Westminster, and some other places, that determines matters in all cases, where the debt or damage is under forty shillings.

COURT OF DELEGATES, a court where delegates are appointed by the king's commission, under the great seal, upon an appeal to him from the sentence of an archbishop, &c. in ecclesiastical causes; or of the court of admiralty, in any marine cause.

COURT OF HUSTINGS, a court of record held at Guildhall, for the city of London, before the lord mayor and aldermen, sheriffs, and recorder, where all pleas, real, personal, and mixt, are determined; where all lands, tenements, &c. within the said city, or its bounds, are pleadable in two hustings; the one called the hustings of plea of lands, and the other the hustings of common pleas. The court of hustings is the highest court within the city, in which writs of exigent may be taken out, and out-lawries awarded, wherein judgement is given by the recorder. To the lord mayor and city of London belong several other courts, as the court of common-council, consisting of two houses, the one for the lord mayor and aldermen, and the other for the commoners; in which court are made all by-laws which bind the citizens. The chamberlain's court relates to the rents and revenues of the city, to the affairs of servants, &c. See CHAMBERLAIN. To the lord mayor belongs the court of coroner and escheator; another court for the conversation of the river of Thames; another of gaol delivery, held eight times a year at the Old Bailey, for the trial of criminals, where the lord mayor himself is the chief judge. There are also other courts called ward-motes, or meeting of the wards; and courts of holymote, or assemblies of the guilds and fraternities.

COURT-LEET, a court ordained for the punishment of offences under high treason against the crown.

COURT-MARTIAL, a court appointed for the punishing of offences in officers, soldiers, and sailors, the powers of which is regulated by the mutiny-bill.

VOL. II.—No. 59.

COURT OF PIEPOWDER, a court held in fairs to do justice to buyers and sellers, and for redress of disorders committed in them; so called because they are most usual in summer, when the suitors to the court have dusty feet. The court of piepowder may hold plea of a sum above 40s. The steward before whom the court is held is the judge, and the trial is by merchants and traders in the fair; and the judgement against the defendant shall be, quod amercietur. If the steward proceeds contrary to the statute 17 Edw. IV. he shall forfeit 5*l*.

COURT OF REQUESTS, was a court of equity, of the same nature with the chancery, but inferior to it. It was chiefly instituted for the relief of such petitioners as in conscionable cases addressed themselves to his majesty: the lord privy-seal was the chief judge of this court.

COURTENAY, a town of France, in the department of Loiret, 13½ miles S.W. of Sens.

COURTESY, or **CURTESY OF ENGLAND**, a certain tenure, whereby a man marrying an heiress seized of lands of fee simple, or fee tail general, or seised as heir of the tail special, and hath a child by her that cometh alive into the world, though both it and his wife die forthwith; yet if she were in possession, he shall keep the land during his life, and is called tenant per legem Angliæ, or tenant by the courtesy of England; because this privilege is not allowed in any country except Scotland, where it is called curialitas Scotiae.

COURTHEZON, a town of France, in the department of the Mouths of the Rhone.

COURTINE. See CURTIN, and FORTIFICATION.

COURT-OF-ALDERMEN, a cluster of small islands, in the S. and N. Pacific Ocean, off the coast of New Zealand.

COURTRAI, or **COURTRAY**, a town of France in the department of Lys, 24 miles S. of Bruges.

COUSIN, is a term of relation between the children of brothers and sisters, who, in the first generation, are called cousins-german; in the second generation, second cousins, &c. Theodosius the Great prohibited cousins from marrying, under pain of death; on pretence that they were, in some sort, brothers and sisters to each other.

COUSU, in heraldry, signifies a piece of another colour or metal placed in the ordinary, as if it were sewed on, as the word imports.

COUTAHOU, a town of Asia, in Thibet, 25 miles E. of Manas-Hotun.

COUTANCES, a city of France, in the department of the Channel, 40 miles S. of Cherbourg. Lon. 1. 23. W. Lat. 49. 3. N.

COUTANTIN, **COTANTIN**, or **COTENTIN**, a late territory of France, in Lower Normandy; containing the towns of Coutances, Carentan, Cherbourg, Barileur, Granville, St. Saviour, Valogne, Ville-Dieu, &c. It is now included in the department of the Channel.

COUTCHING, a town of China, in Petcheli.

COU-TCHING-KEON, an island of China.

COUTOUCTOU-HOTUN, a town of Chinese Tartary, 225 miles E. of Pekin.

COUTRAS, a town of France, in the department of Dordogne, 20 miles N.E. of Bourdeaux.

COUVERT, in heraldry, a piece of hanging, or a pavilion falling over the top of a chief or other ordinary, so as not to hide, but only to be a covering to it.

COUXEA, a town of Africa, on the coast of Guinea, in Sierra Leone.

COW, in zoology. See BOS.

Cow, SEA. See TRICHECUS.

Cow and CALF, two rocks of Ireland, off the S.E. coast of the county of Down.

COWBRIDGE, a town of S. Wales, in Glamorganshire, where the county assizes are held. It is 12 miles W. of Cardiff, 63 W. by N. of Gloucester.

COWE, the capital of the Cherokee Indians, situated on the foot of the hills, on both sides the river Tennessee.

COWEL DR. JOHN, a learned and eminent civilian, born about 1554. In 1607, he compiled a Law Dictionary, which gave great offence to Sir Edward Coke and the common lawyers: so that they first accused him to James I. as asserting that the king's prerogative was in some cases limited; and when they failed in that attempt, they complained of him to the house of commons.

as a betrayer of the rights of the people, by asserting that the king was not bound by the laws; for which he was committed to custody, and his book publicly burnt. He also published "*Institutiones Juris Anglicani*," in the manner of Justinian's *Institutes*; and died of the operation for the stone, in 1611.

COWES, EAST, and COWES WEST, two towns on the N.E. coast of the Isle of Wight.

COWLS, habits worn by the Bernardines and Benedictines; they are of two kinds; the one white, very large, worn in ceremony, and when they assist at the office; the other black, worn on ordinary occasions, in the streets, &c. F. Mabillon maintains that the cowl was the same thing in its origin with the scapular. The author of the apology of the Emperor Henry IV. distinguishes two forms of cowls: the one a gown reaching to the feet, having sleeves, and a capuchin, used in ceremonies; the other a kind of hood to work in, called also a scapular, because it only covers the head and shoulders.

COWLEY, ABRAHAM, an English poet, was born in London in 1618, and educated at Westminster school. At the age of 15 he published a small collection of poems, entitled *Poetical Blossoms*. From Westminster he removed to Trinity college, Cambridge, where he wrote several of his pieces. In 1643 he was ejected from the college for his loyalty, and then went to Oxford, where he materially served the royal cause. He afterwards removed to France in the family of the earl of St. Albans. In 1656 he returned to England, and was soon after committed to prison, from whence he was bailed by Dr. Scarborough. Next year he went to Oxford, and obtained the degree of M.D. On the death of Cromwell he again visited France, but returned at the Restoration, and obtained a lease of a farm at Chertsey, valued about 300*l.* a year, where he died in 1667. His remains were deposited in Westminster abbey, where is a monument to his memory. Dr. Johnson places Cowley at the head of those whom he calls metaphysical poets; but though he is sometimes sublime, always moral, and frequently witty, yet his poems are tedious and affected. The anacreontics are reckoned the best. He also wrote a comedy called the *Cutter of Colman-street*, and some pieces in prose, particularly a *Discourse on the Government of Cromwell*, and a *Proposition for the Advancement of Experimental Philosophy*.

COWPER, WILLIAM, an excellent English poet, son of Dr. Cowper, chaplain to George II. rector of Berkhamstead in Herefordshire. He was born in 1731, at Berkhamstead, and lost his mother when he was only six years old. His constitution was very delicate from his infancy. He received the rudiments of learning at Market-street, Hertfordshire, from whence he was removed to Westminster school, which he quitted at the age of eighteen. After finishing his studies for the law at the age of thirty-one, he was nominated a clerk in the house of lords; but an unconquerable timidity prevented him from taking it. He was next appointed clerk of the journals; but an occasion occurring which rendered it necessary for him to appear at the bar of the house, it had such an effect on his nerves, that he was obliged to resign the place. In 1765 he settled at Huntingdon, where he formed an acquaintance with a clergyman of the name of Unwin, in whose family he became an inmate. That gentleman being killed by a fall from his horse in 1767, Cowper and Mrs. Unwin went and settled at Olney in Buckinghamshire, where they contracted an intimacy with Mr. Newton, then curate of that parish, and well known as a popular preacher, and calvinistic writer. To a collection of hymns published by that gentleman, our poet contributed 68. In 1782 appeared a volume of his poems, which did not excite much attention; but the second volume, in 1785, stamped his reputation as a first-rate poet, particularly by that exquisite piece "*The Task*." Lady Austin, for whom the poet had a tender regard, being a great admirer of Milton, requested him to try his powers in blank verse; and, on his asking her for a subject, she said, "Oh, you can write upon any; let it be this sofa." Thus originated one of the finest poems in our language. The same lady was also the occasion of the popular ballad of John Gilpin, which story she related to amuse Cowper in one of his gloomy moments; and it had such an effect upon him, that he turned it into verse. About this time he engaged in translating Homer into Miltonic verse; and though the version is not so pleasing as that of Pope, it exhibits more of the original. In 1786 he removed to Weston in Northamptonshire, with Mrs. Unwin, whom he regarded as a mother. In 1794 his majesty granted him a pension of 300*l.* per annum, but the royal

bounty yielded pleasure only to his friends, for he was now sunk into a state of complete dejection, from which he never fully emerged. He continued, however, occasionally to write, and also finished a revival of his *Homer*, which has since been printed. This amiable man, and extraordinary genius, died at Dereham, in Norfolk, April 25, 1800.

COWSLIP. See *PRIMULA*.

COWS-LUNGWORT. See *VERBASCUM*.

COW-WEED. See *CHELOPHYLLUM*.

COW-WHEAT. See *MELAMPYRUM*.

COXWOLD, a town in the North riding of Yorkshire, 14 miles N. of York.

COYAU, a settlement of the United States, on the river Tennessee, 30 miles below Knoxville.

COYPEL, a celebrated family of painters in France. 1. Noel Coypel was born in 1628, and became the disciple of Quilletier. The king gave him apartments in the Louvre, and nominated him director of the French academy at Rome, which institution flourished greatly under his care. He executed a number of excellent works, and died in 1707. 2. Anthony Coypel, eldest son of the above, was born at Paris in 1661. He accompanied his father to Rome, where he greatly improved himself. He succeeded his father in his honours, and in 1715 was appointed first painter to the king. To his professional talents he added a taste for literature, and wrote a poetical epistle on painting in a style of elegance. He died in 1722. 3. His son Charles was an eminent artist, and a dramatic poet. He died in 1752, aged 58. 4. Noel Nicholas Coypel, another son of Noel Coypel, and brother of Antony, was born at Paris in 1692. His father dying while he was young, he lost several advantages of instruction; but he acquired great knowledge by his own application, and produced a picture for a royal prize, which was highly admired. He also painted some fine church pieces. In 1733 he was appointed a professor in the academy, and died in 1735.

COZUMEL, an island near the west coast of Yucatan, where Cortez landed and refreshed his troops before entering upon the conquest of Mexico.

CRAB, in zoology. See *CANCER*.

CRAB, an engine of wood, with three claws, placed on the ground like a capstan, and used on launching or heaving ships into the dock. See Plate XLVII. fig. 15.

CRAB'S CLAWS. See *MATERIA MEDICA*.

CRAB'S EYES. See *MATERIA MEDICA*.

CRAB, or GIN, an engine used for mounting large guns on their carriages, &c. It is composed of three long and stout legs, meeting together at their tops; these legs are round poles of about 12 or 13 feet long, whose diameters at the lower end are about four inches, five just below the roller besides the cheeks that are added to them in that place, and about three inches and a half above.

CRACATOA, the most southern of a cluster of islands lying in the entrance of the Straits of Sunda in the East Indies.

CRACOVIA, or CRACOW, a palatinate of Poland, bounded on the N. by Siradia, on the S. by Hungary; and on the W. by Silesia. The principal towns are Cracow, and Landscom.

CRACOW, or CRACKOW, situated in the above-mentioned palatinate, was built by Cracus I. king of Poland, and was formerly the capital where the kings were elected and crowned.

CRADLE, a well-known machine in which infants are rocked to sleep. It denotes also that part of the stock of a cross-bow where the bullet is put.

CRADLE, in surgery, a case in which a broken leg is laid after being set.

CRADLE, among shipwrights, a timber frame made along the outside of a ship by the bilge, for the convenience of launching her with ease and safety. See Plate XLVII. fig. 16.

CRAFT, in the sea-language, signifies all manner of nets, lines, hooks, &c. used in fishing. Hence all such little vessels, as ketches, hoys, and smacks, &c. used in the fishing trade, are called small craft.

CRALIOVA VELIKA, a town of Sclavonia, 52 miles E. of Carlsstadt.

CRAMBE, SEA CABBAGE, SEA BEACH KALE, or SEA COLEWORT, in botany, a genus of the siliquosa order, and tetradynamia class of plants; natural order, siliquosæ. Filaments, the four longer forked at top, with one anthera at the end of each; the fruit a dry, globose, and deciduous berry. There are six species, all

all herbaceous esculents with perennial roots, producing annually large leaves resembling those of cabbage spreading on the ground, with strong flower-stalks and yellowish flowers.

CRAMP, in medicine, a convulsive contraction of a muscular part of the body, being either natural, as in convulsive constitutions, or accidental, from living in cold places, under ground, &c. It affects all parts indifferently, but the ham, calves, feet, and toes, oftener than the arms and hands: it is seldom mortal, though its returns are often quick, and continuance long, with great pain and distension of some vessels, as appears from the knots and ganglions it occasions. If it be natural, observe the cure as in an epilepsy or convulsions; if accidental, it is removed by rubbing the part affected. To prevent the cramp in the calves of the legs, stretch out the heel as far as possible, at the same time drawing up the toes towards the body.

CRAMP FISH, or **TORPEDO**. See **RAJA**.

CRAMPONEE, in heraldry, an epithet given to a cross which has at each end a cramp or square piece coming from it; that from the arm in chief towards the sinister angle, that from the arm on that side downwards, that from the arm in base towards the dexter side, and from the dexter arm upwards.

CRAN-BERRY. See **VACCINIUM**.

CRANBERRY, in geography, a thriving town of New Jersey, in Middlesex county, 16 miles S. S. W. of Brunswick.

CRANBERRY ISLANDS, two islands of the United States. on the coast of the district of Maine.

CRANBOURN, or **CRANBURN**, a town of Dorsetshire, on the borders of Hampshire.

CRANBROOK, a town in Kent, 13 miles S. of Maidstone, and 52 S. E. of London.

CRANE, in ornithology. See **ARDEA**.

CRANE, in mechanics. See **MECHANICS**, (Art. 19.)

CRANGANORE, a town of Hindostan on the coast of Malabar, 58 miles S. S. W. of Calicut.

CRANICHIS, in botany, a genus of the gynandria diandria class and order. Natural order orchideæ. Nectary galeated. There are five species, all natives of Jamaica.

CRANIOLARIA, in botany, a genus of the didynamia angiospermia class and order. Natural order Personatæ. Calyx double of the flower; perianth four-leaved; spathe one-leaved; corolla tube very long. One species, viz. *C. annua*, found in the neighbourhood of Carthage in New Spain.

CRANIUM. See **ANATOMY**. The word comes from the Greek *κράνιον*, of *κράνιον*, *galea*, a helmet; because it serves to defend the brain like a head-piece.

CRANK, a contrivance in machines, in manner of an elbow, only of a square form, projecting from a spindle, and serving by its rotation to raise and fall the pistons of engines.

CRANK likewise denotes the iron support for a lantern, and also the iron made fast to a stock of a bell for ringing it. In the sea-language, a ship is said to be crank-sided when she can bear but small sail, for fear of oversetting; and when a ship cannot be brought on the ground without danger, she is said to be crank by the ground.

CRANMER, THOMAS, a celebrated archbishop, reformer, and martyr, was the son of Thomas Cranmer, Esq. of Aslacton in Nottinghamshire, where he was born in 1489. At the age of 14, he was admitted a student of Jesus' College, Cambridge, of which he afterwards became fellow; but marrying the relation of an inn-keeper's wife, he lost his fellowship and quitted the college. On the death of his wife, he was readmitted fellow of Jesus' college. In 1523, he took the degree of D. D. and was made theological lecturer and examiner. The plague being at Cambridge, he retired to the house of a relation at Waltham Abbey, where meeting with Fox the king's almoner, and Gardener the secretary, he gave his opinion concerning the king's marriage with Catherine much to the satisfaction of Henry. This opinion was, that instead of disputing about the validity of the king's marriage with Catharine, they should reduce the matter to this simple question, "Whether a man may marry his brother's wife or not?" When the king was told of it, he said, "This fellow has got the right sow by the ear." He then sent for him to court, made him one of his chaplains, and ordered him to write in vindication of the divorce in agitation. This book having quieted the king's tender conscience, he was desirous that all Europe should be convinced of the illegality of his marriage with Queen Catharine; and for that purpose

sent Cranmer to France, Italy, and Germany, to dispute the matter with the divines of those countries. At Nuremberg Cranmer married a second wife. Being returned to England, in March 1533, he was consecrated Abp. of Canterbury; in May following he pronounced the sentence of divorce between the king and queen; and soon after married the amorous monarch to Anna Boleyn. Being now at the head of the church, he exerted himself in the business of the Reformation. The Bible was translated into English, and monasteries were dissolved principally by his means. In 1536, the royal conscience again requiring his assistance, he divorced the king from Anna Boleyn. In 1537, he visited his diocese, and endeavoured to abolish the superstitious observation of holidays. In 1539, he and some of the bishops fell under the king's displeasure, because they would not give their consent in parliament that the monasteries should be suppressed for the king's sole use. He also strenuously opposed the act for the six articles in the house of lords, speaking three days against it: and upon its passing, sent away his wife into Germany. In 1540, he was one of the commissioners for inspecting into matters of religion, and explaining some of its chief doctrines. The result of their commission was the book intitled "A necessary Erudition of any Christian man. After Lord Cromwell's death, (in whose behalf he had written to the king,) he retired and lived in great privacy, not meddling with state affairs. In 1541, he gave orders for taking away superstitious shrines; and, exchanging Bishopsbourn for Bekebourn, united the latter to his diocese. In 1542, he procured the "Act for the Advancement of true Religion, and the Abolishment of the Contrary," which moderated the rigour of the six articles. The king continued afterwards to protect him from his enemies; and at his death appointed him one of the executors of his will, and one of the regents of the kingdom. In 1546, he crowned Edward VI. during whose short reign he promoted the reformation to the utmost of his power; and was particularly instrumental in composing, correcting, and establishing the liturgy by act of parliament. He had also a share in compiling the 39 articles. In 1553, he opposed the settlement of the crown upon Lady Jane Gray, though at last, through importunity, he was prevailed upon to set his hand to it. Upon Queen Mary's accession, he was committed to the tower; partly for setting his hand to the instrument of Lady Jane's succession, and partly for the public offer he had made of justifying openly the religious proceedings of the late king. Some of his friends, foreseeing the storm that was likely to fall upon him, advised him to fly, but he refused. In the ensuing parliament, Nov. 3, he was attainted, and at Guildhall found guilty of high treason; whereupon the fruits of his archbishopric were sequestered. In April, 1554, he with Ridley and Latimer were removed to Oxford, for a public disputation with the Papists; which was held there towards the middle of the month, with great noise, triumph, and impudent confidence on the Papists side, and with as much gravity, learning, modesty, and convincing sufficiency, on the side of the Protestant bishops. The 20th of April, two days after the end of these disputations, Cranmer and the two others were brought before the commissioners, and asked, whether they would subscribe (to Popery): which they unanimously refusing, were condemned as heretics. From this sentence the archbishop appealed to the just judgement of the Almighty, and wrote to the council giving them an account of the disputation, and desiring the queen's pardon for his treason, which it seems was not yet remitted. By the convocation which met this year, his Defence of the true and Catholic Doctrine of the Sacrament of the Body and Blood of our Saviour Christ, was ordered to be burnt. Some of his friends petitioned the queen in his behalf; putting her in mind how he had once preserved her in her father's time, by his earnest intercessions with him for her. All solicitations, however, were ineffectual; and the archbishop being degraded, and most ignominiously treated, was at last flattered and terrified into an insincere recantation and renunciation of the Protestant faith. But this triumph was not sufficient to gratify the pious vengeance of the Romish Mary. On the 24th of Feb. 1556, a writ was signed for the burning of Cranmer; and on the 24th of March, which was the fatal day, he was brought to St. Mary's church, Cambridge, and placed on a kind of stage over against the pulpit, where Dr. Cole was appointed to preach a sermon on the occasion. While Cole was haranguing, Cranmer expressed great inward confusion; often lifting up his hands and eyes to heaven, and frequently shedding tears. At the end of the sermon, when Cole desired him to make

an open profession of his faith, as he had promised him he would, he first prayed in the most fervent manner; then made an exhortation to the people present, not to set their minds upon the world, to love each other, and to be charitable. After this he made a confession of his faith, beginning with the creed, and concluding with these words: "And I believe every word and sentence taught by our Saviour Jesus Christ, his apostles, and prophets, in the Old and New Testament. And now (added he) I come to the great thing, that so much troubleth my conscience more than any thing I ever did, or said, in my whole life; and that is the setting abroad a writing contrary to the truth, which I here now renounce, as things written with my hand contrary to the truth which I thought in my heart; and written for fear of death, and to save my life if it might be: that is, all such bills and papers which I have written, or signed with my hand since my degradation, wherein I have written many things untrue. And forasmuch as my hand offended, writing contrary to my heart, my hand shall first be punished; for, may I come to the fire, it shall be first burned. As for the pope, I refuse him, as Christ's enemy and antichrist, with all his false doctrine. And as for the sacrament, I believe as I have taught in my book against the Bishop of Winchester." Thunder-struck with this unexpected declaration, the enraged Popish crowd admonished him not to dissemble. "Ah! (replied he) since I lived hitherto, I have been a hater of falsehood, and a lover of simplicity, and never before this time have I dissembled." Whereupon they pulled him off the stage with the utmost fury, and hurried him to the place of his martyrdom over against Balliol College; where he put off his clothes in haste, and standing in his shirt, and without shoes, was fastened with a chain to the stake. Some pressing him to agree to his former recantation, he answered, shewing his hand, "This is the hand that wrote it, and therefore it shall first suffer punishment." Fire being applied to him, he stretched out his right hand into the flame, and held it there unmoved (except that once with it he wiped his face) till it was consumed; crying with a loud voice, "This hand hath offended; and often repeating, "This unworthy right hand." At last, the fire getting up, he soon expired, never stirring or crying out; only keeping his eyes fixed to heaven, and repeating more than once, "Lord Jesus, receive my spirit." Such was the end of the renowned Thomas Cranmer, in the 67th year of his age. Abp. Cranmer wrote a great number of books: many of them he published himself; and many of them still remain in MS. viz. two folio volumes in the king's library, several letters in the Cottonian Library, &c.

CRANNY, in glass-making, an iron instrument wherewith the necks of glasses are formed.

CRANSAC, a town of France, in the department of Aveiron, 15 miles N. W. of Rhodés.

CRANTARA, among the ancient Britons, was a sort of military signal used for collecting the distant and scattered warriors to the standard of their chief.

CRAON, a town of France, in the department and late province of Maine.

CRANZIA, in botany, a genus of the pentandria monogynia class and order. Calyx five-parted; petals five; nectary none; capsule, berried. There is but one species, viz. *C. aculeata*, a prickly shrub; native of the East Indies.

CRAPE, in commerce, a kind of stuff made in the manner of gauze, with raw silk, gummed and twisted on the mill.

CRASIS, [*κράσις*,] temperature; constitution arising from the various properties of humours.

CRASIS, in grammar. See **SYNÆRESIS**.

CRASPEDIA, a genus of the class and order syngenesia polygamia segregata. Calyx imbricate; florets in depressed bundles; down feathered; receptacle chaffy. There is one species, a native of New Zealand.

CRASSULA, **LESSER ORFINE**, in botany, a genus of the pentandria pentagynia class and order. Natural order Succulentæ. Calyx one-leaved, five-cleft; petals five; nectareous scales five at the base of the germ; capsule five, many-seeded. There are sixty-four species.

CRASSUS, **M. LICINIUS**, a celebrated Roman, surnamed the Rich on account of his opulence. At first he was very circumscribed in his circumstances, but by educating slaves, and selling them at a high price, he soon enriched himself. When the Gladiators with Spartacus at their head had spread an universal alarm

in Italy and defeated some of the Roman generals, Crassus was sent against them. A battle was fought, in which Crassus slaughtered 12,000 of the slaves, put an end to the war, and was honoured with an ovation at his return. He was soon after made consul with Pompey, A. U. C. 682, and in this high office he displayed his opulence, by entertaining the populace at 10,000 tables. He was afterwards Censor, and formed the first triumvirate with Pompey and Cæsar. As his love of riches was more predominant than that of glory, Crassus never imitated the ambitious conduct of his colleagues, but was satisfied with the province of Syria, which promised an inexhaustible source of wealth. With hopes of enlarging his possessions he set off from Rome, though the omens proved unfavourable, and every thing seemed to threaten his ruin. He crossed the Euphrates, and hastened to make himself master of Parthia. He was betrayed in his march by the delay of Artavasdes, king of Armenia, and the perfidy of Ariamnes. He was met in a large plain by Surena the Parthian general, and a battle was fought in which 20,000 Romans were killed and 10,000 taken prisoners. The darkness of the night favoured the escape of the rest; and Crassus, forced by the mutiny and turbulence of his soldiers, and the treachery of his guides, trusted himself to the general of the enemy on pretence of proposing terms of accommodation. However his head was cut off and sent to Orodes, who poured melted gold down his throat. He has been called avaricious, yet he shewed himself always ready to lend money to his friends without interest. He was fond of philosophy, and his knowledge of history was great and extensive.

CRATEGUS, **WILD-SERVICE TREE**, **HAWTHORN**, &c.: A genus of the digynia order, and icosandria class of plants; natural order, Pomaceæ. Calyx quinquefid; petals five; berry inferior, two-seeded. Twenty species, three of the tree and shrub kind, hardy and deciduous. Those most valuable for economical and ornamental purposes in gardening are the following:

C. OXYCANTHUS, **THE HAWTHORN**, or **WHITE THORN**, grows naturally all over Europe. In the state in which we usually see it, it is nothing better than a tall, uncouth, irregular shrub; but trained up as a standard, it swells to a large timber size, with a tall stem and a full spreading head. The standard hawthorn, whether we view its flowers in the spring, its foliage in the summer, or its fruit in the autumn and winter, is one of the most ornamental plants standing singly, that can be scattered over a park or lawn. This shrub is very useful for making fences. See **HEDGES**. To propagate a quantity of quick, one method is generally practised, viz. first burying the haws, and taking them up to sow the October following; though Hanbury thinks it preferable to prepare the beds, and sow the haws soon after they are gathered. Whoever pursues the former method, having gathered what quantity of haws will answer his purpose, should, in some bye-corner of the kitchen garden or nursery dig a hole or pit capacious enough to receive them; some of the earth which came out of the hole, after the haws are put in it, should be laid upon them; and being thus carefully covered they may remain there till October. Then, having ground well dug, and cleared of the roots of all troublesome weeds, and the mould being fit for working, the beds should be made for the haws. Four feet is a very good width for these beds, as they may be easily reached over to be weeded; and if the alleys between be each one foot and a half wide, they will be of a good size. The beds being marked out with a line, sufficient mould must be raked out to cover the haws an inch and an half deep. This being done, and the bottom of the beds being made level and even, the haws should be sown, and afterwards gently tapped down with the back of the spade; and then the fine mould, which had been raked out of the beds, must be thrown over them, covering them an inch and a half deep. In the spring the plants will come up, and in the summer following should be kept clear of weeds; though it sometimes happens, that few of them will appear till the second spring after sowing. Sometimes the young plants are planted out from the seed-beds at one, two, or three years old; but the best plants are obtained by transplanting them into fresh mould the first or second year, letting them remain in the nursery two or three years longer. Of this species there are the following varieties: the large scarlet, the yellow, the white, the maple-leaved, and the double blossomed hawthorns; and the Glastonbury thorn. The scarlet hawthorn is exceedingly large, oblong,

oblong, perfectly smooth, and of a bright scarlet. The yellow haw is a most exquisite plant. The buds are of a fine yellow, and the fruit is of the colour of gold. The tree retains its fruit all winter. It was originally brought from Virginia, is greatly admired, and no collection of hardy trees should be without it. White hawthorn hardly ever grows to the height of the common hawthorn, and the fruit is small. Maple-leaved hawthorn grows to near 20 feet high, and has very few thorns. The leaves are large, resemble those of the maple, and are of a whitish green. The flowers are produced in large bunches in June, and are succeeded by remarkable fruit, of a shining red, which looks beautiful in winter. Double-blossomed hawthorn produces a full flower, and is one of the sweetest ornaments in the spring. These beautiful double flowers come out in large bunches in May, and the tree often appears covered with them. Glastonbury thorn differs in no respect from the common hawthorn, except that it sometimes flowers in winter. It is said to have been originally the staff of Joseph of Arimathea, who, according to tradition, attended by 11 companions, came over into Britain, and founded the first Christian church in this isle. As a proof of his mission, he is said to have stuck his staff into the ground, which immediately shot forth and bloomed. This tree is pretended to have blossomed on Christmas day ever since; but Hanbury says, in fine seasons they will sometimes be in blow before Christmas, sometimes they afford their blossoms in February, and sometimes it so happens that they will be out so early as Christmas day.

CRATCHES, in the manege, a swelling on the pastern, under the fetlock, and sometimes under the hoof; for which reason it is distinguished into the sinew cratches, which affect the sinew, and those upon the coronet, called quitter-bones.

CRATER, the cup, a constellation in the southern hemisphere, consisting in Mr. Flamsteed's catalogue of 11 stars. See **ASTRONOMY**.

CRATER, in natural history, the mouth of a volcano. See **VOLCANO**.

CRATES, a famous philosopher of Thebes: a disciple of Diogenes the Cynic. It is said that he threw all his money into the sea, that he might the more freely apply himself to the study of philosophy. Others assert that he placed it in another person's hands, with orders to give it to his children if they should happen to be fools: For (said Crates), if they should be philosophers, they will have no need of it; in which case it was to be given to the people. He flourished about B. C. 328.

CRATEVA, the **GARLIC PEAR**, a genus of the monogynia order, and dodecandria class of plants; natural order, Putamineæ. Corolla three-petaled; calyx five-cleft; berry one-celled, many-seeded. There are five species, natives of both the Indies; trees chiefly distinguished by their fruit.

CRATO, a small town of Portugal, in Alentejo, 10 miles W. of Port-alegre.

CRAVAN, or **CRAVANT**, a town of France, in the department of Yonne, nine miles S. E. of Auxerre.

CRAVEN, in geography, a district in Yorkshire, about the source of the river Aire.

CRIVEN, a county in Newbern district, N. Carolina.

CRAX, in ornithology, the **CRASSOU**, a genus of birds, of the order gallinæ. Generic character: Bill strong, convex, and thick, the base of each mandible covered with a cere; nostrils small, fixed in the cere, feathers which cover the head often curling at the ends: tail large and straight. Five species are enumerated.

C. ALECTOR, the **PEACOCK PHEASANT** of Guiana. It abounds in Brazil, and the warm parts of America. It is about the size of a small turkey, and is black, with a white belly. A yellow wax covers about one-half of each mandible; the tongue is entire; the temples are bare and black. These birds are very common at Guiana; and are called powese by the natives from their cry, which is somewhat similar; are pretty numerous in the woods, and make no small part of the food of the planters, who are supplied by the Indian hunters; and their flesh is reckoned as delicate as that of a turkey. They are easily brought up tame. See Plate XXXVIII.

C. RUBRA, the **PERUVIAN-HEN**, is red, with a bluish head. These birds are natives of Mexico and Peru. They feed on fruits, and perch on trees: the flesh is white; and esteemed good food. They are frequently kept tame in our menageries in England, and readily mix with other poultry, feeding on bread and

grain; but they are not able to bear the dampness of our meadows, which makes their toes rot off.

CRAYER, **CASPER DE**, an eminent painter, born at Antwerp in 1535. He was a disciple of Raphael Coxis, whose father had studied under Raphael; but he soon far surpassed his master, and formed for himself a manner that was exceedingly pleasing. The first work which established him in the favour of the court at Brussels, was a portrait of Cardinal Ferdinand, brother to the king of Spain, which he painted at full length, and as large as life. In that picture he succeeded so happily, that the king sent him a gold chain with a medal, and an appointment for a considerable pension. But nothing places the talents of Crayer in a stronger light, than the testimony of Rubens, who went to Antwerp on purpose to visit him, and after examining attentively his picture of the Centurion, in the abbey of Afflegheem, he declared that no painter could surpass Crayer. Nor was he less distinguished by Vandyck. He had not so much fire in his compositions as Rubens, but his design is frequently more correct. His compositions generally consisted of a small number of figures; and he avoided the encumbering of his subject with any thing that did not contribute to its elegance or probability. There is a remarkable variety in his draperies, and an equal degree of simplicity in their folds; and his colouring is admirable. He was accounted to approach nearest to Vandyck, not only in history but in portrait. He principally painted religious subjects, and though he lived to a great age, yet to the last month of his life, he retained the same force and freedom which he possessed in his most vigorous time.

CRAYON, [*crayon*, French,] a general name for all coloured stones, earths, or other minerals and substances, used in designing or painting in pastel: whether they have been beaten and reduced to a paste, or are used in their primitive consistence, after sawing or cutting them into long narrow slips. In this last manner are red crayons made, of blood-stone or red chalk; black ones, of charcoal and black-lead. Crayons of all other colours are compositions of earths reduced to paste.

CRAYON-PAINTING. See **PAINTING**.

CRAZE-MILL, or **CRAZING-MILL**, a mill in all respects like a grist-mill to grind corn, and so called by the tin-miners, who use it to grind their tin, which remains too great after trampling.

CREAM, [*cremor*, Latin,] a general name applicable to all substances that separate from a liquor, and are collected upon its surface.

CREAM, **CORSTORPHINE**, a very agreeable preparation of milk, slightly acidulated, for which the village of Corstorphine has been famous for centuries past. The Rev. Mr. Oliver says "the most approved process" for making it "is very simple, and is as follows: They put the milk, when fresh drawn, into a barrel, which is submitted to a certain degree of heat, generally by immersion in warm water. This accelerates the stage of fermentation; the serous is separated from the other parts of the milk, the oleaginous and coagulable; the serum is drawn off by a hose in the lower part of the vessel; what remains is put into the plunge churn, and after being agitated for some time is sent to market."

CREAM OF MILK, the most oily part, which being naturally only mixed, and not dissolved in the rest, soon separates, being specifically lighter; after which it collects on the surface; from which it is generally skimmed, to complete the disengagement of the oily from the caseous and serous parts. Cream is an agreeable and very nourishing article of food, when fresh; but too fat and difficult to be digested by persons of a sedentary life, or possessed of a weak stomach. It is nevertheless of considerable service in medicine, as a lenient (though palliative) application to tetter and erysipelas, which are attended with pain, and proceed from acrid humours.

CREAM, A METHOD OF PRESERVING. Take 12 ounces of white sugar, and dissolve them in the smallest possible quantity of water, over a moderate fire. After the solution has taken place, the sugar ought to be boiled for about two minutes in an earthen vessel; when 12 ounces of new cream should be immediately added, and the whole uniformly mixed, while hot. Let it then gradually cool, and pour it into a bottle, which must be carefully corked. If kept in a cool place, and not exposed to the air, it may be preserved in a sweet state for several weeks, and even months.

CREAM OF TARTAR, is the crystals of tartar pulverised. It is a supertartrate of potash well known as a mild purgative, and of late years has been employed largely with advantage in dropsies.

CREATION,

CREATION, [*creatio*, from *creo*, Lat.] in its primary import, signifies the bringing into being something which did not before exist. The term is therefore most generally applied to the original productions of the materials whereof the visible world is composed. It is also used in a secondary or subordinate sense, to denote those subsequent operations of the Deity upon the matter so produced, by which the whole system of nature, and all the primitive genera of things, received their form, qualities, and laws. There are few subjects, concerning which there have been more disputes than this. It is certain that many of the ancient philosophers had no idea of its being possible to produce a substance out of nothing, or that even the power of the Deity himself could work without any materials to work upon. Hence some of them, particularly Aristotle, asserted that the world was eternal, both as to its matter and form. Others, though they believed that the gods had given the world its form, yet imagined the materials whereof it is composed to have been eternal. Indeed the opinions of the ancients, who had not had the benefit of revelation, were on this head so confused and contradictory, that nothing of any consequence can be deduced from them. The freethinkers of the present and former ages have denied the possibility of creation, as being a contradiction to reason; and of consequence have taken the opportunity from thence to discredit revelation. On the other hand, many defenders of the sacred writings have asserted, that creation out of nothing, so far from being a contradiction to reason, is not only probable, but demonstrably certain. Nay, some have argued, that from the very inspection of the visible system of nature, we are able to infer, that it was once in a state of non-existence. It would be impossible for us, however, to enter into the multiplicity of arguments used on both sides; nor can we pretend to settle it on the ground of human reason, since the subject is confessedly above human comprehension. But one thing appears to be certain, that, as we have no ideas but what we receive from our senses, and as no man ever saw any thing created out of nothing, so the idea of such a creation never could have entered into the mind of man, if it had not been at first revealed to the first pair, by the Creator himself, and afterwards communicated by tradition to their posterity. Hence the Christian may draw a decisive argument in favour of the divine origin of that system of religion, which first promulgated this doctrine. No person who believes in the existence of one infinite, omnipotent, and omniscient, Deity, can doubt, that, all other beings whatsoever are his creatures. Men and other animals that inhabit the earth, the air, and the waters; all the immense varieties of herbs and plants of which the vegetable kingdom consists; the globe of the earth, and the expanse of the heavens; these we know to have been produced by his power. Besides the terrestrial world which we inhabit, we see many other material bodies disposed around it in the wide extent of space. The moon, which is in a particular manner connected with our earth, and even dependent upon it; the sun, and the other planets with their satellites, which, like the earth, circulate round the sun, and appear to derive from him light and heat; those bodies which we call fixed stars, and consider as illuminating and cherishing with heat each its peculiar system of planets; and the comets which at certain periods surprise us with their appearance, and whose connection with the general system of nature, or with any particular system of planets, we know very little about. See ASTRONOMY. These are so many more of the Deity's works, from the contemplation of which we cannot but conceive the most awful ideas of his infinite creative power. Matter, however, whatever the varieties of form under which it is made to appear, the relative disposition of its parts, or the motions communicated to it, is but an inferior part of the works of creation. We ourselves are animated with a much higher principle than brute matter; in viewing the manners and economy of the lower animals, we can scarce avoid acknowledging even them to consist of something more than mere modifications of matter and motion. The other planetary bodies which seem to be in circumstances nearly analogous to those of our earth, are doubtless, as well as it, destined for the habitations of rational, intelligent beings. The existence of created intelligences of a higher order than man, appears extremely probable.—Of those spiritual beings called Angels we have express intimation in scripture, (See ANGELS.) Such are our notions concerning the existence of beings essentially distinct from matter, and in their nature far superior to it: these are the creatures of the Deity. But the limits of creation we cannot pretend

to define. How far the regions of space are filled, we know not. How the planetary worlds, the sun and the fixed stars, are occupied, we cannot ascertain. We are even ignorant how wide a diversity of forms, what an immense number of animated beings, inhabit our own globe. So confined is our knowledge of creation; yet so grand, so awful, that part which our limited understandings can comprehend! At what periods of time the Deity executed his several works of creation mankind have no particular information. From viewing the phenomena of nature, and considering the general laws by which they are regulated, we cannot draw any conclusive, or even plausible inference, with respect to the precise time at which the universe began to exist. We know not, whether the different systems of planets circulating round our sun and the other fixed stars, were all created at once, or at different periods. We cannot even determine, from any thing that appears on the face of nature, whether our earth was not created at a later period than any of her fellow planets which revolve round the same sun. Astronomers are, from time to time, making new discoveries in the heavens; and it is impossible to say whether some of these successive discoveries may not be owing to successive creations. Philosophers have, indeed, formed some curious conjectures concerning the antiquity of the earth, from the appearances of its surface, and from the nature and disposition of its interior strata. The beds of lava in the neighbourhood of volcanoes have afforded ground for some calculations, which, though they do not fix the period of the earth's origin, are yet thought to prove that period to have been much more remote than the earliest age of sacred or profane history. In the neighbourhood of mount *Ætna*, or on the sides of that extensive mountain, there are beds of lava covered over with a considerable thickness of earth; and another, which, though known from ancient monuments and historical records to have issued from the volcano at least 2000 years ago, is still almost entirely destitute of soil and vegetation: In one place a pit has been cut through seven different strata of lava; and these have been found separated from each other by almost as many thick beds of rich earth. Now, from the fact, that a stratum of lava 2000 years old is yet scantily covered with earth, it has been inferred by the ingenious canon *Rebupero*, who has laboured thirty years on the natural history of mount *Ætna*, that the lowest of these strata, which have been found divided by so many beds of earth, must have been emitted from the volcanic crater at least 14,000 years ago; and consequently that the age of the earth, whatever it may exceed this term of years, cannot possibly be less. Other facts of a similar nature concur to favour this conjecture. But all these facts are as nothing in comparison with the long series which would be requisite to establish such a conjecture as an incontrovertible truth. And, besides, any evidence, which they can be supposed to afford, may be very easily explained. The bed of lava, which in the course of 2000 years has scarcely acquired a covering of earth, is confessed to stand in a situation in which it is exposed to the spray of the sea, and to all the violence of the winds and rains. In such a situation, it cannot be thought that a thick bed of earth could, in any length of time, be formed on it: we might as well expect depth of soil and vigorous vegetation on the craggy cliffs of hills. In crevices here and there over it, in which the earth has been retained, there is a depth of soil which supports large trees. The fact, therefore, admits of no such inference as that which *Recupero* has deduced from it. The local circumstances, again, of the seven strata that have been pierced through, are very different. They are situated at *Jaci Reale*, in a situation where showers of ashes from the volcano must frequently fall; and where whatever falls must be naturally retained and accumulated: so that seven beds of earth might be formed on these seven strata of lava, much sooner than one thin layer could be formed on the stratum above mentioned. In other places, some of which are within the influence of the same awful volcano, and some adjacent to that of *Vesuvius*, soil is known to have accumulated on lava, with the help of showers of ashes from the volcanoes, with sufficient rapidity to justify this supposition concerning the coverings of the strata at *Jaci Reale*. From the observation of these phenomena of volcanoes, therefore, no facts have been gained, that can help us to determine with any certainty the earth's age. And so wide is the variety of circumstances to be here taken into the account, that it cannot be hoped that this desideratum will be ever supplied from this quarter. But, by examining the composition and arrangement of the interior strata of the globe, and by viewing the general appearance

appearance of its surface, philosophers have endeavoured to guess at the length of time during which it must have existed. Observing the exuviae of sea and land animals deposited at profound depths under ground, and accompanied with vegetable bodies in a good state of preservation, as well as with oleaginous and bituminous substances which have in all probability been formed from vegetable bodies; and remarking at the same time with what confusion the other materials, composing the crust of this terrestrial ball, are, in various instances, not arranged, but cast together; they have concluded that the earth must have existed for many an age before the earliest events recorded in sacred or profane history, and must have undergone many a revolution before it settled in its present state. Such at least are the ideas which the Count de Buffon, M. de Luc, and Dr. Hutton, have communicated concerning its changes and antiquity. It is but justice to these philosophers to acknowledge, that they have collected, with amazing industry, almost every fact in the natural history of the earth that can serve to give plausibility to their conjectures. But still their facts, besides the inconsistency of many of them, are by far too scanty to warrant the conclusions which they have deduced from them. See EARTH. Profane history is far from being decisive concerning the age of the world; nor is it to be expected that it should. When the earth first arose into existence, mankind were not spectators of the event: and we may naturally imagine that the first human beings who occupied it, would be too much busied in furnishing themselves with the immediate necessities and the conveniences of life, to think of curious researches into its origin, or even their own. Profane history is not, however, without accounts of the age of the earth, and the origin of human society; but these accounts are various and contradictory. Plato, in his *Critias*, mentions his Atlantis to have been buried in the ocean about 9000 years before the age in which he wrote. He asserts it to have been well known to the Egyptian priests, and to the contemporary inhabitants of Attica. But the learned world generally agree in regarding his accounts of that island as a fiction, which the author himself did not design to be understood in any other light. The Chinese represent the world as some hundreds of thousands of years older: and we are also told that the astronomical records of the ancient Chaldeans carried back the origin of society to a very remote period; no less than 473,000 years. The Egyptian priests reckoned between Menes and Sethon 341 generations. But these accounts are so discordant, and so slenderly supported by evidence, that we cannot hesitate to reject them as false; the fables of historians scarce merit so much attention as the hypotheses of philosophers. From sacred history, we may reasonably expect more accurate information concerning the antiquity of the globe. As the authenticity of the Holy Scriptures is incontrovertibly established, wherever they afford evidence concerning any fact, that evidence must be regarded as decisive. A fact so important as the present may be thought highly worthy of a place in them; but it should be remembered, that they have a much higher object in view than the adjusting of chronology; viz. the eternal felicity of mankind. It is evidently but a secondary object of the Scriptures to hint at the era of creation. We need not, therefore, be surprised that they do not fix it with accuracy; or that they leave us at a loss whether to extend what they say concerning that era to the whole contents of created space, or to confine it to our earth and its inhabitants; much less need we be surprised, that among the numerous copies made out of them, different dates should be found in different versions. The Hebrew copy of the bible, which Christians consider as the most authentic, dates the creation 3944 years before the Christian era. The Samaritan bible, again, fixes the era of the creation 4305 years before the birth of Christ. And the Greek translation, known by the name of the Septuagint version of the bible, gives 5270 as the number of the years, which intervened between those two periods. By comparing the various dates in the sacred writings, examining how these have come to disagree and to be diversified in different copies, endeavouring to reconcile the most authentic profane with sacred chronology, some ingenious men have formed very plausible schemes of chronology. Ussher makes out from the Hebrew bible 4004 years, as the term between the creation and the vulgar era of the birth of Christ: Josephus, according to Dr. Wills and Mr. Whiston, makes it 4658 years; but the Rev. William Hales, D.D. in his "Rectification of the Chronology of Josephus," with great ingenuity and learning, demonstrates it to be 5411 years. M.

Pezron, with the help of the Septuagint, extends it to 5872 years. Ussher's system is the most generally received; and, in our opinion, is the best that has hitherto been given. But though these different systems of chronology disagree, yet the differences among them are so inconsiderable, when compared with those which we find in the chronologies of the Chinese, the Chaldeans, and the Egyptians, and they agree so well with the general information of authentic history, and with the appearances of nature and of society, that they may be considered as nearly fixing the true period of the creation of the earth. See CHRONOLOGY. Some difficulties occur in comparing the above account of the creation, with the laws which appear at present to regulate the system of nature. It seems hard to conceive how the earth, while yet a stranger to the influence of the sun, could experience the vicissitude of day and night. The condition of matter when the earth was without form and void, and the operation of the Spirit of God on the face of the waters, are equally mysterious. Some ingenious men have eagerly laboured to remove these difficulties. Among these is Dr. Burnet, who supposes all the celestial bodies, even the sun and all the other planets of the solar system, to have existed long before the earth. The chaos on which the Spirit of God moved, consisted, according to him, of the first principles from which all terrestrial bodies have been formed. When those laws, by which the material world is regulated, first began to operate on the mass, he supposes that its grosser and heavier parts would sink towards the centre, and there form a solid ball. Around this solid ball, two species of particles would still float together in confusion. Of these, he thinks one, being more volatile, would by degrees make its escape from the other, would leave it still recumbent on the solid centre, and spread around it in an atmosphere. The middle stratum he composes of aqueous and oleaginous fluids; and he makes no doubt, that after the air had made its escape, the levity of the oleaginous fluids would enable them to rise above the aqueous, and dispose themselves next the surface of the liquid mass. On them he supposes the impure atmosphere to have then deposited a quantity of terrene particles, sufficient to form, by intermixture with the oils, a thick crust of rich earth for the production of plants and herbage, and to afford an habitation to animals. This delicate shell he was careful not to furrow with seas, or load with mountains; either of these would have reduced all to confusion. Such is his earth; and after moulding it with so much ingenuity, and into so happy a form, he contents himself, without venturing to use the same freedoms with the remaining part of Moses's account of the creation. We need not attempt to refute so absurd a theory which has long been justly condemned as equally unsupported by scripture and philosophy. Mr. Whiston treats both the scriptures and the laws of nature with greater reverence; yet he certainly involves himself in no small difficulties in attempting to solve those of Moses. He supposes the sun, moon, and stars, to be all more ancient than the earth. The chaos from which the earth was formed, he represents as having been originally the atmosphere of a comet. The six days of the creation he would persuade us to be equal to six of our years: for he is of opinion that the earth did not revolve daily round its axis, but only annually round its orbit, till after the fall. On the first day or year, therefore, the more ponderous parts of the chaos were according to this theory conglomerated into an orb of earth, the chinks and interstices over that orb filled up with water, and the exterior part or atmosphere rarefied, so as to admit some faint glimmering of the rays of the sun. On the second day, the atmosphere was diffused to its due extent around the earth, and reduced to a degree of rarity and purity which rendered it still more suitable for the transmission of light; the earth was still more consolidated; and the waters, being almost entirely excluded from the interstices which they before occupied, were partly spread over the surface of the earth, and partly raised in vapour into the atmosphere or firmament. On the third day the earth's surface became so irregular, in one place rising into hills, in another sinking into vales, as to cause the waters, which were before equally diffused, to collect into seas and lakes, leaving large tracts of ground unoccupied. And no sooner was a part of the earth's surface left bare by the waters, than the general influence of the sun produced on it a rich covering of herbage, and all the different species of vegetables. On the fourth day, the earth was rendered subject to the regular influence of the sun, moon, and stars. On the fifth day, or year, things were so far advanced, that fishes and fowls were now produced from the waters. On the

sixth day the earth was furnished with animals; and the lord of all the other animals, man, was now created. Such is Mr. Whiston's account of the phenomena of the Mosaic creation. But he likewise assumes much more than can be reasonably granted. The atmosphere of a comet could not well be the primitive chaos; it is not an obscure, but a pellucid fluid; and its exterior strata, if of the same nature with the matter of our earth, must be scorified by its near approach to the sun. Had the earth not begun to move round its axis till after the work of creation was completed, the immoderate degrees of heat and cold which its different parts would have alternately felt, would in all probability have proved fatal to both plants and animals. No interpretation of Moses's words can represent him as informing us, that the sun and moon were created at different periods. Nor will philosophy permit us to imagine, that the moon was formed before the earth. And therefore we cannot agree with Mr. Whiston, that the creation of the earth was later than that of the other bodies of the solar system. M. de Luc, like Mr. Whiston, thinks that the days of the creation were much longer periods of time than our present days. He seems to think that the earth had existed long before the Mosaic creation; but began at that era to experience new changes, and to be regulated by new laws: that all the different events described by Moses in his history of the creation, actually took place in the order in which he relates them; but that Moses's days are indefinite spaces of time, which must have been very long, but of which we cannot hope to ascertain the precise length. These are ingenious conjectures; but they do not appear necessary, nor are they justified by history. What appears to us the most natural way of understanding Moses's account of the creation, is, that it was neither confined to the earth alone, nor extended to the whole universe. The relation which all the planets of the solar system bear to the same illuminating body countenances the conjecture, that they, together with the luminary by which they are enlightened, were all created at one period. On the supposition, that the whole solar system, at least, was created at once, which certainly does no violence to the narrative of Moses, the creation of the sun and the other planets may be understood to have been carried on at the same time with the creation of the earth. In that case, even in the course of the first day, though not longer than our present days, those bodies might be reduced to such order, and their relative motions so far established, as to begin the distinction between light and darkness, day and night. On the second day, we may naturally understand from Moses's narrative, that the atmosphere was purified, and the specific gravities of aqueous vapour and atmospheric air so adjusted, as to render the latter capable of supporting the former. On the third day the waters were first collected into lakes and seas; but in what manner, we cannot determine. Some call in the operation of earthquakes; others that of specific gravity, &c. But these are mere fancies; and we have not facts to offer in their stead. On the latter part of this day vegetables were caused to spring up over the earth. Their growth must have been much more rapid than we ever behold it now: but by what supernatural power that might be effected, we should in vain inquire. On the fourth day the sun, moon, and stars, were made to appear. But according to the conjecture which we have mentioned as plausible, those heavenly bodies may have been created before this day; though they had not till now begun to exert their full influence on the earth, as they have since continued to do. The creation of the inanimate world was now finished, and the earth prepared for the reception of animals. On the fifth day, therefore, were the living inhabitants of the air and the waters created. On the sixth day the inferior animals inhabiting the earth were first created; and after that, the whole work was crowned by the creation of a male and a female of the human species. To the account of the creation of the animals, nothing certain can be added in explanation of Moses's narrative. As only one pair of the human species were at first created, the same economy might possibly have been observed in the creation of the inferior animals. Though many philosophers, leaning too much on their own too often delusive reasonings, have endeavoured to bring into dispute the Mosaic account of the creation; yet, after all their bitter sarcasms and ingenious sophisms, none of them have yet been able to propose to the world any other system instead of it, which is at all plausible, or which would do any credit to the infinite intelligence, and eternal omniscience, of the Divine Being.

CREDENTIALS are particularly applied to letters of recom-

mendation and power, given to ambassadors or public ministers, by the prince or state that sends them to foreign courts.

CREDIBILITY, a species of evidence, less than absolute certainty or demonstration, but greater than mere possibility: it is nearly allied to probability, and seems to be a mean between possibility and demonstration.

CREDIT, in commerce, a mutual trust, or loan of merchandise, or money, on the reputation of the property or solvency of a dealer. Credit is either public or private. Every trader ought to possess some estate, stock, or portion, of his own property, sufficient to carry on the traffic in which he is engaged: his dealings should also never exceed his capital, so that no disappointment in his return may incapacitate him from supporting his credit. Yet traders of worth and judgement, may sometimes be obliged to borrow money, in order to carry on their business to the best advantage. We cannot, however, avoid observing, that the almost unlimited credit given to wholesale, as well as retail traders, is by no means a prudential, or even justifiable practice; for it not only tends to encourage the most shameful monopoly carried on, at present, with many articles, both of subsistence and convenience (for instance, those of bread-corn and paper); but here also we may discover the prolific source of those bankruptcies which swell every Tuesday's and Saturday's Gazette. The public national credit is said to run high, when the commodities of that nation are readily sold at a good price, and when dealers may be safely entrusted with them: also, when houses and lands meet with ready purchasers; money is borrowed at a low interest; and, lastly, when notes, mortgages, &c. will pass as currently as money. Private credit has no accurate scale, and depends entirely on the mutual confidence of the parties. When it is extended beyond a certain length, without proper controul (as is too frequently the case with families of a certain rank, or fashion,) we may safely predict, that the following generally are its concomitant effects, viz. inferior goods, higher charges, inaccurate calculations, and law-suits, which dissolve all future connection. The advantage of giving credit to men of large capitals is that they get higher prices, the difference between the money-price and the credit-price being greater than the legal interest of the money-price for the time. Hence it is a principle with some traders to give very long credit at proportionate prices. The advantage to purchasers of small capital is, that these credits are so much addition to their capital for the time. Some men of large property, but whose concerns admit of indefinite extension, will take all the credit they can get, either on pecuniary loans, or in purchases, being able to make a larger profit on any capital they can procure by either of these methods, than it costs them. They are exposed, however, 1. to the risk of having great demands made upon them when it may be inconvenient to satisfy them; and, 2. to the very common misfortune of forgetting how much of their capital belongs to other people: Dr. Franklin's observation being too true, that most men think their debt and their sins less than they really are. A person on whom credit is placed, and to whom it is advantageous, should be religiously punctual. Nothing will so much confirm his credit. He, however, is in a safer condition who can give credit without taking any; who sells on credit, but buys for money. And this should in general be the object of every young tradesman.

CREDIT is also used for the currency which papers or bills have in the public or among dealers. In this sense credit is said to rise, when, in negotiating the shares of the company, they are received and sold at prices above par, or the standard of their first creation. Discredit is opposed to credit, and is used where money, bills, &c. fall below par.

CREDIT was also anciently a right which lords had over their vassals; consisting in this, that during a certain time they might oblige them to lend them money. In this sense, the Duke of Brittany had credit during 15 days on his own subjects, and those of the Bishop of Nantes; and the bishop had the same credit or right among his subjects and those of that prince.

CREDIT, LETTERS OF, are those given to persons in whom a merchant, &c. can trust, to take money of his correspondent abroad, in case he happens to need it.

CREDITON, a town in Devonshire, which has a considerable woollen manufactory. It is situated 12 miles N. W. of Exeter.

CREECH, THOMAS, eminent for his translations of ancient authors both in prose and verse, was son of Thomas Creech, and born near Sherbourne in Dorsetshire, in 1659. He was educated under

under Mr. Carganven of Sherborne, and entered a commoner of Wadham college in Oxford, in 1675. He was accounted a good philosopher and poet, and a diligent student. In 1699, having taken holy orders, he was presented by his college to the living of Welwyn, in Herefordshire; but this he had not long enjoyed before he put an end to his own life. The author of the *Nouvelles de la Republique des Lettres* informs us, that in 1700, Mr. Creech fell in love with a woman, who treated him with great neglect, though she was complaisant enough to several others. This affront he could not bear, and resolved not to survive it. Wherefore he shut himself up in his study, where he hanged himself, about the end of June, 1700, and was found in that situation three days after. The Poetical Register ascribes this fatal catastrophe to the moroseness of his temper, which made him less esteemed than his great merit deserved, and engaged him in frequent animosities and disputes. But from an original letter of Arthur Charlett, preserved in the Bodleian library, it has been discovered, that this unhappy event was owing to a very different cause. There was a fellow collegian of whom Creech frequently borrowed money; but, repeating his applications too often, he met one day with such a cold reception, that he retired in a fit of gloomy disgust, and in three days was found hanging in his study. Creech's principal performances are, 1. A Translation of Lucretius. 2. A Translation of Horace; in which, however, he has omitted some odes. 3. The *Idylliums* of Theocritus, with Rapin's Discourse of Pastorals. 4. A Translation of Manilius's *Astronomicum*. Besides translations of several parts of Virgil, Ovid, and Plutarch; printed in different collections.

CREED, APOSTLES, a formula, or summary, of the Christian faith, drawn up, according to Rufinus, by the apostles themselves; who, during their stay at Jerusalem, soon after our Lord's ascension, agreed upon this creed, as a rule of faith. Baronius and others conjecture, that they did not compose it till the second year of Claudius, a little before their dispersion. As to their manner of composing it, some say, that each Apostle pronounced his article, which is the reason of its being called *symbolum Apostolicum*, it being made up of sentences jointly contributed, after the manner of persons paying each their club, (*symbolum*,) or share of a reckoning. But there are many reasons which induce us to question whether the apostles composed any such creed. For, 1st. Neither St. Luke, nor any other writer before the 5th century, make any mention of an assembly of the apostles for composing a creed. 2dly, The fathers of the three first centuries, in disputing against the heretics, endeavour to prove, that the doctrine contained in this creed was the same which the apostles taught; but they never pretend that the apostles composed it. 3dly, If the apostles had made this creed, it would have been the same in all churches, and in all ages; and all authors would have cited it after the same manner. But the case is quite otherwise. In the second and third ages of the church, there were as many creeds as authors, and the same author sets down the creed after a different manner in several places of his works; which is an evidence that there was not at that time any creed reputed to be the apostles. In the 4th century, Rufinus compares together the three ancient creeds of the churches of Aquileia, Rome, and the East, which differ very considerably. Besides, these creeds differed not only in the terms and expressions, but even in the articles, some of which were omitted in one or other of them; such as those of the descent into hell, the communion of the saints, and the life everlasting. From all which it may be gathered, that though this creed may be said to be that of the apostles, in regard to the doctrines contained therein, yet it cannot be referred to them as the authors of it. Its great antiquity, however, may be inferred from hence, that the whole form, as it now stands in the English liturgy, is to be found in the works of St. Ambrose and Rufinus; the former of whom flourished in the 3d, and the latter in the 4th century. The primitive Christians, did not publicly recite the creed, except at baptisms, which, unless in cases of necessity, were only at Easter and Whitsuntide. The constant repeating of it was not introduced into the church till the end of the 5th century; about which time Peter Gnapheus, bishop of Antioch, prescribed the recital of it every time divine service was performed.

CREED, ATHANASIAN, OF CREED; NICENE. See **ATHANASIAN** and **NICENE**. These two, with the Apostles Creed, are the most universal. They are used in the public offices of the church

of England; and subscription to them is required of the clergy, and of dissenting teachers properly qualified by the toleration act, as the 8th article declares that they may be proved by the surest testimonies of scripture.

CREE INDIANS, a nation of North Americans who inhabit W. of Winnipeg, around Fort Dauphin, in Upper Canada.

CREEK, a part of a haven, where any thing is landed from the sea. So many landing places as there are in a harbour or port, so many creeks there are. It is also said to be a shore or bank whereon the water beats, running in a small channel from any part of the sea; from the Latin *crepido*. This word is used in the stat. 4 Hen. IV. c. 20, and 5 Eliz. c. 5.

CREEK seems to be used, in the United States of America, in a sense different from those in the above definitions; being repeatedly applied by Messrs. Morse and Scott, in their *Gazetteers*, to small rivers, several of which it makes part of the names of.

CREEKS, confederated nations of North American Indians. They form a numerous tribe in Georgia.

CREEPER, in naval affairs, an instrument of iron resembling a grappling iron, having a shank, and four hooks or claws. It is used to throw into the bottom of any river or harbour, with a rope fastened to it, to hook and draw up any thing from the bottom which may have been lost. See Plate XXVII.

CREEPER, in ornithology. See **CERTHIA**.

CREEPING LEAF, in zoology. See **MANTIS**.

CREE-TOWN, a small sea-port of Scotland, in Kirkcudbrightshire.

CREGLINGEN, a town of Germany, in the circle of Franconia, and principality of Anspach, and 22 miles S. of Wurtzburgh.

CREICHGOW, a country of Germany, between Suabia and the Lower Palatinate.

CREIL, a town of France in the department of Oise, 5 miles N. W. of Senlis.

CREMA, a town of Italy, capital of Cremasco, now included in the department of Adda. It is situated 20 miles N. of Piacentia.

CREMASCO, a small territory of Italy, in the late Venetian territories, now included in the department of Adda. It is fertile in corn, wine, and flax.

CREMASTER, in anatomy, the name of two muscles of the testicles, of which there is one on each side.

CREMATION is particularly applied to the ancient custom of burning the dead. This custom is well known to have prevailed among most eastern nations, and continued with their descendants after they had peopled the different parts of Europe. It prevailed in Greece, Italy, Gaul, Britain, Germany, Sweden, Norway, and Denmark, till Christianity abolished it.

CREMIEU, or **CREMIU**, a town of France, in the department of Isere, 18 miles E. of Lyons.

CREMMEN, a town of Germany, in Upper Saxony.

CREMONA, an ancient city of Italy, capital of the Cremonese, 30 miles N. W. of Parma. Lon. 9. 58. E. Lat. 45. 8. N.

CREMONESE, a territory of Italy, in the late duchy of Milan, north of Parma.

CREMOR, in anatomy, is used for Chyle.

CRENOPHYLAX, [*ἡ κρηνη*, fountain, and *ἡ φύλαξ*, the guardian,] in antiquity, a magistrate of Athens, who had the inspection of fountains.

CREODIBA, [from *creuy* and *diven*, i. e. wood-robbers,] in the customs of the middle age, a robbery and murder committed in a wood, where the body of the person killed was burnt, in order to prevent any discovery of the crime.

CREOLES, a name given to the families descended from the Spaniards who settled at Mexico, in America. These are much more numerous than either the Spaniards properly so called, or the Mulattoes: which two other species of inhabitants are excluded from all considerable employments. The name throughout the rest of the West Indies is applied to all the natives who are descended from European parents.

CREON, king of Corinth, in fabulous history, the son of Siphos. He promised his daughter Glauce to Jason, who had repudiated Medea. To revenge the success of her rival, Medea sent her as a present, a gown covered with poison. Glauce put it on, and was seized with sudden pains. Her body took fire;

the house also was consumed, along with Creon and his whole family.

CREON, king of Thebes, in fabulous history, the son of Menætiæ, and father of Jocasta, the mother and wife of Oedipus. On the death of Laius, who had married Jocasta, Creon ascended the vacant throne of Thebes. As the ravages of the Sphynx were intolerable, Creon offered his crown and daughter in marriage to him who could explain the enigmas which the monster proposed. Oedipus explained the riddles, ascended the throne, and married Jocasta, without knowing she was his mother; and by her he had two sons, Polynices and Eteocles, and two daughters.

CREPIDÆ, in Roman antiquity, a kind of slippers or shoes, which were always worn with the pallium, as the calcei were with the toga.

CREPIS, **HAWK-WEED**: a genus of the polygamia superflua order, and syngenesia class of plants; natural order, Compositæ. Receptacle naked; calyx calyculated with deciduous scales; pappus feathery and stalked. There are twenty-three species, most of them herbaceous annuals.

CREPITATION, in chemistry, the noise which some salts make over the fire in calcination.

CREPITATION, in surgery, the noise made by the ends or pieces of bones, when the surgeon moves a limb to assure himself by his ear of the existence of a fracture.

CREPUNDIA, in antiquity, a term used to express such things as were exposed along with children, as rings, jewels, &c. serving as tokens whereby they afterwards might be known.

CREPUSCULUM, [from *creperus*, Lat. doubtful, *q. d.* a dubious light,] the twilight. See **ASTRONOMY** and **TWILIGHT**.

CRESCENT, [*crescens*, Lat.] the new moon, as it begins to recede from the sun, shews a little rim of light, terminating in points or horns, which are still increasing till it become full and round in the opposition. The term is also used, but improperly, for the same figure of the moon in its decrease. The horns are then turned towards the W. whereas they point to the E. in the proper crescent.

CRESCENT, in heraldry, is a bearing in form of a half moon. The Ottomans bear sinople, a crescent montant, argent. The crescent is frequently used as a difference in coat-armour, to distinguish it for that of second brother or junior family. The figure of the crescent is the Turkish symbol; or rather is that of the city Byzantium, which bore this device from all antiquity; as appears from medals struck in honour of Augustus, Trajan, &c. See **HERALDRY**.

CRESCENT is also the name of a military order, instituted by Renatus of Anjou, king of Sicily, &c. in 1448; so called from its symbol, a crescent of gold enamelled. Renatus took for his device a crescent, with the motto loz, "praise," which in the style of rebus, makes loz in crescent, *q. d.* by advancing in virtue, one merits praise.

CRESCENTIA, the **CALABASH TREE**, a genus of the angiospermia order, and didynamia class of plants; natural order, Putamineæ. Calyx bipartite, equal; corolla gibbous; berry pedicelated or stalked, unilocular, and polyspermous; seeds bilocular. There are two species:

C. CUJETE, with oblong narrow leaves, and a large oval fruit.

C. LATIFOLIA, the broad-leaved calabash, seldom rises more than 15 or 20 feet high, with an upright trunk. They are both natives of the West Indies.

CRESCENTINO, a fortified town of Italy, in Piedmont, seated on the Po.

CRESPEY, or **CRESPIY**, a town of France, in the department of Oise, 39 miles N. E. of Paris.

CRESS, a species of *Lepidium*.

CRESS, **WATER**. See **SISYMBRIUM**.

CRESSA, in botany, a genus of the pentandria digynia class and order. Calyx five-leaved; corolla salver form; filaments sitting on the tube; capsule two-valved, one-seeded. There are two species, natives of the East Indies, in salt marshes.

CRESSY, or **CRECY**, a town of France, in the department of Somme, in the late province of Picardy; remarkable for a great victory obtained over the French by Edward III. of England, in 1346. Edward having encountered and overcome many difficulties in his expedition, was at last so closely followed and harassed by the French army, commanded by Philip VI. King of France

in person, that he determined to make a stand at this place, and to give his pursuers a check. For this purpose he chose his ground with great judgement, on the gentle declivity of a hill, with a thick wood in his rear. He ordered deep entrenchments to be made on each flank, and waited with firmness the approach of his enemies. The King of France, dreading nothing so much as the escape of the English, began the march of his great army from Abbeville early in the morning, August 26, and continued it several hours with great eagerness, till he received intelligence that the English had halted at Cressy, and were prepared to give him battle. He was advised at the same time not to engage that day, when his troops were much fatigued with their march, and in great disorder; and he was disposed to have taken this advice. But the discipline of these times were so imperfect, that the orders given for halting were not obeyed; and one corps of this mighty host impelling another, they continued advancing till they came into the presence of their enemies in much confusion. Edward had employed the forenoon of this important day in drawing up his army in the most excellent order, in three lines. The first line, which consisted of 800 men at arms, 4000 English archers, and 600 Welsh foot, was commanded by his young, amiable, and heroic son, the Prince of Wales, assisted by the Earls of Warwick and Oxford, and several other noblemen. The second line, composed of 800 men at arms, 4000 halberdiers, and 2400 archers, was led by the Earls of Arundel and Northampton; the last line, or body of reserve, in which were 700 men at arms, 5300 billmen, and 6000 archers, was ranged along the summit of the hill, and conducted by the King in person, attended by the Lords Mounbray, Mortimer, and others. When the army was completely formed, Edward rode along the lines, and by his words and looks inspired his troops with the most ardent courage and strongest hopes of victory. He then commanded the cavalry to dismount, and the whole army to sit down upon the grass, in their ranks, and refresh themselves with meat, drink, and rest. As soon as the French army came in view, they sprang from the ground, full of strength and spirit, and stood ready to receive them. The King of France, asisted by the Kings of Bohemia and Majorca, the Dukes of Lorraine and Savoy, and several other sovereign princes, with the flower of the French nobility, laboured to restore some degree of order to his prodigious army, and drew it up also in three lines, but very indistinctly formed. The first line was commanded in chief by the King of Bohemia; the 2d by the Earl of Alencon, the French king's brother; and the 3d by Philip in person: and each of these lines contained a greater number of troops than the whole English army. The battle was begun about three o'clock P. M. Aug. 26, by a great body of Genoese cross-bowmen, in the French service, who let fly their quarrels at too great a distance to do any execution, and were presently routed by a shower of arrows from the English archers. The Earl of Alencon, after trampling to death many of the flying Genoese, advanced to the charge, and made a furious attack on that corps commanded by the Prince of Wales. The Earls of Arundel and Northampton advanced with the 2d line to sustain the Prince, and Alencon was supported by as many troops as could crowd to his assistance. Here the battle raged for some time with uncommon fury; and the King of Bohemia, the Earl of Alencon, and many other great men, being slain, the whole 1st and 2d lines of the French army were put to flight. Philip, undismayed, advanced to the charge with the line under his immediate command. But this body soon shared the same fate with the other two; and Philip, after having being unhorsed, and wounded in the neck and thigh, was carried off the field by John de Hainault, and fled with no more than five knights and about 60 soldiers in his company, of all his mighty army, which at the beginning of the battle consisted of more than 120,000 men. Such was the famous victory of Cressy, the greatest ever gained by any king of England. Edward continued with his army at Cressy three days, numbering and burying the dead. The French had left on this bloody scene the King of Bohemia, 11 other princes, 80 bannerets, 1200 knights, 1500 gentlemen, 4000 men of arms, and 30,000 other soldiers. (Henry's History of Britain, vol. iv. p. 178.) Cressy lies 10 miles N. of Abbeville, 32 S. E. of Calais, and 100 N. of Paris.

CREST, in armoury, the top part of the armour for the head, mounting over the helmet, in manner of a comb, or tuft of a cock, deriving its name from *crista*, a cock's comb. The crest

was for the most part made of feathers, or the hair of horses' tails or mains. The soldiers took great pride in adorning them. In most of the old monuments we find the crest represented, not much unlike those on the tops of our modern head-pieces: but whatever the common soldiers had, those of the officers were usually wrought in gold or silver, and the plumes of a larger size, quite across the helmet; and some wore two, three, or four together of these plumes.

CREST, in heraldry, the uppermost part of an armoury, or that part of the cask or helmet next to the mantle. Guillim says, the crest, or cognizance, claims the highest place, being seated on the most eminent part of the helmet; yet so as to admit of an interposition of some escrol, wreath, chapeau, crown, &c. The crest is esteemed a greater mark of nobility than the armoury, being borne at tournaments, to which none were admitted till such time as they had given proof of their nobility: sometimes it serves to distinguish the several branches of a family; and it has served, on occasion, as a distinguishing badge of factions; sometimes the crest is taken for the device; but more usually is formed of some piece of the arms. Families that exchange arms do not change their crest.

CREST-FALLEN, in the manege, a fault of an horse, when the crest hangs to one side. The cure is to place it upright, clipping away the spare skin, and applying plasters to keep it in a proper position.

CRETE, in ancient geography, one of the largest islands in the Mediterranean, lying between 22° and 27° Lon. E. and between 35° and 36° Lat. N. According to Strabo, this island is 287 miles in length; according to Pliny, 270; and according to Scylax, 312. As to its breadth, it is not, as Pliny observes, above 55 miles where widest; whence it was styled, as Stephanus observes, the Long Island. Anciently it was known by the names of Aeria, Chthonia, Curete, Idæa, Macaris, &c. but its most common name was Crete. Homer, the celebrated Grecian bard, thus describes this island as it stood in his time: "Crete is an extensive island in the midst of the stormy main. The soil is rich and fertile. It contains an immense number of inhabitants. It is adorned with 100 cities. Its inhabitants speak in various languages. We find there Achæans, valiant Eteocretes, Cydonians, Dorians, and god-like Pelasgians. Crete received its name from Cres, the first of its monarchs. He was author of several useful inventions, which contributed to the happiness of his subjects. Prompted by gratitude, they endeavoured to perpetuate the memory of his favours, and to immortalize his name, by naming the island after him. To distinguish the true Cretans from strangers, they were named Eteocretes. A number of colonies, from different parts of Greece, settled on the island. The agreeableness of the climate, and the fertility of the soil, invited them to fix their habitation there. The Lacedæmonians, Argives, and Athenians, were the principal people who sent colonies into Crete. The Eteocretes inhabited the southern division of the island; they built there the city of Præsus, and erected a temple to Dictæan Jove. Cres was not the only monarch who reigned in the island of Crete. He had a series of successors. But history affords little information concerning them; only the names of a few are preserved, and a small number of events which happened under the reign of some others, but blended and disfigured with an intermixture of fable. Among those monarchs we find two Jupiters, and two of the name of Minos. However, most writers confound them, and ascribe to one those transactions and exploits which should be shared between the two. Minos was esteemed the wisest legislator of antiquity. The office assigned him in the regions below, is a clear proof of his having gained an exalted reputation by his justice. Greece, says Plato, has with great propriety adopted the laws of Crete; for they are founded on the solid basis of reason and equity, and have a natural tendency to render the people, who live in subjection to them, opulent and happy. One of those laws forbade "the Cretans ever to carry their festivity so far as to intoxicate themselves with wine." The following was very suitable to repress the presumptuous ardour of youth, "Let young people not canvass the laws with an indiscreet curiosity; let them not examine whether the lawgiver has done right or wrong in promulgating them; but let them join unanimously in declaring them good, since they proceed from the gods. If any of the old men perceive something in them meriting amendment, let him men-

tion it to the magistrate, or discuss it with his equals, but never in the presence of the young people." That excellent code was engraved on tables of brass; and Talos, chief minister to Minos, visited all the towns and cities in the island, three times a year, to observe in what manner the laws were executed and obeyed. The king, knowing that the marvellous was necessary to command the belief and enforce the obedience of his people, pretended that he had received those laws from his father Jupiter, in the grotto of mount Ida. In opposition to this account, others of the ancients describe Minos as a prince abandoned to the fury of his passions, and a barbarous conqueror. Falling passionately in love with the nymph Dictynna, who refused to gratify his wishes, he pursued her to the brink of the shore, and forced her to plunge into the sea, where she was saved by some fishermen, who received her in their nets. He was the first of the Greeks who appeared in the Mediterranean at the head of a naval armament. He conquered the Cyclades, expelled the Carians, established Cretan colonies in those islands, and committed the government of them to his son. Being informed, at Paros, that his son Androgeus was slain at Athens, he declared war against Ægeus, and imposed on him a disgraceful tribute; from the payment of which Theseus delivered his country. He took arms against Nisus, king of Megara, made him prisoner by the treachery of his daughter Scylla, and put him to death, together with Megarus, the son of Hippomanes, who had brought some forces to his assistance. Dædalus, who had by some means incurred his displeasure, despairing of pardon from so severe and inflexible a prince, employed the resources of his inventive genius, to escape from his power. He fled to Sicily, gained the protection of king Cocalus, and obtained an asylum in his court. Valerius Flaccus has described his flight: "Thus Dædalus, with the wings of a bird, ascended from mount Ida. Beside him flew the comrade of his flight, with shorter wings. They appeared like a cloud rising in the air. Minos, seeing his vengeance thus eluded, glowed with impotent rage. In vain he followed with his eyes the secure flight of his enemies through the wide expanse of heaven. His guards returned to Gortynia with their quivers filled with arrows." The Cretan monarch did not, however, give up his prey. He equipped a fleet, pursued the fugitive to Sicily, and fell before the walls of Camicum. It is plain, that these actions do not agree to the character of the monarch, whose justice immortalized him. We may, therefore, reasonably conclude, that Minos the legislator is a different person from the conqueror; that it was the former who gained a lasting reputation by his wisdom and justice; and the latter who subdued most of the islands of the Archipelago, but tarnished his glory by his cruelty and merciless thirst for vengeance. The last king of Crete was Idomeneus, who conducted 24 ships (or according to Hyginus 40) to the assistance of Agamemnon. Homer informs us of the illustrious exploits by which he signalized himself before the walls of Troy. At his departure from Crete, he committed the government to Leucus his adopted son, promising him the hand of his daughter Clisithera if he governed wisely in his absence. But Leucus forgot these favours, and aspired to the immediate possession of the crown, without waiting till he should obtain it lawfully by marriage. Mida, wife to Idomeneus, and the princess Clisithera, were obstacles to his wishes. But ambition knows no restraint, and tramples under foot the most sacred obligations. Having seduced the people from their allegiance, and gained over the nobles, he sacrificed those unfortunate victims in the temple. When Idomeneus, crowned with laurels, landed on the coast of Crete, Leucus, who had now firmly established his power, attacked him with an armed force, and obliged him to reembark. Servius indeed gives a different account of the banishment of Idomeneus, and says, that he had vowed, in a storm, to sacrifice to the gods the first person that his eyes should behold on the Cretan shore; that his son having met him first after his arrival, he fulfilled his vow, by sacrificing him; and that the island being soon after depopulated by pestilence, the inhabitants looked upon that affliction as the effect of divine vengeance, and expelled the parricide; who, retiring to Italy, founded Salentum, on the Messapian coast. But that opinion appears entirely groundless. History mentions no son of Idomeneus. If he had one, why did he adopt Leucus? The most probable opinion is, that the plague was introduced into the island by his ships, when he returned from the siege of Troy, as Herodotus asserts; and that Leucus artfully made use of that pretext

pretext to expel his lawful sovereign from the island. But the usurper did not long enjoy the fruit of his crimes. Soon after the departure of Idomeneus, monarchy was abolished, and Crete became a republic. The republic of Crete has been celebrated by the panegyric of Plato, served Lycurgus as a model for that which he established in Lacedæmon, and was beloved by all Greece with admiration. Strabo has thought it not unworthy of his pencil, and has consecrated the leading features of its constitution to lasting fame in his immortal work. It was indeed a system of legislature, whose direct tendency was to call forth the buds of virtue in the heart of infancy; to open and expand them in youth; to inspire man, as he reached maturity, with the love of his country, of glory, and of liberty; and to comfort the infirmities of age with the respect and esteem due to the experience and wisdom of that period of life. It tended to form affectionate friends, patriotic citizens, and worthy magistrates. It made no use, however, of a multitude of acts and statutes to produce those inestimable advantages. They flowed all from one source; the public education of youth, judiciously directed. The virtuous examples set before youth in the course of that education; the illustrious deeds which were recited to them with high applause, the honours conferred on valour and on noble actions, the opprobrium invariably cast on vice; these were the only means which the Cretan lawgiver made use of to form a warlike, humane, and virtuous nation. The Cretan government, soon after the expulsion of Idomeneus, became partly aristocratical. The power was divided between the nobles and the people. Yet as the chief employments were occupied by the nobles, they directed the administration of affairs. Ten magistrates were annually elected, by a majority of voices, in the national assembly. These were named Cosmoi, and their public office and character were the same with those of the Ephori at Sparta. They were the generals of the republic in time of war, and directed all affairs of any importance. They had the right of choosing certain old men for counsellors. Those old men, to the number of 28, composed the Cretan senate. They were chosen from among such as had discharged the office of Cosmoi, or had distinguished themselves by extraordinary merit and blameless probity. These senators continued in office during life, possessed a weighty influence, and were consulted in every affair of importance. This body was a barrier against the ambition of the ten chief rulers. Another restraint on their power was the limiting of their administration to one year. As the suffrages of the people might be obtained by bribery or personal influence, and as their choice might sometimes fall on a man unworthy of so honourable an office, he who had been thus undeservedly advanced to the dignity of Cosmes was degraded, either in a national assembly, or simply by the voices of his colleagues. This, doubtless, is what Plato alludes to, when he says, "Neither the commonwealth, which approaches too near to a monarchical constitution, nor that which affects a licentious liberty, is founded on the solid basis of a just medium between anarchy and despotism. O Cretans! Lacedæmonians! by establishing yours on firmer foundations, you have avoided those fatal extremes. Such were the distribution of power and the administration of public affairs in the Cretan government. Its simplicity was admirable. A people who were blessed with the sacred enjoyment of liberty, but possessed not sufficient knowledge and discernment to direct themselves, elected magistrates to whom they delegated their authority. These magistrates, thus arrayed with sovereign power, chose senators to assist and direct their deliberations. These counsellors could neither enact or decide of themselves; but they held their office for life; and that circumstance contributed to strengthen their influence and to increase their experience. The magistrates were animated by the most powerful motives to distinguish themselves when in office, by unwearied activity in the public service. On one side, they were restrained by the fear of degradation; on the other, actuated by the hope of becoming one day members of the national council. "The legislator, says Strabo, considered liberty as the greatest blessing that cities can enjoy. Liberty alone can secure the property of the citizens of any state. Slavery either robs them of it, or renders it precarious. The first care of nations should therefore be to preserve their liberty. Concord strengthens and supports her empire; she flourishes wherever the seeds of dissention are extinguished. Almost all those hostilities which prevail among nations or individuals spring either from an inordinate desire of

wealth or the love of luxury. Introduce, instead of those baneful principles, frugality, moderation, and equality of conditions; you will thus banish envy, hatred, injustice, and haughty disdain." This was what the Cretan lawgiver happily effected. And the community, which was regulated by his wise institutions, rose to glory, opulence, and power; and was honoured with the panegyrics of the most celebrated philosophers of Greece. But the highest honour it ever obtained, was that of serving Lycurgus as a model for the form of government, which he established at Sparta. The republic of Crete continued to flourish till the age of Julius Cæsar. No other state has enjoyed so long a period of strength and grandeur. The legislator, regarding liberty as the only sure basis of a nation's happiness, had instituted a system of laws, the natural tendency of which was, to inspire men with an ardent passion for liberty, and with such virtue and valour as are necessary to support and defend it. All the citizens were soldiers; all skilled in the art of war. The valiant youth of other nations resorted to Crete, to learn the exercises, manœuvres, and evolutions, of the military art. Philopœmen (says Plutarch) to acquire skill in arms, embarked for Crete. When he returned to the Achæans, the knowledge he had acquired made him so eminent among them, that he was immediately appointed general of their cavalry. On the other hand, the legislator, being persuaded that conquests are generally unjust and criminal, that they often exhaust the strength of the victorious nation, and almost always corrupt its manners, endeavoured to preserve the Cretans from the ambition of conquest. The fertility of the island abundantly supplied their wants. They needed not that commerce should introduce among them the riches of foreign countries, along with which luxury and her train of attendant vices would also be introduced; and he inspired them with an indifference for such acquisitions, without expressly forbidding them. The gymnastic exercises, which occupied the leisure of the gallant youths; the pleasures of the chase; the ardour of friendship; the public shews, at which both men and women assembled; the love of equality, order, and their country, with which he inflamed every breast; the wise institutions, which united a whole nation so closely that they seemed to compose but one family;—all these ties attached the Cretans to their native island; and finding happiness at home, they never thought of wandering abroad in search of imaginary glory, or of extending their empire over other nations. Therefore, from the period at which that state assumed a republican form, till the time when they were attacked by the Romans, the nation was not once known to send an hostile force into the territories of any of their neighbours. This instance of moderation is unparalleled in history; no other nation can divide the glory of it with the Cretans. Individuals indeed might leave their country to engage in foreign armies. Those princes and states, who knew their valour and skill in archery, eagerly sought to take them into their pay; all the neighbouring monarchs were desirous of having in their armies a body of Cretan archers. But though the independent cities which flourished in Crete did not unite their arms to subjugate the neighbouring islands, yet they were not so wise as to live in peace among themselves. Sometimes Gnosus and Gortynia marched with social banners against their neighbours, levelled their fortresses, and subjected them to their power; at other times they attacked each other with hostile violence, and saw their bravest youth perish amid the horrors of civil war. Lyctos and Cydon opposed an invincible barrier to their ambition, and preserved their own liberty. The last of these cities had acquired such strength and influence, that she held the balance between the rival powers of the island. These wars destroyed a number of the cities, and drenched the native country of Jupiter with blood. It is difficult to trace the source of those intestine dissensions. Part of the island was occupied by the Eteocretes, the original inhabitants; the rest was peopled with colonies from Athens, Sparta, Argos, and Samos. Perhaps the ancient grudges, which had subsisted among those strangers, were rekindled by accident, and inflamed with new fury. The most powerful among them, would endeavour to take advantage of the weakness of the rest, and disregarded all laws but those of force; and the glowing ardour of the youth, trained to military exercises, would be ever ready to fly to arms. Such, probably were the causes which fomented discord and hostility among a people living under the same religion, customs, and laws. Whatever these might be, the

the Cretans, being persuaded that the firm union of their soldiers was essential to victory, arrayed the bravest youths of the army in splendid robes, and caused them to sacrifice to Friendship before engaging in battle. In some countries it would be very proper to oblige the generals, on such occasions, to sacrifice to Concord. Nations are effaced from the earth like the monuments of their power, and after the revolution of several ages we can scarce trace in their posterity any remains of their ancient character. Some of them exist longer, others shorter; but we may almost always calculate the period of their duration by the excellence of their laws, and the fidelity with which they support and obey them. The republic of Crete, being established on a solid basis, knew no foreign master for a period of ten centuries. She bravely repelled the attacks of those princes who attempted to enslave her. At length the time arrived when the warlike and victorious Romans would suffer none but their subjects or slaves to inhabit within the reach of their arms. Florus acknowledges, that the Romans had no other motive for invading Crete but the ambition of subduing the renowned native country of Jupiter. "If any person wish to know the reasons which induced us to attack Crete (says he), the true reason was our desire to subdue so celebrated an island. The Cretans had appeared to favour Mithridates, and the Romans thought proper to declare war against them on that pretext. Mark Antony, father of the triumvir, attacked them with strong hopes of success; but was severely punished for his presumption and imprudence. The Cretans took a great part of his fleet, hung up his soldiers and sailors on the masts amid the sails and cordage, and returned in triumph into their harbours." The Romans never forgot nor forgave a defeat. As soon as the Macedonian war was brought to a conclusion, they took arms against the Cretans to revenge their ignominy and loss. Q. Metellus was sent to Crete with a powerful armament. He met with an obstinate and vigorous resistance. Panarus and Lathenes, two experienced leaders, collecting a body of 20,000 young warriors, all eager for battle, and of determined courage, employed their arms successfully against the Romans, and protracted the fate of Crete for three years. These conquerors could not make themselves masters of the island till they had destroyed its bravest warriors. They lost a great number of troops, and bought a bloody victory at the price of many a danger and much fatigue. However, their usual good fortune at length prevailed. The first care of the conqueror was to abolish the laws of Minos, and to establish those of Numa. Strabo, that enlightened philosopher, complains of this act of severity; and informs us, that in his days the original laws of Crete were no longer in force, because the Romans compelled the conquered provinces to adopt their civil code. To secure themselves still more fully in the possession of the island, they sent a powerful colony to Gnossus. From the conquest of Crete by the Romans, to the present time, that is, for a period of 1900 years, the Cretans have no longer formed a separate nation, nor made any figure among the states and kingdoms of the world: their noble and ingenious manners, their arts and sciences, their valour and their virtues, are no more. They lost these with their liberty. So true it is that man is not born for himself; and that, when deprived of that aid which Nature has designed to strengthen and support his weakness, the flame of genius and the ardent glow of valour are extinguished in his breast; he becomes incapable of vigorous resolution, and sinks below the natural virtue and dignity of the species. The island of Crete, joined with the small kingdom of Cyrene, on the Lybian coast, formed a Roman province. It was at first governed by a proconsul; a questor and an assistant were afterwards sent there; at last, it was put under the government of a consul. It was one of the first islands, that were favoured with the light of the gospel. St. Paul introduced the Christian faith into it; and his disciple Titus, whom he left there to cultivate that precious plant, became the first bishop of the island. In the reign of the emperor Leo, it had 12 bishops, all subject to the patriarch of Constantinople. Constantine separated Crete from Cyrene, in the new division which he made of the provinces of the empire: and left Crete, with Africa and Illyria, to his third son, Constans. In the reign of Michael II. emperor of Constantinople, a rebellion, which lasted three years, caused him to neglect the other parts of the empire. The Saracens, who had conquered the finest provinces of Spain, seized

that opportunity. They fitted out a considerable fleet, plundered the Cyclades, attacked the island of Crete, and made themselves masters of it without opposition. To secure their conquest, they built a fortress which they named Khandak, *i. e.* intrenchment. From that citadel they made inroads into the interior parts of the island, carrying havoc and devastation wherever they appeared. By repeated attacks, they subdued all the cities in Crete except Cydon. Michael made some ineffectual efforts to expel them from Crete. The emperor Basilus I. was not more successful. They defeated him in a bloody battle; but being vanquished by one of his generals, they were subjected to the payment of an annual tribute. At the end of 10 years the Arabians refused the tribute. It was reserved for Nicephorus Phocas, afterwards emperor, to deliver this fine island from the yoke of the infidels. He landed on it with a numerous army, boldly attacked them, and routed them in various engagements. The Saracens, no longer daring to meet so formidable a general in the field, fled for protection to their fortresses. Phocas being plentifully supplied with all the warlike machines necessary for a siege, levelled their walls, took their cities and fortresses, and drove them into Khandak, their metropolis. In nine months he subdued the whole island, took their king Curup, and his lieutenant Aremast, prisoners, and reunited to the empire a province which had been 127 years in the hands of the infidels. It remained under the dominion of the Romans till the time when Baldwin E. of Flanders, being raised to the throne, liberally rewarded the services of Boniface Marquis of Montserrat, by making him king of Thessalonica, and adding the island of Crete to his kingdom. That lord, being fonder of gold than glory, sold it to the Venetians, A. D. 1194; under whom it assumed the name of Candia. See that article.

CRETIO, in antiquity, a certain number of days allowed the heir, to consider whether he would act as heir to the deceased or not; after which time, if he did not act, he was excluded from the estate.

CREVECŒUR, a town and fortress of Holland, in the province of Holland, 20 miles E. of Breda.

CREVECŒUR, two towns of France; viz. 1. in the department of Calvados: 2. in the department of the North.

CREVIER, JOHN BAPTIST LEWIS, a native of Paris, trained under the celebrated Rollin, and afterwards professor of rhetoric. Upon the death of his master, in 1741, he finished his "Roman History." He published other works, and was greatly serviceable to the cause of virtue and religion, as well as letters. His death happened in 1765, at a very advanced age. Besides the continuation of Rollin, he published, 1. An edition of Livius, cum Notis, in six vols. 4to. 1748: and afterwards another, for the use of his pupils, in six vols. small 8vo. 2. La Histoire des Empereurs de Romains Jusqu' a Constantin, 1749, 12 tom. 12mo. 3. Histoire de l'Université de Paris, 7 tom. 12mo. 4. Rhetorique Francoise, a just and useful work. 5. Observations sur l'Esprit des Loix.

CREUSA, a daughter of Priam, king of Troy, by Hecuba. She married Aeneas, by whom she had Ascanius.

CREUSE, a department of France. It contains the late province of Marche. Gueret is the capital.

CREUSE, a river of France, which rises eight miles S. of Fullentin, crosses the department, and that of Indre; and falls into the river Vienne.

CREUTZ, a town of Croatia, 16 miles S. S. E. of Varasdin.

CREUTZENACH, CREUTZNACH, or KREUTZNACH, a town of Germany, in the circle of the Upper Rhine, 20 miles S. W. of Meatz.

CREUX, a French term used among artificers, and literally signifying a hollow cavity, or pit, out of which something has been scooped or dug; whence it is used to signify that kind of sculpture, where the lines and figures are cut and formed within the face or plan of the plate, or matter engraved; and thus it stands in opposition to relieve, where the lines and figures are embossed, and rise prominent above the face of the matter engraved on.

CREW, the company of sailors belonging to a ship, boat, or other vessel. The sailors that are to work and manage a ship, are regulated by the number of lasts it may carry, each last making two tons. The crew of a Dutch ship, from forty to fifty lasts, is seven sailors and a swabber; from fifty to sixty lasts, the crew

consists of eight men and a swabber; and thus increases at the rate of one man every ten lasts. English and French crews are usually stronger than Dutch, but always in about the same proportion. There are in a ship several particular crews or gangs, as the gun-room crew, the carpenter's crew, &c.

CREWKERN, or **CREWKERNE**, a town of England, in Somersetshire, on the borders of Dorsetshire, a mile from the Parret.

CREX, in ornithology. See **RALLUS**.

CRIBBAGE, a game at cards.

CRIBRARIA, in botany, a genus of the cryptogamia fungi: case furnished with a double membrane, the outer one thin and fugacious, inner one reticulate; seeds without filaments, ejected through the foramina. One species, viz. the pallida.

CRICELASIA, the driving of a ring or hoop. Driving a hoop was one of the ancient gymnastics: this hoop was as high as the breast of the person who used it. It was commended for rendering the limbs pliable, and for strengthening the nerves.

CRICHTON, **JAMES**, a celebrated Scotchman, of whom so many wonderful things are related as to have procured him the name of "the admirable Crichton." He was born about 1550, in the county of Perth, of a good family, and educated at St. Andrews, where he made a rapid progress in the languages and sciences. At the age of twenty he visited Paris, and acquired uncommon reputation as a disputant, and for his skill and activity in games of all sorts, as well as martial exercises. It is said that he caused placards to be fixed on all the gates of the schools, halls, and colleges, belonging to the university, and on all the pillars and posts before the houses of the most renowned men for literature in the city, inviting all those who were well versed in any art or science, to dispute with him in the college of Navarre, that day six weeks, by nine o'clock in the morning, where he would attend them, and be ready to answer to whatever should be proposed to him, in any art or science; and in any of these twelve languages, Hebrew, Syriac, Arabic, Greek, Latin, Spanish, French, Italian, English, Dutch, Flemish, and Sclavonian; and this either in verse or prose at the discretion of the disputant. During this whole time, instead of closely applying to his studies, he regarded nothing but hunting, hawking, tilting, vaulting, riding, tossing the pike, handling the musket, and other military feats; or else he employed himself in domestic games, such as balls, concerts of music vocal and instrumental; cards, dice, tennis, and the like diversions. This conduct so provoked the students of the university, that under the placard which was fixed on the Navarre gate, they caused the following words to be placed: "If you would meet with this monster of perfection, to make search for him either in the tavern or bawdy-house, is the readiest way to find him." Nevertheless, when the day appointed arrived, Crichton appeared in the college of Navarre, and acquitted himself beyond expression in the disputation, which lasted from nine o'clock in the morning till six at night. At length, the president, after extolling him highly for the many rare and excellent endowments, which the Almighty had bestowed upon him, rose from his chair, and, accompanied by four of the most eminent professors of the university, gave him a diamond ring, and a purse full of gold, as a testimony of their esteem. The whole ended with the repeated acclamations of the spectators; and henceforward our young disputant was called The admirable Crichton. It is added, that he was so little fatigued with the dispute, that he went on the very next day to the Louvre, where he had a match of tilting, and in the presence of some of the French princes, and many ladies, carried away the ring fifteen times successively. About two years after this we find him at Rome, where he affixed a placard upon all the eminent places of the city, in the following terms: "Nos Jacobus Crichtonus Scotus, cuicumque rei propositæ ex improviso respondebimus. In a city which abounded in wit, this bold challenge, to answer to any question that could be proposed to him, without his being previously advertised of it, could not escape the ridicule of a pasquinade. It is said, however, that being nowise discouraged, he appeared at the time and place appointed; and that, in the presence of the pope, many cardinals, bishops, doctors of divinity, and professors in all the sciences, he displayed such wonderful proofs of his universal knowledge, that he excited no less surprise than he had done at Paris. From Rome he went to Venice; where he contracted an intimate friend-

ship with Aldus Manutius, Laurentius Massa, Speron Speronius, Johannes Donatus, and other learned men, to whom he presented several poems in commendation of the city and university. At length he was introduced to the Doge and Senate, in whose presence he made a speech, which was accompanied with such eloquence, and grace of person and manner, that he received the thanks of that illustrious body; and nothing was talked of through the whole city but this *rara avis in terris*, this prodigy of nature. He held, likewise, disputations on theology, philosophy, and mathematics, before the most eminent professors, and large multitudes of people. His reputation was so great, that the desire of seeing and hearing him brought together a vast concourse of persons from different quarters to Venice. At Padua he disputed for six hours with the most celebrated professors on various subjects of learning; and he exposed, in particular, the errors of Aristotle and his commentators, with so much solidity and acuteness, and at the same time with so much modesty, that he excited universal admiration. In conclusion he delivered extempore an oration in praise of ignorance, which was conducted with such ingenuity and elegance, that his hearers were astonished. This exhibition of Crichton's talents was on the 14th of March 1581. He caused a paper to be fixed on the gates of St. John and St. Paul's church, wherein he offered to prove before the university, that the errors of Aristotle, and of all his followers, were almost innumerable; and that the latter had failed both in explaining their master's meaning, and in treating on theological subjects. He promised likewise to refute the dreams of certain mathematical professors; to dispute in all the sciences; and to answer to whatever should be proposed to him or objected against him. All this he engaged to do, either in the common logical way, or by numbers and mathematical figures, or in 100 sorts of verses, at the pleasure of his opponents. According to Manutius, Crichton sustained this contest, without fatigue, for three days; during which time he supported his credit, and maintained his propositions, with spirit and energy, and with the highest applause from an unusual concourse of people. We next find him at Mantua, where he is reported to have slain a famous fencing-master in a duel. The duke of Mantua was so pleased with Crichton as to appoint him tutor of his son, who was a very licentious young man. This appointment, however, proved fatal to him; for one night, as he was walking through the streets in carnival time, he was attacked by six assassins, and after a gallant defence lost his life. It is said that the person who gave him the fatal stroke was the prince, his pupil. This event is placed in the year 1583. The following catalogue of Crichton's works is given by Dempster: 1. *Odæ ad Laurentium Massam plures.* 2. *Laudes Patavinae, Carmen extempore effusum, cum in Jacobi Aloysii Cornelli Domo Experimentum Ingenii, coram tota Academia Frequentia, non sine multorum Stupore, faceret.* 3. *Ignorantia Laudatio, extemporale Thema ibidem redditum, post sex Horarum Disputationes, ut, præsentibus Somnia potius fovere quam Rem se veram videre affirmarint, ait Manutius.* 4. *De Appulsu suo Venetias.* 5. *Odæ ad Aldum Manutium.* 6. *Epistolæ ad Diversos.* 7. *Prefationes solennes in omnes Scientias sacras et profanas.* 8. *Judicium de Philosophis.* 9. *Errores Aristotelis.* 10. *Arma an Literæ præstant? Controversia Oratoria.* 11. *Refutatio Mathematicorum.* 12. *A Comedy in the Italian language.*

CRICK, among farriers, is when a horse cannot turn his neck any way, but holds it fore right, insomuch that he cannot take his meat from the ground without great pain.

CRICKET, an exercise or game, performed with bats and a ball. This sport was formerly confined solely to the labouring class of people, but is now becoming daily more fashionable among those, whose rank and fortune entitle their countrymen to expect a very different conduct. Although we have, on all occasions, enjoined proper muscular exercise, yet we strongly reprobate that of cricket, which is in all respects too violent, and, from the positions into which players must necessarily throw themselves, cannot fail to be productive of frequent injury to the body.

CRICKET, in zoology. See **GRYLUS**.

CRICKHOWEL, a town of South Wales in Brecknockshire, on the Usk, 6 miles W. N. W. of Abergavenny.

CRICKLADE, a borough of Wiltshire, 26 m. S.W. of Oxford.

CRICKLIETH, an ancient town of North Wales, in Caernarvonshire.

CRICO-

CRICO-ARYTENOIDEUS, two muscles of the larynx. See **ANATOMY**.

CRICOIDES, in anatomy, a cartilage of the larynx, called also the annular cartilage. It occupies the lowest part by way of base to the rest of the cartilages, and to the lower part of it the *aspera arteria* adheres. See **ANATOMY**.

CRICO-THYROIDÆUS, one of the five proper muscles of the larynx. See **ANATOMY**.

CRIME, [*crimen*, Lat.] the transgression of a law, either natural or divine, civil or ecclesiastic. Civilians distinguish between *crimen* and *delictum*. By the first, they mean capital offences, injurious to the whole community, as murder, perjury, &c. the prosecution of which was permitted to all persons, though no ways immediately interested. By the latter, they understood private offences committed against individuals, as theft, &c. By the laws, nobody was allowed to prosecute in these, except those interested. With us, crimes are distinguished into capital, as treason, murder, robbery, &c. and common, as perjuries, &c. Again, some crimes are cognizable by the king's judges, as the above-mentioned; and others are only cognizable in the spiritual courts, as simple fornication. All the pleas and excuses, which protect the committer of a forbidden act from the punishment which is otherwise annexed thereto, may be reduced to this single consideration, the want or defect of will. An involuntary act, as it has no claim to merit, so neither can it induce any guilt: the concurrence of the will, when it has its choice either to do or to avoid the fact in question, being the only thing that renders human actions either praiseworthy or culpable. Indeed, to make a complete crime, cognizable by human laws, there must be both a will and an act. For though, in *foro conscientie*, a fixed design or will to do an unlawful act is almost as heinous as the commission of it; yet as no temporal tribunal can search the heart, or fathom the intentions of the mind, otherwise than as they are demonstrated by outward actions, it therefore cannot punish for what it cannot know. For which reason, in all temporal jurisdictions, an overt act, or some open evidence of an intended crime, is necessary in order to demonstrate the depravity of the will, before the man is liable to punishment.

CRIMEA. See **TARTARY**.

CRIMNOIDES, or **CRIMOIDES**, among physicians, a term sometimes used for the sediment of urine, resembling bran.

CRIMSON, one of the seven red colours of the dyes. See **DYEING**.

CRINGLE, [from *krinckelen*, Belg. to run into twists,] a small hole made in the bolt rope of a sail, by intertwisting one of the divisions of a rope, called a strand, alternately round itself and through the strands of the bolt-rope, till it becomes three-fold, and assumes the shape of a wreath or ring. The use of the cringle is generally to contain the end of some rope, which is fastened thereto for the purpose of drawing up the sail to its yard, or of extending the skirts by the means of bridles, to stand upon a side wind.

CRINODENDRUM, in botany, a genus of the monadelphia decandria class and order. Calyx none; corolla bell-shaped, six-petaled; capsule one-celled, gaping elastically at top. One species, viz. *C. patagua*, a beautiful evergreen branchy tree, with a body seven feet in diameter. It is a native of Chili.

CRINUM, in botany, a genus of the hexandria monogynia class and order; natural order, *Spathaceæ*. Corolla funnel-form, monopetalous, six-parted, three alternate segments unciate; germ at the bottom of the corolla, covered; stamina distant. There are six species.

CRISIS, [*κρίσις*, Gr.] in medicine, is used in different senses, both by the ancient and modern physicians. With some it means frequently no more than the excretion of any noxious substance from the body. Others take the word for a secretion of the noxious humours made in a fever. Others use it for the critical motion itself; and Galen defines a crisis in fevers, a sudden and instantaneous change, either for the better or the worse, productive of recovery or death.

CRISTÆ, in surgery, excrescences about the anus and pudentia.

CRISTA GALLI. See **ANATOMY**. This process is so named from its figure, which resembles a cock's comb. To it is fastened

that part of the dura mater which divides the brain, called *falx*. In adults, this process appears of a piece with the septum narium.

CRITERION, [*τὸ κριτήριον*, Gr.] a mark by which any thing is judged of, with regard to its goodness or badness.

CRITERION, in logic, a standard by which propositions and opinions are compared, to discover their truth or falsehood.

CRITHE, in surgery, commonly called the styte, a sort of tubercle that grows on the eyelids.

CRITHMUM, **SAMPHIRE**: a genus of the digynia order, and pentandria class of plants; natural order, *Umbellatæ*. Fruit oval, compressed; florets equal. There are three species.

CRITHOMANCY, [from *κριθή*, barley, and *μαντεία*, magic,] a species of divination, by considering the dough or matter of the cakes offered in sacrifice, and the meal strewed over the victims to be killed. Barley meal was commonly used; whence the name.

CRITICAL DAYS, or **CRITICAL SYMPTOMS**, among physicians, are certain days and symptoms in the course of acute diseases, which indicate the patient's state, and determine him either to recover or grow worse. See **MEDICINE**.

CRITICISM, [from *κριτικός*, Gr.] the art of judging with propriety, concerning any object or combination of objects. But in a more limited sense, the science of criticism is confined to the fine arts. The principles of the fine arts are best unfolded by studying the sensitive part of our nature, and by learning what objects are naturally agreeable and what are naturally disagreeable. The man who aspires to be a critic in these arts, must pierce still deeper: he must clearly perceive what objects are lofty, what low, what are proper and improper, what are manly, and what are mean or trivial. Hence a foundation for judging of taste, and for reasoning upon it: where it is conformable to principles, we can pronounce with certainty that it is correct; otherwise, that it is incorrect, and perhaps whimsical. Thus the fine arts, like morals, become a rational science; and, like morals, may be cultivated to a high degree of refinement. Notwithstanding the ignorance and insolence which have occasionally disgraced the writings of professed critics of minor rank, and notwithstanding the sneers of one of the wittiest of English authors against what he denominates the "cant of criticism," and his memorable eulogium of those who "are pleased they know not why, and care not wherefore," the art of criticism is founded in nature, and every man of thinking mind is led to the practice of that art. The merits or demerits of literary works are a perpetual subject of comment, and the intelligent reader is not contented with referring to his own immediate feelings as the grounds of his verdict, but appeals to certain principles which he regards as established, and which he quotes as the guides of opinion.

CRITICISM may be regarded as embracing three separate branches: 1st. The establishing of rules and principles for correct composition; such are the incomparable treatises of Cicero and Quintilian upon oratory, and of Longinus on the sublime. In English we have many valuable essays and treatises of this class. The prefaces of Mr. Dryden are a rich mine of critical principles finely illustrated. Some of Mr. Addison's papers in the *Spectator*, and Mr. Pope's and Dr. Johnson's prefaces to Shakspeare, are excellent specimens of rational criticism. In more modern times we have had some excellent compendiums of criticism: among which Lord Kaimes's *Elements of Criticism*, Dr. Blair's *Lectures*, Dr. Priestley's *Lectures on Oratory and Criticism*, and particularly bishop Lowth's *Lectures on the Sacred Poetry of the Hebrews*, deservedly hold a very high rank. See the articles **RHETORIC** and **POETRY**. The second branch of critical science relates to the commenting upon ancient authors, explaining difficult passages, and elucidating their beauties. Eustathius and the scholiasts, Vida, Scaliger, the Stephenses, and, above all, the gentlemen of Port Royal, have been great benefactors to the public in this way. The delphin and variorum editions of the classics do great credit to the learned persons by whom they were edited. Many editions of Shakspeare have been published with critical notes in this country. Mr. Theobald's was better than Mr. Pope's, except for the preface. Dr. Warburton entirely failed, for the same reason as Dr. Bentley in his edition of Milton, viz. indulging too freely in conjectural criticism. Dr. Johnson's explanatory notes on Shakspeare are excellent; and the profound reading of Malone, Steevens,

Steevens, and Farmer, in British and Saxon literature, have been excellently applied to the illustration of the first of dramatic poets. The third branch of criticism regards the forming of a correct judgement of the merits and demerits of contemporary writers. In this every man of education ought to qualify himself to see with his own eyes, and determine with his own understanding; and this is to be effected by the attentive study of the best works, ancient and modern, on the general principles of criticism (see above.) For to form our judgement on that of any other men is a species of literary slavery. The various partialities and conflicting interests by which mankind are governed, render it also very unsafe to rest our opinion upon that of others: and it is peculiarly unfortunate that this department of literature is seldom exercised by persons adequate, from education and experience, to the task. Where it is, there is no reason why the name of the critic should not be as public as that of the author; when that is not the case, his motive will be suspected: nor can the reader assent to observations from an authority, of the competency of which he is not assured. For these reasons but little credit is attached, except in remote country places, to anonymous criticism. The great vices of modern criticism are pertness and flippancy. Writers of this class seem to consider the study of Joe Miller as of more importance to their craft than that of Quintilian; and a readiness in the art of punning, as the highest praise and principal qualifications of a critic. manifold are the advantages of criticism, when studied as a rational science. I. A thorough acquaintance with the principles of the fine arts redoubles the entertainment these arts afford. To the man who resigns himself entirely to sentiment or feeling, without interposing any sort of judgement, poetry, music, and painting, are mere pastime; in the prime of life, indeed, they are delightful, being supported by the force of novelty and the heat of imagination: but they lose their relish gradually with their novelty; and are generally neglected in the maturity of life, which disposes to more serious and more important occupations. To those who deal in criticism as a regular science, governed by just principles, and giving scope to judgement as well as to fancy, the fine arts are a favourite entertainment; and in old age maintain that relish which they produced in the morning of life. II. A philosophical inquiry into the principles of the fine arts, inures the reflecting mind to the most enticing sort of logic: the practice of reasoning upon subjects so agreeable tends to a habit; and, habit strengthening the reasoning faculties, prepares the mind for entering into subjects more difficult and abstract. To have, in this respect a just conception of the importance of criticism, we need but reflect upon the common method of education; which, after some years spent in acquiring languages, hurries us, without the least preparatory discipline, into the most profound philosophy. A more effectual method to alienate the tender mind from abstract science, is beyond the reach of invention; and accordingly, with respect to such speculations, the bulk of our youth contract a sort of hobgoblin terror, which is seldom, if ever, subdued. Those who apply to the arts are trained in a very different manner: they are led, step by step, from the easier parts of the operation to what are more difficult; and are not permitted to make a new motion till they be perfected in those which regularly precede it. The science of criticism appears then to be a middle link, connecting the different parts of education into a regular chain. This science furnishes an inviting opportunity to exercise the judgement: we delight to reason upon subjects that are equally pleasant and familiar; we proceed gradually from the simpler to the more involved cases: and in a due course of discipline, custom, which improves all our faculties, bestows acuteness upon those of reason, sufficient to unravel all the intricacies of philosophy. III. The last and most important advantage of rational criticism is that it is a great support to morality. No employment attaches a man more to his duty, than that of cultivating a taste in the fine arts: a just relish of what is beautiful, proper, elegant, and ornamental, in writing or painting, in architecture or gardening, is a fine preparation for the same just relish of these qualities in character and behaviour. To the man who has acquired a taste so acute and accomplished, every action wrong or improper must be highly disgusting: if, in any instance, the overbearing passion sway him from his duty, he then turns to it upon the first reflection, with redoubled resolution never to be swayed a second time; he has now an additional motive to virtue, a conviction derived from experience, that happiness depends on regularity and order, and that a dis-

regard to justice or propriety never fails to be punished with shame and remorse.

CRITICISM, RULES OF. For these, as applicable to the fine arts, and derived from human nature, see **ARCHITECTURE, BEAUTY, COMPARISON, CONGRUITY, GRANDEUR, PROPRIETY, &c.**

CRITIC, a man skilled in the art of judging of literature; a man able to distinguish the faults and beauties of writing.

CRITIQUE, a criticism. See **CRITICISM**.

CRITO, an Athenian philosopher, who flourished B. C. 400. He was one of the most zealous disciples of Socrates, and supplied him with whatever he wanted. He had several scholars who proved great men, and he composed some dialogues which are lost.

CRIZZELLING, in the glass trade, a kind of roughness arising on the surface of some kinds of glass.

CROATIA, a country of Europe, and part of the ancient Illyricum, bounded on the E. by Slavonia and Bosnia, on the S. and S. W. by Morlachia, on the W. by Carniola, and on the N. by the Drave, which separates it from a part of Slavonia. It is about 80 miles long and 70 broad. The soil, where cultivated, is fruitful in wine and oil, &c. but being a frontier country, it is not so well cultivated as otherwise it might be. Carlstadt is the capital.

CROCODILE, in rhetoric, a captious and sophistical kind of argumentation, contrived to seduce the unwary, and draw them speciously into a snare. It has its name from the following fable, invented by the poets. A poor woman begging a crocodile, that had caught her son walking by the river-side, to spare and restore him, was answered, that he would restore him, provided she should give a true answer to a question he should propose: the question was, Will I restore thy son or not? To this the poor woman, suspecting a deceit, sorrowfully answered, Thou wilt not: and demanded to have him restored, because she had answered truly. Thou lyest, says the crocodile; for if I restore him thou hast not answered truly: I cannot therefore restore him without making thy answer false.

CROCODILE, in zoology. See **LACERTA**.

CROCODILE, FOSSILE, one of the greatest curiosities which have been discovered in the fossile world. It is the skeleton of a large crocodile, almost entire, found at a great depth under ground, bedded in stone. It was in the possession of Linkius, who wrote many pieces of natural history, and particularly an accurate description of this curious fossile. It was found in the side of a large mountain in Germany, and in a stratum of black fossile stone, somewhat like our common slate, but of a coarser texture, the same with that in which the fossile fish in many parts of the world are found. It had the back and ribs very plain, and was of a much deeper black than the rest of the stone; as is the case in the fossile fishes, preserved in this manner. The part of the stone where the head lay was not found; being broken off just at the shoulders, but irregularly; so that, in one place, a part of the back of the head was visible in its natural form. The two shoulder-bones were very fair, and three of the feet were well preserved; the legs were of their natural shape and size, and the feet preserved even to the extremities the five toes of each.

CROCUS, in botany, **SAFFRON**: a genus of the monogynia order, and triandria class of plants; natural order, **Ensata**. Corolla sex-partite, equal; stigmata convoluted or rolled spirally inwards. There are two species with many varieties, viz. *C. officinalis*, officinal crocus, or saffron, and *C. vernus*, or spring crocus.

CROCUS, in chemistry, any metal calcined to a red or deep yellow colour.

CRÆSUS, the last king of Lydia, remarkable for his riches, his conquests, his temporary prosperity, and his sad reverse of fortune. He subdued the Phrygians, Mysians, Paphlagonians, Thracians, and Carians; amassed together immense riches; and became one of the most powerful and magnificent princes in the world. He drew the learned to his court, and took a pleasure in conversing with them. Thales of Miletus, Pittacus of Mitylene, Bias of Priéné, Cleobulus of Lindus, and most of the other wise men, as they are emphatically styled, who lived in that age, as well as Æsop the fabulist, and the elegant Greek poets of the times, were bountifully received at the court of Cræsus. Cyrus, king of Persia, defeated him, B. C. 548, and commanded him to be burnt alive. When on the pile, the unfortunate monarch thrice repeated the name of Solon, on which Cyrus had the curiosity to ask him

the meaning. He told the conqueror, that Solon had maintained that poverty was a happier state than riches, and that he found now his words were true. The words of a dying man make a strong impression on the heart. Those of Cæsar deeply affected the mind of Cyrus, who considered the speech of Solon as addressed to himself. He not only spared his life, but also gave orders that he should be seated by his side, and thenceforth treated as a king; a revolution of fortune equally sudden and unexpected. But the mind of Cæsar had undergone a still more important revolution: for, tutored in the useful school of adversity, he learned to think with patience and to act with prudence; to govern his own passions by the dictates of reason, and to repay by wholesome advice the generous behaviour of his Persian master; whom he survived.

CROIA, or **CROJA**, a town of European Turkey, in Albania, anciently the capital of the Albanian kings. It is seated near the Gulf of Venice.

CROISADE, **CRUSADE**, or **CRUZADO**, [from *croix*, a cross, Fr. or *crux*, a cross, Lat.] a name given to the expeditions of the Christians against the infidels, for the conquest of Palestine; so called because those who engaged in the undertaking wore a cross on their clothes, and bore one on their standard. This expedition was also called the holy war, to which people flocked in great numbers out of pure devotion, the pope's bulls and the preaching of the priests of those days making it a point of conscience. The several nations engaged in the holy war were distinguished by the different colours of their crosses: the English wore white, the French red, the Flemish green, the Germans black, and the Italians yellow. From this enterprise several orders of knighthood took their rise. They reckon seven croisades for the conquest of the Holy Land: the first begun in the year 1095, at the solicitation of the Greek Emperor and the Patriarch of Jerusalem. Though these croisades were effects of the most absurd superstition, they tended greatly to promote the good of Europe. Multitudes indeed were destroyed. It is computed in the different expeditions that upwards of two millions of people perished. Many there were, however, who returned; and these, having conversed so long with people who lived in a much more magnificent way than themselves, began to entertain some taste for a refined and polished way of life. Thus the barbarism, in which Europe had been so long immersed, began to wear off soon after. The princes also who remained at home, found means to avail themselves of the frenzy of the people. By the absence of such numbers of restless and martial adventurers, peace was established in their dominions. They also took the opportunity of annexing to their crowns many considerable fiefs, either by purchase, or the extinction of the heirs; and thus the mischiefs which must always attend feudal governments were considerably lessened. With regard to the bad success of the croisaders, it was scarce possible that any other thing could happen them. The emperors of Constantinople, instead of assisting, did all in their power to disconcert their schemes. They were jealous, and not without reason, of such an inundation of barbarians. Yet, had they considered their true interest, they would rather have assisted them, or at least done neuter, than entered into alliances with the Turks. They followed the latter method, however, and were often of very great disservice to the western adventurers, which at last occasioned the loss of their city. But the worst enemies the croisaders had were their own internal feuds and dissensions. They neither could agree while marching together in armies with a view to conquest, nor could they unite their conquests under one government after they had made them. They set up three small states, one at Jerusalem, another at Antioch, and another at Edessa. These states, instead of assisting, made war upon each other, and on the Greek emperors; and thus became an easy prey to the common enemy. The horrid cruelties they committed, too, must have inspired the Turks with the most invincible hatred against them, and made them resist with the greatest obstinacy. They were such as could have been committed only by barbarians inflamed with the most bigoted enthusiasm.

CROISES, or **CROIZES**: the knights of St. John of Jerusalem, instituted for the defence and protection of pilgrims, were particularly so called, from a cross they wore as a badge.

CROISHTARICH, a military signal among the ancient Caledonians, similar to the Crantara of the S. Britons.

CROISIERS, a religious order founded in honour of the dis-

covery of the cross by the empress Helena. They were, till of late, dispersed in several parts of Europe, particularly in the Netherlands, France and Bohemia. Those in Italy were suppressed even before the late revolutions. These religious follow the rule of St. Augustine. They had in England the name of Crouched Friars.

CROIX, Sr. a river which forms part of the boundary line between the United States and the British province of New Brunswick.

CROIX SUR MEUSE, a town of France in the department of Meuse, 12 miles S. S. E. of Verdun.

CROMAC WATER, a romantic lake of Cumberland between Buttermere and Lowes water.

CROMARTY, [from *Crom Ba Gael*, i. e. Crooked bay,] a county of Scotland, comprehending part of a peninsula bounded on the N. by the bay of Cromarty; on the E. and S. by the Moray Frith, and on the W. by Ross-shire.

CROMARTY, the capital of the county. Lon. 3. 53. W. Lat. 57. 44. N.

CROMER, a town of England, on the N. E. coast of Norfolk, chiefly inhabited by fishermen. It is 23 miles N. of Norwich.

CROMLECH, or **CROMLEH**, in British antiquity, huge, broad, flat stones, raised upon other stones set up on end. They are common in Anglesey. See Plate XLVII. fig. 17, 18. These monuments are described fully by Mr. Rowland, by Dr. Borlase, and by Wormius, under the name of *Aræ*, or altars. Mr. Rowland, however, is divided in his opinion; for he partly inclines to their having been altars, and partly to their having been sepulchres: he supposed them to have been originally tombs, but that in after times sacrifices were performed upon them to the heroes deposited within. Cromlech is by some derived from the Armorican word *crum*, crooked or bowing, and *leh*, stone, alluding to the reverence which persons paid to them by bowing. Rowland derives it from the Hebrew words *carem huach*, signifying a "devoted or consecrated stone." They are called by the Welsh, *coetne Arthor*, or Arthur's quoits, it being a custom in Wales, as well as Cornwall, to ascribe all great or wonderful objects to king Arthur, the hero of those countries.

CROMWELL, **OLIVER**, Lord Protector of the commonwealth of England, one of the most extraordinary personages mentioned in history, was the son of Mr. Robert Cromwell of Hinchinbrooke in the county of Huntingdon, by a lady of the name of Stuart; by some said to have been descended from the royal family. His paternal ancestors were of very honourable extraction: but no ways related to Thomas Cromwell earl of Essex. Their name was originally Williams, but afterwards changed to Cromwell. Oliver was born in the parish of St. John, Huntingdon, where his father mostly lived, on the 24th or 25th of April 1599, and educated at the free school of that town. It is related by authors of unsuspected veracity, that when at school he gave many signs of a very turbulent and restless disposition. At the age of 21, he married Elizabeth, daughter of Sir James Bouchier of Essex. He continued at Huntingdon, where he settled after his marriage, till an estate of between 400*l.* and 500*l.* per annum devolved to him by the death of his uncle Sir Thomas Stuart. This induced him to remove to the isle of Ely where the estate lay, and here he embraced the puritanical doctrines. He was elected a member of the 3d parliament of Charles I. which met on the 20th Jan. 1628; and was a member of the committee for religion, where he distinguished himself by his zeal against popery. After the dissolution of that parliament, he returned again into the country, where he continued to express much concern for religion, to keep company with silenced ministers, and to invite them often to lectures and sermons at his house. Thus he brought his affairs again into a very indifferent situation; so that, by way of repairing the breaches he had made in his fortune, he took a farm at St. Ives, which he kept five years. But this scheme succeeded so ill, that he gave it up; and at last, chagrined with his disappointments, and by the treatment his party at that time received, he formed a design of going over to New England. In this, however, he was disappointed; the king issued out a proclamation against all such emigrations. Afterwards he removed to Ely, where he acquired celebrity by his gifts in prayer and preaching. In 1640 he was returned to parliament for the borough of Cambridge by the par-

tan interest. In the house he was a frequent speaker, vulgar, and vehement, always opposing the court, and attacking the church. He was in a great measure the cause of the war, as he was continually by his plots and contrivances urging matters to that extremity. In 1642, when parliament determined upon hostilities, Cromwell went to Cambridge, where he raised his troop of horse, and behaved with great inhumanity to the loyal members of the university. He soon acquired the rank of colonel, and a great reputation for military skill and valour. His men were well-disciplined, and animated with a strong portion of religious fanaticism, which their commander encouraged in such a manner that they acquired at the battle of Marston Moor, in 1644, the name of Ironsides. At the second battle of Newbury, Cromwell's behaviour obtained for him from his party the title of Saviour of the Nation. This party consisted of the independents, who had gained so great an influence in parliament as to pass the famous self-denying ordinance, by which all members of either house were excluded from commands in the army, with the particular exception of Cromwell, who, by this master-piece of policy, acquired an ascendancy over the army, and thus paved the way for his future advancement. He was now constituted lieutenant-general, and by his management the battle of Naseby was gained in 1645, which decided the fate of the royalists. This victory was followed by a series of successes, for which he was voted a pension of 2500*l.* per annum, and the thanks of the house. When the king was betrayed by the Scotch to the parliament, Cromwell determined to get him into his own power. This he effected by means of cornet Joyce in 1647. The same year he purged the house of commons, that is, he turned out those members who were not likely to be gained over to his purpose. The share he had in the murder of the king is too plain to need detail. He was present at the trial, and signed the warrant of execution. Soon after this a mutiny broke out in the army, which threatened dangerous consequences; but Cromwell, by punishing the ringleaders, put an end to it. In 1649 he went to Ireland, which he subdued, and leaving Ireton as deputy, returned to England in 1650; but his cruelties are regarded with horror and detestation in that kingdom to this day. He was now appointed commander-in-chief against the Scots, who had armed to restore Charles II. September 3, 1650, he gained the battle of Dunbar; and that day twelvemonth he defeated the king at Worcester. From this time he kept his eye on the sovereign power. He began this favourite project by moulding the army to his will; and having a party subservient to his wishes, he struck a bold stroke by dismissing the parliament and locking the door of the house. He then dissolved the council of state; after which, he called a council, composed of his officers. He next convened a mock representation of the nation, consisting of 142 persons, called, from one of the members, Barebone's parliament. This assemblage being a motley crew of ignorant fanatics, and the creatures of Cromwell, agreed to resign their authority; on which the council of officers assembled, and drew up an instrument declaring him protector of the commonwealth of England, Scotland, and Ireland: accordingly, Dec. 16, 1654, he was invested with this dignity in the court of chancery. The following year he called a parliament but finding that the members began with questioning his authority, he placed a guard at their door, and then made each member as he entered take an oath of allegiance to him. This parliament still continuing refractory, he dissolved them after sitting five months. A war broke out between England and Spain in 1655, in which Jamaica was taken, and Blake gained several splendid victories, and caused the English flag to be respected in the Mediterranean. One consequence was an alliance between the protector and France, and the delivery of Dunkirk to England, after its being taken by the united forces of the two countries. In 1656 he called another parliament, which gratified the protector by confirming his title and sanctioning his proceedings. He wanted now the title of king, but this was rejected by his most zealous friends; and finding the object unattainable, he abandoned it. However, he had the privilege granted him to make a sort of lords; and the title of protector being recognized, he was inaugurated with the pomp of a coronation in Westminster-hall. In 1658 he convened the two houses, and addressed them in the language usual for the kings of England; but none of the hereditary nobles would attend his mock parliament. Finding that he could not form any thing like a regular

establishment, he dissolved the assembly. In August of that year his favourite daughter, Mrs. Claypole, died, bitterly reproaching him for his conduct, which, with the publication of a pamphlet, by colonel Titus, entitled *Killing no Murder*, tending to prove the assassination of the tyrant a public duty, produced a slow fever, of which he died September 3, 1658. A very pompous funeral was performed at the public expence, from Somerset-house, with a splendor even superior to that bestowed upon crowned heads. Some have related that his body was deposited in Naseby-field; others, that it was wrapped in lead, and sunk in the Thames, to prevent any insult that might afterwards be offered to it. But it seems beyond doubt that it was interred at Westminster; as we are informed, that on the order to disinter him after the restoration, his corpse was found in a vault in the middle aisle of Henry VII.'s chapel. In the inside of the coffin, and on the breast of the corpse, was laid a copper-plate finely gilt, inclosed in a thin case of lead. On one side of this plate were engraven the arms of England impaled with those of Oliver, and on the reverse the following legend: *Oliverius Protector Reipublicæ Angliæ, Scotiæ, et Hiberniæ, natus 29 Aprilis 1599, inauguratus 16 Decembris 1653, mortuus 3 Septembris ann. 1658, hic situs est.* Cromwell was of a robust frame of body, and of a manly, though not agreeable aspect. His nose being remarkably red and shining, was often made the subject of ridicule. He left only two sons, Richard and Henry; and three daughters; one married to General Fleetwood, another to Lord Fauconberg, and a third to Lord Rich.

CROMWELL, RICHARD, eldest son of Oliver, was by his father appointed successor to the protectorship, but was soon deposed by the army. They discharged his debts, took all the household stuff, plate, &c. gave him a protection for six months, and so he retired. He was not qualified to support the station gained by the aspiring talents of his father. He was of a moderate temper, and untainted with either the ambitious or fanatical spirit which his father had so successfully cultivated. The late Lord Gardenstone, in his Remarks on English Historians, says, "Had Richard possessed the abilities of his father, we should have heard no more of the posterity of the holy martyr." On the restoration he went abroad; but returned in 1680 under the assumed name of Clark, and settled at Cheshunt in Hertfordshire, where he lived privately, and died in 1712, aged 86; leaving several children, whose posterity are still in existence.

CROMWELL, THOMAS, Earl of Essex, was the son of a blacksmith, at Putney, and born in 1498. Without a liberal education, but endowed with a strong natural genius, he considered travelling as the proper means of improving his understanding; and to this early token of his sound judgement he stood indebted for the high rank and distinguished honours he afterwards enjoyed. He became by degrees the confidential favourite and prime minister of Henry VIII. and from the moment he acquired any authority in the cabinet, he employed it in promoting the reformation, to his zeal for which he became a victim; for, the more firmly to secure the Protestant cause, he contrived to marry the king to Ann of Cleves, whose friends were all Lutherans. Unfortunately Henry took a disgust to this lady, which brought on Cromwell's ruin; the king, with his usual cruelty and caprice, taking this opportunity to sacrifice this minister to the Roman Catholic party, to whom he seemed desirous of reconciling himself, as soon as he had Catherine Howard in view. Cromwell was a great politician, and a good man; but, like most statesmen, was guilty of great errors. In his zeal for the new religion, he had introduced the unjustifiable mode of attainder in cases of treason and heresy: and his enemies, who were numerous (consisting of two classes, the ancient nobility and gentry, who were enraged to see the highest honours bestowed on a man of his mean extraction, and the Roman Catholics, who detested him,) having preferred many complaints against him, availed themselves of his own law. He was attainted of treason, and heresy, convicted unheard, and beheaded in 1540. He was the chief instrument of the suppression of the abbeys and monasteries, and of the destruction of images and relics; to him also we are indebted for the institution of parish registers of births, marriages, and burials.

CRONACH, a fortified town of Germany, in the circle of Franconia, 25 miles N. E. of Bamberg.

CRONENBURG, a town of Germany, in the circle of the Upper Rhine, 10 miles N. of Frankfort.

CRONENBURG, or **CRONBORG**, a strong fortress of Denmark, in the isle of Zealand, at the entrance of the Sound, where the Danes take toll of such ships as are bound for the Baltic.

CRONIENES, feasts celebrated at Athens in the month Cronius, in honour of Saturn, answering to the Saturnalia of the Romans.

CRONIUS, or **CHRONIUS**, in chronology, the ancient name of the Athenian month Hecatombræon; which was the first of their year, and answered to the latter part of our June, and beginning of July.

CRÖNSNIERE, an island on the coast of France, about five miles in circumference.

CRONSTADT, a sea-port town of Russia, where the greatest part of the navy is situated. It stands upon the island of Retusarl in the Gulph of Finland.

CRONSTADT, or **KRONSTADT**, a town of Transylvania, near the frontiers of Moldavia, 60 miles E. N. E. of Hermanstadt.

CROSIER, or **CROZIER**, a shepherd's crook; a symbol of pastoral authority, consisting of a gold or silver staff crooked at the top, carried occasionally before bishops and abbots, and held in the hand when they give the solemn benedictions. The custom of bearing a pastoral staff before bishops is very ancient. Regular abbots are allowed to officiate with a mitre and crosier. Among the Greeks none but a patriarch had a right to the crosier.

CROSIER, in astronomy, four stars in the southern hemisphere in the form of a cross, serving those who sail in south latitudes to find the antarctic pole.

CROSLET, in heraldry, is when a cross is crossed again at a small distance from each of the ends. Upton says it is not so often borne by itself in arms as other crosses are, but often in diminutives, that is, in small croslets scattered about the field. See **HERALDRY**.

CROSS, [*crux*, Lat.] in antiquity, a species of punishment, or rather the instrument wherewith it was inflicted, consisting of wood placed crosswise, either crossing at right angles at the top like a T, or in the middle of their length like an X. The cross to which our Saviour was fastened, and on which he died, was of the former kind; being thus represented by old monuments, coins, and crosses; and St. Jerom compares it to a bird flying, a man swimming, or praying with his arms extended. The punishment of the cross was common among the Syrians, Egyptians, Persians, Africans, Greeks, Romans, and Jews. It was the most dreadful of all others, both for the shame and pain of it: and so scandalous, that it was inflicted as the last mark of detestation upon the vilest of people. It was the punishment of robbers and murderers, provided that they were slaves too; but if they were free, and had the privilege of the city of Rome, it was thought too infamous a punishment for such a one, let his crimes be what they would. The Mosaic law ordained, that the bodies of persons executed should not be left upon the tree after sun-set. Deut. xxi. 22. The Jews confess, that they crucified people in their country, but deny that they inflicted this punishment upon any one alive. They first put them to death, and then fastened them to the cross either by the hands or neck. But there are indisputable proofs of their crucifying men frequently alive. Before the crucifixion the criminal was generally scourged with cords; sometimes little bones, or pieces of bones, were tied to these scourges, that the condemned person might suffer more severely. It was also a custom, that he who was to be crucified should bear his own cross to the place of execution. In this manner Christ was compelled to bear his own cross; and as he sunk under the burden, Simon the Cyrenian was constrained to bear it after him and with him. But whereas it is generally supposed that our Lord bore the whole cross, *i. e.* the long and transverse part both, this seems to be a thing impossible; and therefore Lipsius (in his treatise "De Supplicio Crucis") has set the matter in a true light, when he tells us that Jesus only carried the transverse beam; because the long beam, or the body of the cross, was either fixed in the ground before, or made ready to be set up as soon as the prisoner came: and from hence he observes, that painters are very much mistaken in representing our Saviour carrying the whole cross. There are several ways of crucifying; sometimes the criminal was fastened with cords to a tree, sometimes he was crucified with his head downwards. This way St. Peter chose out of respect to his master Jesus Christ, not thinking himself worthy to be crucified like him; though the common way of crucifying was by fastening the criminal with nails, one

through each hand, and one through both feet, or one through each of them: for this was not always performed in the same manner. The ancients sometimes represent Jesus Christ crucified with four nails, and sometimes with three. The text of the Gospel shews clearly, that Jesus Christ was fastened to the cross with nails; and the Psalmist (xxii. 17,) had foretold long before, that they should pierce his hands and his feet: but there are great disputes concerning the number of these nails. The Greeks represent our Saviour as fastened to the cross with four nails; in which Gregory of Tours agrees with them, one at each hand and foot. But several are of opinion, that our Saviour's hands and feet were pierced with three nails only, *viz.* one at each hand, and one through both his feet: and the custom of the Latins is rather for this last opinion; for the generality of the old crucifixes made in the Latin church have only three nails.

CROSS, **EXALTATION OF THE**, an ancient feast, held on the 14th of September, in memory of this, that Heraclitus restored to Mount Calvary the true cross in 642, which had been carried off 14 years before by Cosroes king of Persia, upon his taking Jerusalem from the emperor Phocas.

CROSS, **INVENTION OF THE**, an ancient feast, solemnized on the 3d of May, in memory of the true cross of Christ being found by St. Helena, the mother of Constantine, deep in the ground on Mount Calvary; where she erected a church for the preservation of part of it: the rest being brought to Rome, and deposited in the church of the Holy Cross of Jerusalem.

CROSS, **ORDEAL OF THE**, a species of trial frequently practised in the days of superstition. See **ORDEAL**.

CROSS, **ORDER OF THE**, or **CROISADE**, an order of ladies instituted in 1668, by the empress Eleonora de Gonzagua, wife of the emperor Leopold I. on occasion of the miraculous recovery of a little golden cross, wherein were inclosed two pieces of the true cross, out of the ashes of part of the palace. The fire is said to have burnt the case wherein it was inclosed, and melted the crystal, yet the wood remained untouched!

Cross, in heraldry, is defined by Guillim, an ordinary composed of fourfold lines; whereof two are perpendicular, and the other two transverse; for so we must conceive of them, though they be not drawn throughout, but meet by couples, in four right angles, near the fess-point of the escutcheon. See **HERALDRY**. This bearing was first bestowed on such as had performed, or at least undertaken, some service for Christ, and the Christian profession; and is held by divers the most honourable charge in all heraldry. It came into frequent use from the ancient expeditions into the Holy Land; and the holy war pilgrims, after their pilgrimage, taking the cross for their cognizance; the ensign of that war being the cross. In those wars, says Mackenzy, the Scots carried St. Andrew's cross; the French a cross argent; the English a cross or; the Germans, sable; the Italians, azure; the Spaniards, gules. Leigh mentions 46 several crosses; Sylvanus Morgan, 26; Upton, 30; Johannes de Bado Aureo, 12.

CROSS, **ST. GEORGE'S**, or the red cross, in a field argent, is now the standard of England; of which that saint is the reputed patron.

Cross, in law, instead of a signature to a deed, &c. is derived from the Saxon practice of affixing the sign of the cross, whether they could write or not.

Cross, in mining, two nicks cut on the superficies of the earth, thus +, which the miners make when they take the ground to dig for ore. This cross gives the miners three days liberty to make and to set on stones. As many of these crosses, as the miner makes, so many mears of ground he may have in the vein, provided he set on stones within three days after making his cross or crosses. But if he make but one cross, and a by-stander makes the second, and a stranger makes the third, every one is served with the next mear, according as they have first or last, sooner or later, made their cross or crosses upon the ground.

CROSS-BAR SHOT, a round shot, or great bullet, with a bar of iron put through it.

CROSS-BAR SHOT, is used in sea-fights to destroy the enemy's rigging. The iron bar projects six or eight inches on each side.

CROSS-BEARER, [*port-croix*, *cruciger*,] in the Latin church, the chaplain of an archbishop or primate, who bears a cross before him on solemn occasions.

CROSS-

CROSS-BEARERS also denotes certain officers in the inquisition, who make a vow before the inquisitors or their vicars to defend the Catholic faith, though with the loss of fortune and life. Their business is to provide the inquisitors with necessaries.

CROSS-BILL, in chancery, is an original bill, by which the defendant prays relief against the plaintiff.

CROSS-BILL, in ornithology. See **LOXIA**.

CROSS-BOW. See **ARCHERY**, **BALLISTA**, and **BOW**.

CROSS-GRAINED STUFF, in joinery. Wood is said to be cross-grained, when a bough or branch has shot out of it; for the grain of the branch shooting forward, runs athwart that of the trunk. In wood well grown this defect is scarce perceivable, except in working; but in deal boards these boughs make knots.

CROSS-JACK, [pronounced *cro-ject*,] a sail extended on the lower yard of the mizen-mast, which is hence called cross-jack yard. This sail however, has generally been found of little service, and is therefore very seldom used.

CROSS-PIECE, a rail of timber extended over the windlass of a merchant-ship from the knightheads to the belfry.

CROSS-STAFF, [from *cross* and *staff*,] an instrument commonly called the forestaff, used by seamen to take the meridian altitude of the sun and stars.

CROSS-TINE, in husbandry, a method of harrowing land, consisting in drawing the harrow up the interval it went down before, and down that which it was drawn up.

CROSS-TREES, certain pieces of timber, supported by the cheeks and trestle-trees, at the upper ends of the lower masts, athwart which they are laid to sustain the frame of the top.

CROSS-TREE YARD is a yard standing square, just under the mizen-top, and to it the mizen-top is fastened below.

CROSSEN, a duchy of Germany, in the circle of Upper Saxony.

CROSSEN, the capital of the duchy, 21 miles S. E. of Frankfurt.

CROSSOSTYLIS, in botany, a genus of the monadelphia polyandria class and order. Calyx simple, four-parted; corolla four-petaled; nectary twenty, corpuscles between the filaments; stigmas four-jagged. There is but one species, viz. *C. biflora*, a native of the Society Islands.

CROSTOLO, a department of the late Cisalpine republic; which comprehended the duchy of Reggio.

CROTALARIA, **RATTLE-WORT**; a genus of the decandria order, and diadelphia class of plants; natural order, Papilionacæ. Legumen turgid, inflated, pedicellated; filaments coalited with a fissure on the back. There are thirty-two species, natives of warm climates.

CROTALO, an instrument in modern military music, resembling the ancient Crotalum. The Turks are the first, among the moderns, who introduced the use of it for their troops. It is now common in Florence, and other territories on the continent. It is the same with the ancient cymbalum.

CROTALUM, an ancient kind of musical instrument, found on medals, in the hands of the priests of Cybele. It differed from the sistrum, though authors frequently confound the two. It consisted of two little brass plates or rods, which were shaken in the hand, and in striking against each other made a noise.

CROTALUS, the **RATTLE-SNAKE**, in zoology, a genus of the class and order amphibia serpentes. Generic character: scuta on the abdomen; scuta and scales beneath the tail; rattle at the end of the tail. There are five species. The *C. horridus*, or banded rattle-snake, inhabits Carolina in North America, and is from three to five feet in length, of a yellowish brown colour. The rattle is fixed at the end of the tail, and is composed of dry and hollow bones, nearly of the same form and size. See Plate LXVII. It is of a brown colour, composed of several horny, membranous cells, of an undulated pyramidal figure. These are articulated within one another in such a manner that the point of the first cell reaches as far as the basis of the protuberant ring of the third, and so on; which articulation, being very loose, gives liberty to the parts of the cells that are inclosed within the outward rings to strike against the sides of them, and so to cause the rattling noise which is heard when the snake shakes its tail. This is the most inactive and slow moving of all the snakes, and is never the aggressor except in what it preys upon. The use of the rattle has not a little perplexed naturalists, and some have considered it de-

signed to warn other animals of their danger, while others have regarded it as intended, indeed, to sound the alarm of peril, but such an alarm as is followed by consternation, under which the affrighted victims experience a prostration of all its faculties, and is bereaved at once of intelligence and motion. These animals were supposed to possess the power of charming others, or of operating upon them by some ineffable power, to induce them to drop from their stations into the very mouth of the destroyer. This opinion, long prevailing, but now exploded, not unnaturally arose from the circumstance just mentioned. The appearance of the rattle-snake to these creatures, who instantly recognize it for their mortal enemy, and the sound of that instrument, which is as it were the signal of execution, impresses them occasionally with a degree of terror, which withers all the energies of their frame, and relaxing their hold on the branches of trees, causes them to drop almost lifeless into the mouth of their adversary. The bite of these animals is not only poisonous, but rapidly fatal, and has been known to kill a man in two minutes. When the bite is received in a fleshy part, the Indians apply the knife with all possible speed. In slight cases they have recourse to various roots; and in some cases they suck the wound; but when a principal vein or artery is penetrated, with the animal's full strength, they abandon their case as hopeless, and apply no remedy whatever. In the territories of America, but thinly inhabited, rattle-snakes are abundant; but in others they are almost exterminated. They are seldom seen farther north than Lake Champlain, or south than Brazil. They are extremely fond of frogs, and are found generally where these are most to be met with. In summer they are generally seen in pairs; in winter they are gregarious, and secure themselves from the rigours of the season by withdrawing deeply in the earth, whence a fine day sometimes induces them to appear, but in a state of great weakness, in which they may be attacked without danger, and in which a single person has sometimes destroyed with a stick several scores in a single morning. The largest ever seen by Catesby, who, while in Carolina, paid particular attention to them, was about eight feet long, and nearly nine pounds in weight.

CROTCHES, in ship-building, very crooked timbers in the hold or bread-room, from the mizen-step aft, fayed cross the keelson, to strengthen the ship in the wake of the half-timbers.

CROTCHET, in music, one of the notes or characters of time, which is equal to half a minim, and double of a quaver.

CROTCHET, in printing, a sort of straight or curved line, always turned up at each extreme; serving to link such articles as are to be read together; and used in analytical tables, &c. for facilitating the divisions and subdivisions of any subject.

CROTCHETS are also marks or characters, serving to inclose a word or sentence, which is distinguished from the rest, being generally in this form [] or this ().

CROTO, or **CROTON**, in ancient geography, a city of the Brutii, in Italy, built by the Achæans; 150 stadia to the N. of Lacinium, and in the neighbourhood of Metapontum.

CROTON, in botany, **WILD RICINUS**: a genus of the monadelphia order, and monœcia class of plants; natural order, Tri-côcæ. Male calyx cylindrical, quinque-dentated; corolla pentapetalous; stamina from ten to fifteen; female calyx polyphylous; no corolla; three bifid styles; capsule trilocular; seed one. There are fifty-three species, mostly herbaceous and shrubby plants.

CROTONA, an ancient city of Naples, in the province of Calabria Ultra, originally built by the Greeks. It is seated upon the mouth of the Essaro, 50 miles E. of Cosenza.

CROTOPHAGI, in ornithology, a genus of birds of the order pica. Bill thin, compressed, greatly arched, half oval, and cultrated at top; nostrils round; tongue flat, pointed at the end; tail consists of ten feathers; toes placed two and two. Four species are known.

C. ANI is about the size of a blackbird: the colour is black, in some parts glossed with purple, and about the neck faintly tinged with green on the margins: the base of the bill is furnished with black bristles, which turn forwards: the eyelids have long hairs like eye-lashes: the tail is six inches long, and much cuneated; and the legs are black. This species is found in Jamaica, St. Domingo, and other islands in the West Indies; also at Cayenne and

and other parts of South America. Contrary to all other birds, they have the singularity of many laying in the same nest; to make which, they all unite in concert, and after laying their eggs, sit on them close to each other in order to hatch them, each unanimously striving to do the best for the general good; and when the young are hatched, the parents, without reserve, do the best to feed the whole flock. Still a greater singularity occurs, which is, that as soon as each female lays her eggs she covers them with leaves, doing the same thing whenever she is obliged to leave the nest for food: this might be necessary in a cold climate; but why it should be wanted in a hot one seems not clear, especially as it has not been observed in other birds.

CROTOY, a town of France, in the department of Somme, 16 miles N. W. of Abbeville.

CROUP, or **CYNANCHE TRACHEALIS**, a disease of the trachea, to which children are liable. See **MEDICINE**.

CROUPADES, higher leaps than those of corvets, that keep the fore and hind quarters of the horse in an equal height, so that he trusses his legs under his belly without jerking.

CROUSAZ, **JOHN PETER DE**, a learned philosopher and mathematician, born in 1663. Having made great progress in the mathematics and the philosophy of Des Cartes, he travelled to Geneva, Holland, and France; was successively professor in several universities; and at length was chosen governor to Prince Frederic of Hesse-Cassel, nephew to the King of Sweden. He wrote many works; the most esteemed of which are, 1. His *Logic*, in 6 vols. 8vo. in 1741. 2. *A Treatise on Beauty*. 3. *A Treatise on the Education of Children*, 2 vols. 12mo. 4. *Several Treatises on Philosophical and Mathematical Subjects*, &c. He died at Lausanne, in 1748.

CROUTE, **SOUR CROUTE**, or **KROUTE**, [*Sauer kraut*, Germ. *z. a.* sour herb,] a preparation of cabbage, which has been found of sovereign efficacy as a preservative from the sea scurvy in long voyages. The process for making it is as follows: the soundest and most solid cabbages are selected for this use, and cut very small, commonly with an instrument made for this purpose, resembling the plain for slicing cucumbers. A knife is used when the preparation is made with greater nicety. The cabbage thus minced is put into a barrel in layers, hand high, and over each is strewed a handful of salt and caraway seeds; in this manner it is rammed down with a rammer, stratum super stratum, till the barrel is full; when a cover is put over it, and pressed down with a heavy weight. After standing some time in this state, it begins to ferment; and it is not till the fermentation has entirely subsided, that the head is fitted to it, and the barrel is finally shut up and preserved for use. There is not a drop of vinegar employed in this preparation.

CROW, in ornithology. See **CORVUS**.

CROWD SAIL, in the sea language, is to carry an extraordinary force of sail upon a ship, in order to accelerate her course on some important occasion; as in pursuit of, or flight from, an enemy; to escape any immediate danger, &c.

CROWEA, in botany, a genus of the class decandria, order monogynia. Calyx five-parted; petals five, sessile; stamina flat, subulate; capsules five, united; seeds coated. One species, native of Australasia.

CROWFOOT. See **RANUNCULUS**.

CROWFOOT, on ship-board, a complication of small cords spreading out from a long block, like the smaller parts which extend from the back-bone of a herring. It is used to suspend the ownings; or to keep the top-sails from striking violently, and fretting against the tops. See Plate XLVII. fig. 19.

CROWLAND, a town in Lincolnshire, seated in the fens, in a dirty soil, 12 miles N. N. E. of Peterborough.

CROWLE, a town in Lincolnshire, in the isle of Axholm, 36 miles N. of Lincoln.

CROWN, [*courome*, Fr. *kroone*, Dut. *corona*, Lat.] an ornament worn on the head by kings, sovereign princes, and noblemen, as a mark of their dignity.

CROWN, is also used to signify the possessions and dignity of a king. The crown of England, according to Sir William Blackstone, is, by common law and constitutional custom, hereditary; and this in a manner peculiar to itself: but the right of inheritance may from time to time be changed or limited by act of parliament, under which limitations the crown still continues hereditary. See **SUCCESSION**.

CROWN OFFICE, an office belonging to the court of King's Bench, of which the king's coroner or attorney is commonly master. In this office, the attorney-general and clerk of the crown severally exhibit informations for crimes and misdemeanors at common law, as in the case of batteries, conspiracies, libelling, &c. on which the offender is liable to pay a fine to the king.

CROWN, PLEAS OF THE. See **ARRAIGNMENT**, and **PLEA**.

CROWN, in commerce, is a general name for coins, both foreign and domestic, of or near the value of five shillings sterling. In its limited sense, crown is only applicable to the British coin of that name, which is worth five shillings and equivalent to six livres French money: but, in its extensive sense, it takes in several others; as the French *écu*, which we call the French crown, struck in 1641 for sixty sols, or three livres; also the patagon, dollar, ducatoon, rixdollar, and piece of eight.

CROWN, in an ecclesiastical sense, is used for the clerical tonsure; the mark of the Romish ecclesiastics. This is a little circle of hair shaved off from the crown of the head; more or less broad, according to the quality of the orders received.

CROWN, in jewellery work, the upper work of the rose diamond, which all centres in the point at the top, and is bounded by the horizontal ribs.

CROWNS, ANCIENT. The first crowns were no more than a bandelet drawn round the head, and tied behind, as we still see it represented on medals round the heads of Jupiter, the Ptolemies, and kings of Syria. Afterwards they consisted of two bandelets; by degrees they took branches of trees of divers kinds; at length they added flowers, insomuch that Claudius Saturninus says, there was not any plant whereof crowns had not been made.

CROWNS, ANCIENT JEWISH. In scripture there is frequent mention of crowns, and the use of them seems to have been very common among the Hebrews. The high priest wore a crown, which was a fillet of gold placed upon the forehead, and tied with a ribbon of hyacinth colour, or azure blue. It seems that private priests, and even common Israelites, wore also a sort of crowns, since God commanded Ezekiel not to take off his crown, nor assume the marks of one in mourning. This crown was only a ribbon or fillet, with which the Jews and several people in the east girt their heads.

CROWNS, ANCIENT ROMAN. The Roman emperors had four kinds of crowns, still seen on medals, viz. a crown of laurel, a radial or radiating crown, a crown adorned with pearls and precious stones, and the fourth a kind of bonnet or cap, something like the mortar. The Romans had also various kinds of crowns, which they distributed as rewards of merit; which were considered as marks of nobility to the wearers; and upon competitions with rivals for rank and dignities, often determined the preference in their favour: such as,

1. **CROWNS, ATHLETIC**, those generally bestowed upon victors at the public games.

2. **CROWNS, CAMP**, or **TRENCH**, [*corona castrenses*, or *vol-lares*,] were circles of gold, raised with jewels or palisades; the rewards of those who first forced the enemy's entrenchments. See Plate XLVII. fig. 20.

3. **CROWNS, CIVIC**, were made of branches of green oak, and given to such as had saved the life of a citizen. See fig. 21.

4. **CROWNS, GOLDEN**, [*corona aurea*,] without any distinguishing term or form, are mentioned as often bestowed upon the soldiers for extraordinary acts of bravery.

5. **CROWNS, LAUREL**, were peculiarly appropriated, though not exclusively, to eminent poets, orators, &c.

6. **CROWNS, MURAL**, were in the form of a circle of gold, indented and embattled. See Fig. 22. They were given to such as first mounted the wall of a besieged place, and there lodged a standard.

7. **CROWNS, NAVAL**, or **ROSTRAL**, were composed of a circle of gold, with ornaments representing beaks of ships, and given to the captain who first grappled, or the soldiers who first boarded, an enemy's ship. See Fig. 23.

8. **CROWNS, OBSIDIONAL**, or **GRAMINEOUS**, [*obsidionales*, or *gramineae*,] were made of grass growing on the place, where a general had delivered a Roman army from a siege, in the form represented in fig. 24, and presented to him as a mark of honour.

9. **CROWNS, OVAL**, were made of myrtle, and presented to generals, entitled to the ovation, or less triumph, fig. 25.

10. **CROWNS, RADIAL**, were bestowed on emperors, upon their deification, fig. 26.

11. **CROWNS, TRIUMPHAL**, consisted at first of wreaths of laurel, but were afterwards made of gold, and given to such generals as had the honour of a triumph, fig. 27.

CROWNS, MODERN. See **HERALDRY**.

CROWN, in geometry, is a plane ring included between two concentric perimeters, and is generated by the motion of some part of a right line round the centre, the said moving part not being contiguous to the centre. The area of a crown will be had by multiplying its breadth by the length of the middle periphery; for

$$a + w$$

a series of terms in arithmetic progression being $n \times \frac{a + w}{2}$, that

is, the sum of the first and last multiplied by half the number of terms, the middle terms must be $\frac{a + w}{2}$; therefore that multiplied

by the breadth, or sum of all the two terms, will give the crown.

CROWN OF COLOURS, certain coloured rings, which, like halos, appear about the body of the sun or moon, but of the colours of the rainbow, and at a less distance than the common halos. These crowns sir Isaac Newton has shewn to be made by the sun's shining in a fair day, or the moon in a clear night, through a thin cloud of globules of water, or hail all the same bigness. And according as the globules are greater or less, the diameters of these crowns will be larger or smaller; and the more equal these globules are to one another, the more crowns of colours will appear, and the colours will be the more lively.

CROWN-GLASS. See **GLASS**.

CROWN IMPERIAL. See **FRITILLARIA**.

CROWN ISLAND, an island in the eastern sea, near the N. E. coast of New Guinea. Lon. 146. 50. E. Lat. 5. 18. S.

CROWN-POINT, a township of New York, in Clinton county.

CROWN-WHEEL OF A WATCH, the upper wheel next the balance, which by its motion drives the balance, and in royal pendulums is called the swing-wheel.

CROWN-WORK, in fortification, an outwork having a very large gorge, generally the length of the curtain of the place, and two long sides terminating towards the fields in two demi-bastions, each joined by a particular curtain to a whole bastion, which is the head of the work. The crown-work is intended to inclose a rising ground, or to cover the head of a retrenchment. See **FORTIFICATION**.

CROW-NET, an invention for catching wild fowl in winter, which may be used in the day-time. It is made of fine pack-thread; the meshes should be two inches wide, the length about ten yards, and the depth three; it must be verged on the side with good strong cord, and stretched out very stiff on long poles prepared for that purpose. At the proper place, open it, and lay it out at its full length and breadth; then fasten the lower end of it all along the ground, so as only to move it up and down; the upper end of the net must stand extended on the long cord; the further end thereof being staked first to the earth by a strong cord about five yards from the net. Place this cord in an even line with the lower edge of the net. The other end must be at least 25 yards distant to reach into some natural or artificial shelter, where one may lie concealed from the fowl, otherwise no success can be expected. The net must be placed in such exact order that it may give way to play on the fowl on the least pull of the cord, which must be done smartly, lest the fowl should escape. This net may be used for pigeons, crows, or other birds, on corn-fields newly sown; also in stubble-fields; provided the stubble conceals the net from the birds.

CROWNING, in architecture, is understood, in the general, of any thing that terminates or finishes a member or decoration. Thus, a cornice, a pediment, &c. are called crownings, the abacus is said to crown the capital; and any moulding is said to be crowned when it has a fillet over it; and a niche is crowned when it is covered with a capital.

CROWNING, in sea language, denotes the finishing part of a knot made at the end of a rope. It is performed by interweaving the ends of the different strands artfully amongst each other, so as they may not become loosened or untwisted. They are useful in all kinds of stoppers.

CROW'S-BILL, among surgeons, a kind of forceps for drawing bullets and other foreign bodies out of wounds.

CROWTH, or **CRUTH**, a kind of musical instrument anciently in use among the common people in Wales. It is of the fiducial kind, somewhat resembling a violin, 12 inches in length, and an inch and an half in thickness. See **PLATE XXVII**.

CROYDON, a town of England, in Surrey, near the head of the river Wandel.

CRUANACARRA, a small island in the Atlantic, on the W. coast of Ireland.

CRUANAKILLY, an island on the W. coast of Ireland.

CRUCIANELLA, **PETTY-MADDER**, a genus of the monogynia order, and tetrandria class of plants; natural order, *Stellatae*. Corolla monopetalous, funnel-shaped; calyx diphyllous; seeds two, linear. Nine species, herbaceous plants, natives of warm climates.

CRUCIBLE, a chemical vessel made of earth, and so tempered and baked as to endure the greatest fire. They are used to melt metals, and to flux minerals, ores, &c. See **CHEMISTRY**.

CRUCIFORM, in botany, a term applied to cross-shaped flowers, or flowers consisting of four petals, which spread at the top in form of a cross. Of this kind is the stock-gillyflower, &c.

CRUCITA, in botany, a genus of the digynia order, and tetrandria class of plants. Interior calyx tetraphyllous, exterior calyx triphyllous; no corolla; seed one.

CRUDEN, ALEXANDER, M. A. an author, whose literary labours will ever entitle him to the gratitude of all who wish to study the scriptures, was the son of Mr. William Cruden, merchant, and one of the magistrates of Aberdeen. He was born in 1701, and educated at the grammar-school of that city. He studied divinity at the Marischal College, and intended to follow that profession; had he not been prevented by a misfortune, to which kings and beggars have been equally subjected, and to which men of uncommon genius are perhaps peculiarly liable, if we may credit the poet; that

"Great wit to madness oft is near allied,

"And thin partitions do the bounds divide."

The cause of his insanity has been variously accounted for; but the most probable reason assigned, appears to have been disappointment in love; wherein, to the vexation of repeated refusals, was added the horror of hearing, that the object of his affection was with child to her own brother. Being a clergyman's daughter, she was sent out of the country, and never returned. Mr. Cruden never after mentioned her name, but with the most tender compassion and the bitterest grief. He was confined for some time after in a mad-house at Aberdeen. Being released, he went to London in 1722, as a private tutor; in which employment he also spent some years in the Isle of Man. About 1732, he returned to London, and acted as a bookseller, and corrector of the press. His shop was under the royal exchange. In 1733, he began to compile that important work, which he had long meditated, "A Complete Concordance of the Holy Scriptures of the Old and New Testaments." If the merit of labour only be allowed, it must be acknowledged that he bestowed labour to which no addition can be made, accompanied by a perseverance with hardly any interval. But he had the additional merit of both forming the plan and executing it. The work was dedicated to Q. Caroline, who had given him reason to expect a gratuity on presenting it. But a few days before its publication, Cruden lost his royal patroness by the queen's death. His affairs were now embarrassed; his hopes were gone, and in such circumstances it is not surprising, that he should have had a return of his mental disorder; which rendered it necessary again to confine him. Upon his release, he avenged himself on his keepers, &c. by publishing a pamphlet entitled, "The London Citizen, exceedingly injured, giving an account of his adventures, during his severe and long campaign at Bethnal Green, for nine weeks and six days," &c. After this he lived chiefly by correcting the press; particularly of the Greek and Roman classics, which were published under his inspection, with great accuracy. In such occupations he spent several years with the strictest attention and fidelity to the booksellers who employed him, till a third attack of his disorder obliged his friends to confine him once more. When released, he published his case, under the whimsical title of "The Adventures of Alexander the Corrector." This work exhibited a faithful picture of a wild mind; various, whimsical, serious, and jocose. In private life he was courteous and affable; in religious sentiments a strict Calvinist, but by no means intolerant. In 1769, he re-visited Aberdeen, where

where he spent about a year; after which he returned to London; and on the 1st of Nov. 1770, was found dead on his knees in a posture of praying. He had for some time before been troubled with an asthma.

CRUDIA, in botany, a genus of the decandria monogynia class and order. Calyx one-leaved, with a two-cleft border; no corolla; filaments dilated at the base; capsule orbicular; about two-seeded. Two species, viz. the spicata and aromatica, found in Guiana.

CRUISE, [from the Ger. *kruiss*, across,] signifies to cross to and fro, to sail up and down within a certain space of the sea, called the cruising latitude, in quest of vessels, or fleets of an enemy, &c.

CRUISERS, in the navy, are small men of war used in the channel, and elsewhere, to secure our merchant-ships and vessels from the enemy's small frigates and privateers. They are generally such as sail well, and are commonly well manned: and indeed the safety of the trade in the channel, and up and down the soundings, and other places, requires the constant keeping out of such ships at sea.

CRUIT, an island in the Atlantic, on the N. W. coast of Ireland.

CRUMENTATA, among zoologists, animals furnished with a pouch or bag, wherein to receive their young in time of danger; as the opossum.

CRUMP, an island, N. E. of Antigua, about one mile long. Lon. 61. 25. W. Lat. 17. 14. N.

CRUOR, sometimes signifies the blood in general; sometimes only the venous blood; and sometimes extravasated or coagulated blood; but is most frequently used for the red globules of the blood, in contradistinction to the limpid or serous part.

CRUPPER, [from *croupe*, Fr. the buttocks of the horse,] in the manege, the buttocks of a horse, the rump; also a thong of leather put under a horse's tail, and drawn up by thongs to the buckle behind the saddle, so as to keep him from casting the saddle forwards on his neck.

CRUREUS, or **CRUREUS MUSCULUS**, in anatomy, a fleshy mass, covering almost all the fore-side of the os femoris, between the two vasti, which likewise cover the edges of this muscle on each side. See **ANATOMY**.

CRURAL, in anatomy, an epithet given to the artery which conveys the blood to the crura or legs, and to the vein by which this blood returns to the heart. See **ANATOMY**.

CRUS, in anatomy, all that part of the body contained between the buttocks and the toes.

CRUSADO, in commerce, a Portuguese coin, struck under Alphonsus V. about A.D. 1457, when pope Calixtus sent thither the bull for a croisade against the infidels. This coin has a cross on one side, and the arms of Portugal on the other.

CRUSCA, [Ital. i. e. *bran*,] the title assumed by a celebrated academy established at Florence for purifying and perfecting the Tuscan language. See **ACADEMY**. The academy took its name from its office and object; which were to refine the language, and as it were to separate the bran from it. Accordingly, its device is a sieve; and its motto, *Il più bel fior ne coglie*; that is, "It gathers the finest flour thereof." In the hall where the Academy meets, M. Moneonis informs us, that every thing bears an allusion to the name and device: the seats are in form of a baker's basket; their backs like a shovel; the cushions of grey satin, in form of sacks; and the branches where the lights are placed resembling sacks. The vocabulary Della Crusca is an excellent Italian dictionary, composed by this academy.

CRUSTACEOUS FISH, in natural history, are those covered with shells consisting of several pieces or scales; as those of crabs, lobsters, &c. These are usually softer than the shells of the testaceous kind, which consist of a single piece, and generally are thicker and stronger than the former; such as those of the oyster, scallop, cockle, &c. Dr. Woodward observes, in his Natural History, that of all the shells found in beds, and of all the different matters dug out of the earth, there are scarcely any of the crustaceous kind: the reason he gives for it is, that these being much lighter than the rest, must have floated on the surface at the time of the deluge, when all the strata were formed, and there have corrupted and perished.

CRUSTS, in chemistry, those bony coverings of which the whole external surface of crabs, lobsters, and other sea-ani-

mals of a similar kind are composed. These consist of, 1. Cartilaginous substance, possessing the properties of coagulated albumen. 2. Carbonate of lime. 3. Phosphate of lime. By the presence of the phosphate of lime, they are distinguished from bones. Thus the crusts lie as an intermediate substance between bones and shells, partaking of the properties and constitution of each. The shells of the eggs of fowls must be referred likewise to the class of crusts, since they contain both phosphate and carbonate of lime; the animal cement in them, however, is much smaller in quantity. From the experiments of Bernard and Hatchett, it is extremely probable that the shells of snails are composed likewise of the same ingredients, phosphate of lime having been detected in them by these chemists. Mr. Hatchett examined the crust of crabs, lobsters, prawns, and crayfish. When immersed in diluted nitric acid, these crusts effervesced a little, and gradually assumed the form of a yellowish-white soft elastic cartilage, retaining the form of the crust. The solution yielded a precipitate to acetate of lead, and ammonia threw down phosphate of lime. Carbonate of ammonia threw down a much more copious precipitate of carbonate of lime. On examining the crust which covers different species of echini, Mr. Hatchett found it correspond with the other crusts in its composition.

CRUX, or **St. CROIX**, one of the Caribbee islands, situated about 60 miles S. E. of Porto-Rico. Lon. 64. 0. W. Lat. 17. 30. N. **CRUXHAVEN**, a sea-port town of Germany, on the N. coast of the duchy of Bremen.

CRYMODES, among the physicians, a kind of fever attended with a shivering cold, and inflammation of the internal parts of the body.

CRYPISIS, in botany, a genus of the diandria digynia class and order: natural order Grasses. Calyx glume two-valved, one-flowered; corolla glume two-valved, awnless. One species, viz. *C. aculeata*, prickly crypsis, a native of the south of Europe and Siberia.

CRYPTA, [from *κρυπτω*, to hide,] a subterraneous cell or vault, especially under a church, for the internment of particular families or persons.

CRYPTO-CALVINISTS, a name given to the favourers of Calvinism in Saxony, on account of their secret attachment to the Genevan doctrine and discipline.

CRYPTOCEPHALUS, in natural history, a genus of insects of the order coleoptera. Characterised by filiform antennæ; four feelers; thorax margined; shells immarginate; body somewhat cylindrical. This is a very extensive genus, having nearly 300 species. They are divided into two sections, A. feelers equal, filiform; B. feelers unequal; fore-ones hatchet-shaped. See Plate XXXVII.

CRYPTOGAMIA, [from *κρυπτε*, concealed, and *γάμος*, nuptials,] the twenty-fourth class in the Linnean system, comprehending those plants whose fructification is concealed, either through minuteness, or within the fruit. See **BOTANY**.

CRYPTOGRAPHY, [*κρυπτε* and *γραφω*,] 1. The act of writing secret characters. 2. Secret characters; cyphers. Also the art of writing with sympathetic ink. See **CYPHER** and **INK**.

CRYPTOLOGY, [*κρυπτε* and *λογω*,] enigmatical language.

CRYPTOPORTICUS, [*κρυπτε*, Gr. and *porticus*, Lat.] a subterraneous place, arched or vaulted; used as an underwork or passage in old walls.

CRYPTOSTOMUM, in botany, a genus of the pentandria monogynia class and order. Calyx ventricose, five-cleft; tube of the corolla inserted into the throat of the calyx; border five-cleft; nectary five-toothed; berry; seeds scarred. One species, viz. *C. Guianense*, Guiana cryptostomum.

CRYSTAL, [*κρυσταλλος*,] in natural history, the name of a very large class of fossils; hard, pellucid, and naturally colourless. The forms or orders of pure crystal are three: I. *Perfect columnar crystals*, with double pyramids, composed of 18 planes, in an hexangular column, terminated by an hexangular pyramid at each end. II. *Perfect crystals with double pyramids*, without a column, composed either of 12 or 16 planes, in two hexangular pyramids joined closely base to base, without the intervention of any column. III. *Imperfect crystals*, with single pyramids, composed either of 12 or 10 planes, in an hexangular or pentangular column, affixed irregularly at one end to some solid body, and terminated at the other by an hexangular or pentangular pyramid. These are all the general forms into which crystal, when pure, is found concreted;

concreted: but under these there are almost infinite varieties in the number of angles, and the length, thickness, and other accidents of the columns of the pyramids. IV. When crystal is blended with metalline particles at the time of its formation, it assumes a variety of figures wholly different from these, constituting a fourth order, under the name of metalline crystals: when the metal is lead, the crystal assumes the form of a cube; when it is tin, of a quadrilateral pyramid, with a broad base; when iron, the crystal is found concreted in rhomboidal figures: these crystals are very common about mines; but the common spars, which are liable to be influenced in the same manner by the metals, and to appear in the very same form, are to be carefully distinguished from them. There is one very easy test, viz. that all spars are subject to be dissolved by aquafortis, and effervesce violently only on its touching them: but it has no such effects on crystal. V. When crystals are found in the form of round pebbles, which is occasioned by their being tossed about and rubbed against one another by floods or by the sea, they are called by the English lapidaries pebble crystal. They come from the Indies, Siberia, and other places. VI. The pebble crystal is common in all parts of the world; but that which is formed of hexangular columns, affixed to a solid base at one end, and terminated by an hexangular column at the other, is infinitely more so: this is called sprig or rock crystal, and is the species described by most authors under the name of crystal of the shops, or that kept for medicinal uses. When the rock crystals are semitransparent, or intermixed with opaque veins, they are called by the Swedish lapidaries milk crystals. According to Bomare, they are generally formed upon or among quartz, which shews their great affinity, and are to be found in almost all parts of the world. The greatest quantity of them is brought from Mount Saint Gothard, in Switzerland. Large pieces of these weighing from 5 to 800 pounds, were found there, at Grinfelberg.

CRYSTALLINE HEAVENS, in ancient astronomy, two spheres, imagined between the primum mobile and the firmament, in the Ptolemaic system, which supposes the heavens solid, and susceptible of only a single motion. See **ASTRONOMY**.

CRYSTALLINE HUMOUR, in anatomy, a thick, compact humour, in form of a flattish convex lens, situated in the middle of the eye, serving to make that refraction of the rays of light, necessary to make them meet in the retina, and form an image thereon, whereby vision may be performed. See **ANATOMY** and **EYE**.

CRYSTALLIZATION. This word originally signified ice; but it was afterwards applied by the ancients to crystallized silica, or rock crystal; because, as Pliny informs us, they considered that body as nothing else than water congealed by the action of cold. Chemists afterwards applied the word to all transparent bodies of a regular shape; and at present it is employed to denote in general the regular figures which bodies assume when their particles have full liberty to combine according to the laws of cohesion. These regular bodies occur very frequently in the mineral kingdom, and have long attracted attention on account of their great beauty and regularity. The process by which these crystals are formed, is called crystallization. It takes place when the attraction of aggregation has been weakened, either by the application of heat, or of a chemical affinity, and is suffered to resume its force more slowly or equally. In this case, the particles are not united indiscriminately, but in uniting assume a particular arrangement; and thus form masses of regular figures, bounded by plain surfaces and determinate angles. Crystallization is of two kinds: first, as it takes place from the reduction of temperature in a body which has had fluidity communicated to it by the operation of heat; and, secondly, as it proceeds from the diminution of the solvent power of a fluid, which has communicated fluidity to a solid by having combined with it. Of the first kind of crystallization, water affords an example in passing into ice by a reduction of its temperature. At first long and slender spiculae form in the fluid, and from these others shoot out at a certain angle, and this continues till the interstices are filled with the crystals, and the whole becomes a solid transparent crystallized mass of ice. Also the metals, when melted and cooled slowly, assume symmetrical forms. Some inflammables, as sulphur, crystallize in a similar way. Of the second kind of crystallization, the principal examples are derived from the order of salts, and a few other solids, soluble in water. The solution of a solid in a fluid, is in almost every case increased by heat, which weakens cohesion: hence a larger quantity of the

solid is kept in solution at a high, than a low temperature. If, therefore, we prepare a solution of salt in hot water, the solution being saturated, or the fluid having dissolved as much of the salt as it can do, on allowing it to cool, the portion of the salt which the heat enabled the fluid to dissolve, will separate; and unless the cooling of the solution has been very rapid, the particles of the solid, in approaching to each other, will pass into those regular arrangements which constitute crystals. The same thing is effected by the evaporation of the fluid in which a solid body is dissolved. If the evaporation be spontaneous, the crystals will be frequently more regular, and of a larger size than those obtained by cooling or reducing the temperature, since, in this case, the particles are more at liberty to obey the laws of attraction, which unites them in regular forms. In general, it is found, that the slower the process of crystallization, the more perfect is the crystal in its arrangement; it is also larger, harder, and more transparent: whereas, when the process is too rapid, or is disturbed by agitation, or other causes, the arrangement is less regular, and the form incomplete. Hence the crystals formed by nature are so much more perfect than those produced by artificial processes. Another method of crystallizing salts, is, by adding to a solution of salt a substance which does not act upon the latter, but which has a greater affinity with the water, and will serve to deprive the salt of a portion of that liquid which holds it in a state of solution. Alcohol will effect this purpose in many salts; and, if judiciously added, will cause them to separate freely from the menstruum, or fluid, and form large and beautiful crystals. From a variety of experiments, it has been observed that crystallization may be remarkably promoted, by throwing into the vessel a few small crystals of the same nature. And on this Le Blanc has founded a method of obtaining large and perfect crystals. It consists in selecting very regular crystals of a salt that have been newly formed, and putting them into a saturated solution of the same salt. They increase in size; and as the side which is in contact with the vessel receives no increase, they are to be turned daily to preserve their regularity. After some time, the largest and most regular of these crystals are to be selected, and the same process repeated on them; and thus crystals much larger and more regular than are usually formed in a solution may be obtained. The access of the air has an important influence on this process. If a saturated solution of salt when hot, be put into a vessel from which the air is excluded, it does not crystallize even when cold. But if the air be admitted, the crystallization immediately commences and proceeds with rapidity. It has been shewn by Dr. Higgins, that any pressure, equivalent to that of the atmosphere, as the pressure of a column of mercury, has the same effect. During crystallization a quantity of heat is rendered sensible. In many cases the volume of the substance crystallizing is enlarged, as in the example of water, of iron, and of the greater number of salts; but in others the volume is diminished. Quicksilver, in congealing, contracts about $\frac{1}{3}$ of its whole bulk; yet it exhibits the crystalline texture; and when the congelation is partial, the crystalline figure can even be discovered. Crystals deposited from water always contain a part of it which is retained by the affinity of the solid, and has passed with it into the concrete form. It is termed water of crystallization. Its quantity is very various; sometimes it equals or exceeds the weight of the solid, and sometimes it amounts only to a few parts in the hundred. Much of the cold produced during the solution of salts in water, is owing to this water of crystallization passing into the fluid state: hence crystallized salts generally produce more cold than when they are uncrystallized. If the water of crystallization be expelled from a crystal, it loses its transparency, and at length its form. Crystals which part with their water of crystallization when exposed to the atmosphere, are said to effloresce, and to deliquesce when they attract water and become humid. As different bodies require very different quantities of water for their solution, it is possible when two such bodies are dissolved in one fluid, to obtain them separate by crystallization, the one which is least soluble, or most disposed to crystallize, first passing into the solid form; and by farther evaporation the other is obtained. A fact on this subject, somewhat singular, is noticed by Mr. Kirwan. If into a saturated solution of two salts in water, a crystal of either be put, that salt crystallizes in preference to the other. By crystallization, also, salts, the solubility of which is unequally promoted by heat, may be obtained separately from the same solution. Thus, if one salt be much more soluble in hot than

than in cold water, and another be equally soluble, or nearly so, at any temperature, on evaporating the solution sufficiently, the latter salt will crystallize while the solution is hot; on cooling, the other will shoot into crystals; and, by alternate evaporation and cooling, the two may be obtained uncombined, though generally with a little intermixture of each other. Sometimes, however, when two salts are in solution in the same fluid, and have even different tendencies to crystallization, their mutual affinity leads them to crystallize in one mass, and even to assume a form different from that in which separately they would have crystallized. In other cases this mutual affinity, between substances in solution, is sufficient to resist their crystallization, or to render it more difficult. Crystallization sometimes takes place, when bodies in the gaseous form become subject to the attraction of aggregation, as in sublimates; and even solids separated from a liquid by chemical action, in some instances at the moment of their separation, assume a crystallized form. Every substance in crystallizing is disposed to assume a particular figure. Thus, sea-salt crystallizes in the form of a cube; nitre in that of a hexaedral prism; sugar in that of a four or six-sided prism, with triedral terminations. The crystalline figure in any substance, however, is not invariable, but may be altered by circumstances affecting the crystallization; and we find the same substance crystallized under a variety of forms. Sea-salt crystallizes, not only in cubes, but also in octaedrons; and carbonate of lime is found in nature in the form of an hexaedral prism, an hexaedral, and a triedral pyramid. The effect of light upon the act of crystallization is very remarkable. It is found, in general, that the crystals of salts are larger and better formed in the dark than when light falls upon the solution. But this relates only to such crystals as are formed in the fluid. In many, and indeed most salts, there are crystals formed, during the spontaneous evaporation of the solution, which rise above the surface into the air, either in contact with the sides of the vessel, or supported by their own structure. It appears to have been well determined by experiments of Chaptal and others, that this phenomenon does not take place without the presence of light.

CRYSTALLOGRAPHY, [from δ $\kappa\rho\upsilon\varsigma\alpha\lambda\lambda\alpha\varsigma$, glass or crystal, and $\gamma\rho\alpha\phi\omega$, to describe,] the science by which we understand the structure and forms of crystals. It is remarkable that crystals not only assume regular figures, but are always bounded by plane surfaces. It is very rarely indeed that curved surfaces are observed in these bodies; and when they are, the crystals always give unequivocal proofs of imperfection. But this constant tendency towards plane surfaces is inconceivable, unless the particles of which the crystals are composed are themselves regular figures, and bounded by plane surfaces. If the figure of crystals depend upon the figure of their integrant particles, and upon the manner in which they combine, it is reasonable to suppose that the same particles, when at full liberty, will always combine in the same way, and consequently that the crystals of every particular body will be always the same. Nothing at first sight can appear farther from the truth than this. The different forms which the crystals of the same body assume are often very numerous, and exceedingly different from each other. Carbonate of lime, for instance, has been observed crystallized in no fewer than forty different forms, fluat of lime in eight different forms, and sulphate of lime in nearly an equal number. But this inconsistency is not so great as might at first sight appear. Romé de Lisle has shewn that every body susceptible of crystallization has a particular form which it most frequently assumes, or at least to which it does most frequently approach. Bergman has demonstrated, that this primitive form, as Haüy has called it, very often lies concealed in those very crystals which appear to deviate farthest from it. And Haüy has demonstrated, that all crystals either have this primitive form, or at least contain it as a nucleus within them; for it may be extracted out of all of them by a skilful mechanical division. Haüy made this discovery of mechanical division in examining a hexangular prism of calcareous spar, or carbonate of lime, which had been detached from a group of the same kind: he observed that a small portion of the crystal was wanting, and that the fracture presented a very smooth surface. Let HX , fig. 1, Plate LIII. be the crystal: the fracture lay obliquely as the trapezium $abgc$, and made an angle of 135 degrees, both with the remainder of the base, and with the remainder of the side of the prism. Observing that the segment $abgc$ thus cut off had for its vertex e of the edges of the base of the prism,

he attempted to detach a similar segment in the part to which the next edge belonged; he employed for that purpose the blade of a knife, directed in the same degree of obliquity as the trapezium $abgc$, and assisted by the strokes of a hammer. He could not succeed: but on making the attempt upon the next edge he detached another segment, precisely similar to the first. He could produce no effect on the next or fourth edge; but from the next following, he cut a segment similar to the other two. The sixth edge likewise proved refractory. He then went to the other base of the prism, and found that the edges which admitted sections similar to the preceding ones were not the edges corresponding with those which had been found divisible at the opposite base, but the intermediate edges, as represented in fig. 1, where $abgc$ shews the base, and ed the vertex of the segments cut off from the first, third, and fifth edges of the base at one end, and the intermediate ones at the other end of the prism. The sections on the opposite sides and opposite ends are parallel, since they are alike inclined to the side, or to the base of the prism; thus the section $abgc$ marked A is parallel to that marked D, also B is parallel to E, and C to F. These sections were, without doubt, the natural joinings of the layers of the crystal; and he easily succeeded in making others parallel to them, without its being possible for him to divide the crystal in any other direction. In this manner he detached layer after layer, approaching always nearer and nearer the axis of the prism, till at last the bases disappeared altogether, and the prism was converted into a solid, fig. 2. terminated by twelve pentagons parallel two and two; of which those at the extremities, that is, the three marked $acgcb$, at the upper extremity, and $mo in$, at the lower, were the results of mechanical division, and had their common vertices g and i in the axis of the prism. The six lateral pentagons, viz. $macbn$, and $am onb$, three of each were the remains of the six sides of the original prism. By cutting off sections parallel to the former till mn coincided with ab in each face of the prism, there remained nothing of the lateral pentagons but the triangles acb , mno , see fig. 3. By continuing the same sections, these triangles at last disappeared, and the prism was converted into the rhomboid GI , fig. 4, which is therefore the primitive form, or nucleus of the crystal. Struck with the important result of this experiment, Haüy applied the same method to other crystalline forms of the same substance, and obtained from them the same result; the crystal, whatever was its figure, being by this mechanical division converted into a rhomb. Thus in the dodecaedron, composed of two six-sided pyramids joined by the base, the primitive form may be obtained at once by making a first section, on the edges EO , OI , fig. 5; a second, on the edges IK , GK ; a third, on GH , EH ; a fourth, on OI , IK ; a fifth, on GK , GH ; and lastly, a sixth, on EH , EO ; and the result is, that these edges become the same with the lateral edges of the primitive form, as may be perceived from mere inspection of fig. 6, which represents this primitive form described in the dodecaedron. He then applied it to other crystalline substances, and found, that from these also, by discovering the joints by which the laminae composing the crystals were united, a certain primitive form might be extracted. That of fluor spar, is an octaedron; and that of the heavy spar, a prism with rhomboidal bases; of corundum, a rhomboid somewhat acute; of beryl, a hexaedral prism; and of the elba iron-ore, a cube. Each of these forms is constant with regard to the species, and is that from which all the forms of the varieties, often extremely numerous, are derived. The latter are denominated by Haüy secondary forms. Sometimes, though rarely, the primitive and secondary forms are the same. All crystallized substances, however, do not admit of this mechanical analysis. But with regard to those that have hitherto refused it, Haüy has remarked, that their surface striated in a certain direction, or the relation subsisting among the different secondary forms of the same substance, mark with much probability, their primitive forms. Thus Haüy establishes what he names the "Primitive Form of Crystals," and which he defines, "A solid of a constant form, inserted symmetrically in all the crystals of the same species, and the faces of which observe the directions of the layers which compose these crystals." The primitive forms hitherto observed are reducible to six: the parallelopipedon, which includes the cube, the rhomb, and all the solids which are terminated by six faces parallel two and two; the tetraedron; the octaedron; the regular hexaedral prism; the dodecaedron, with equal and similar rhomboidal

boidal planes; and the dodecaedron with triangular planes. The primitive form may always be still farther subdivided parallel to its different faces, and sometimes even in other directions. All the enveloping matter is equally divisible by sections parallel to the faces of the primitive forms; and the only limit to this possible division is that placed by the composition of the substance. The calcareous spar, to take it as an example, may be reduced to a particle beyond which the division cannot be carried, without resolving it into its elements, lime and carbonic acid; or at least it may be reduced to a particle, beyond which, if its minuteness allowed us to operate upon it, it is demonstrable its figure would not change. To these last particles, the result of the mechanical analysis, Haüy gives the name of integrant particles, and their union constitutes the crystal. Their forms, so far as experiment has been carried, are three: the tetraedron, the simplest of the pyramids; the triangular prisma, the simplest of prisms; and the parallelopipedon, the simplest of solids, which have their faces parallel, two and two. It is very probable that between these the attraction of cohesion is immediately exerted. In order to complete the theory of the structure of crystals, it is requisite now to explain by what arrangements the secondary forms, or, in other words, the actually existing crystals, are produced. The nucleus of the crystal is the symmetrical solid which constitutes its primitive form, arising from the union of the integrant particles, either by their faces or their edges; and the additional matter, which forms the crystal, consists of layers of these particles super-added to that nucleus, and arranged on its faces; and to account for the formation of the crystal under a figure different from that of its primitive form, these layers, as they recede from it, are supposed to decrease, in the space they occupy, from the regular abstraction of one or more ranges of the integrant particles. This decrease may take place in various modes; and according to these, different figures of crystallization will be produced. Thus, to take the simplest example, let us suppose the primitive form is a cube; it is easy to conceive, that on each of its six sides may be reared a series of decreasing layers, or laminae, composed entirely of cubical particles, each layer diminishing on each of its edges by one row of the minute cubes of which it consists. The laminae thus decreasing as they recede from the base on which they rest, until the apex consists of a single particle, it is obvious, that on each side of the cube a four-sided pyramid will be formed. Two of these are represented, fig. 7, ABCD, EBCG. We shall thus have, then, six four-sided pyramids, and of course 24 triangles, such as ABC, BCE, CEG, &c. But since the decrease is uniform on all the sides, as from the line BC to A, and from the same line to E, it must also be uniform from A to E; it is obvious, therefore, that the side ABC of the one pyramid will be found exactly in the same plane as the side BCE of the adjacent pyramid; so that the entire surface of these will be the rhomb ABEC. The case must be the same with all the others. The 24 triangles will therefore be reduced to twelve rhombs, and the figure will be a dodecaedron, very remote from the primitive form. Now a crystal of this figure, and having this primitive form, would be resolved into that form, merely by cutting off the six solid angles, by sections, in the direction of the small diagonals of the sides, which go to the formation of these angles. We should thus successively uncover six squares, which will be the faces of the primitive cube. In explaining the structure of a crystal, although the representation in the figure be such as to shew the decrease of the laminae by rows of particles of such a size as to give a surface uneven, similar to a succession of steps, it is obvious, that if we substitute for this the delicate structure of nature, the number of laminae may be so great, and the number of their cubical particles such, that the depression or channel at their edges will be altogether imperceptible to our senses, and the surfaces will appear perfect planes. Thus we see, that a body which has the cube for the primitive form of its crystals, may have a dodecaedron for its secondary form. The formation of secondary crystals, by the superposition of laminae gradually decreasing in size, was first pointed out by Bergman. But Haüy has carried the subject much farther: he has not only ascertained all the different ways by which these decrements of the laminae may take place, but pointed out the method of calculating all the possible varieties of secondary forms which can result from a given primitive form; and consequently of ascertaining whether or not any given crystal

can be the secondary form of a given species. The decrements of the laminae which cover the primitive nucleus in secondary crystals are of four kinds:

1. Decrements on the edges, that is, on the edges of the slices which correspond with the edges of the primitive nucleus.

2. Decrements on the angles; that is to say, parallel to the diagonals of the faces of the primitive nucleus.

3. Intermediate decrements; *i. e.* parallel to lines situated obliquely between the diagonals and edges of the primitive nucleus.

4. Mixed decrements. In these the superincumbent slices, instead of having only the thickness of one integrant particle, have the thickness of two or more integrant particles; and the decrement, whether parallel to the edges or angles, consists not of the abstraction of one row of particles, but of two or more. Haüy denotes these decrements by fractions, in which the numerator indicates the number of rows of particles which constitutes the decrement, and the denominator represents the thickness of the laminae. Thus $\frac{3}{2}$ denotes laminae of the thickness of three integrant particles, decreasing by two rows of particles. An example of the first law of decrement, or of decrement on the edges is given above in the conversion of the cubic nucleus to a rhomboidal dodecaedron. In that example the decrement consisted of one row of particles, and it took place on all the edges. But these decrements may be more rapid: instead of one, they may consist of two, three, four, or more rows; and instead of taking place on all the edges, they may be confined to one or two of them, while no decrement at all takes place on the others. Each of these different modifications must produce a different secondary crystal. Besides this, the laminae may cease to be added before they have reached their smallest possible size; the consequence of which must be a different secondary form. Thus, in the example given above, if the superposition of laminae had ceased before the pyramids were completed, the crystal would have consisted of 18 faces; six squares parallel to the faces of the primitive nucleus, and 12 hexaedrons parallel to the faces of the secondary dodecaedron. This is the figure of the barate of lime and magnesia found at Luneburg. The second law in which the decrement is on the angles, or parallel to the diagonals of the faces of the primitive nucleus, will be understood from the following example: Let it be proposed to construct around the cube ABGF, fig. 8, considered as a nucleus, a secondary solid, in which the laminae of superposition shall decrease on all sides by single rows of cubes, but in a direction parallel to the diagonals. Let ABCD, fig. 9, the superior base of the nucleus, be divided into 81 squares, representing the faces of the small cubes of which it is composed. Fig. 10 represents the superior surface of the first lamina of superposition; which must be placed above ABCD, fig. 9, in such a manner, that the points *a b c d*, fig. 10, answer to the points *a b c d*, fig. 9. By this disposition the squares *Aa, Bb, Cc, Dd*, fig. 9, which compose the four outermost rows of squares parallel to the diagonals AC, BC, remain uncovered. It is evident also, that the borders QV, ON, IL, GF, fig. 10, project by one range beyond the borders AB, AD, CD, BC, fig. 9; which is necessary, that the nucleus may be enveloped towards these edges: for if this were not the case, re-entering angles would be formed towards the parts AB, BC, CD, DA, of the crystal; which angles appear to be excluded by the laws which determine the formation of simple crystals, or, which comes to the same thing, no such angles are ever observed in any crystal. The solid must increase, then, in those parts to which the decrement does not extend. But as this decrement is alone sufficient to determine the form of the secondary crystal, we may set aside all the other variations which intervene only in a subsidiary manner; except when it is wished, as in the present case, to construct artificially a solid representation of a crystal, and to exhibit all the details which relate to its structure. The superior face of the second lamina will be AGLK, fig. 11. It must be placed so that the points *a, b, c, d*, correspond to the points *a, b, c, d*, fig. 10; which will leave uncovered a second row of cubes at each angle, parallel to the diagonals AC and BD. The solid still increases towards the sides. The large faces of the laminae of superposition, which in fig. 10 were octagons, in fig. 11 arrive at the form of a square; and when they pass that term they decrease on all sides; so that the next lamina has for its superior face the square RMLS, fig. 12, less by one range in every direction than the preceding lamina, fig. 11. This square must be placed so that the points *e,*

f, g, h, fig. 12, correspond to the points *e, f, g, h*, fig. 11. Figures 13, 14, 15, and 16, represent the four laminae which ought to rise successively above the preceding; the manner of placing them being pointed out by corresponding letters, as was done with respect to the first three laminae. The last lamina *z*, fig. 17, is a single cube, which ought to be placed upon the square *z*, fig. 16. The laminae of superposition, thus applied upon the side *ABCD*, fig. 9, evidently produce four faces, which correspond to the points *A, B, C, D*, and form a pyramid. These faces, having been formed by laminae which began by increasing, and afterwards decreased, must be quadrilaterals of the figure represented in fig. 18; in which the inferior angle *C* is the same point with the angle *C* of the nucleus, figs. 9 and 10, and the diagonal *LQ* represents *LG* of the lamina *AGLK*, fig. 11. And as the number of laminae composing the triangle *LQC*, fig. 18, is much smaller than that of the laminae forming the triangle *ZLQ*, it is evident that the latter triangle will have a much greater height than the former. The surface, then, of the secondary crystal thus produced, must evidently consist of 24 quadrilaterals, for pyramids are raised on the other five sides of the primary cube exactly in the same manner, disposed three and three around each solid angle of the nucleus. But in consequence of the decrement by one range, the three quadrilaterals which belong to each solid angle, as *C*, fig. 8, will be in the same plane, and will form an equilateral triangle *ZLN*, fig. 19. The 24 quadrilaterals then will produce eight equilateral triangles; and consequently the secondary crystal will be a regular octaedron. This is the structure of the octaedral sulphuret of lead, and of muriate of soda. The third law is occasioned by the abstraction of double, triple, &c. particles. Fig. 20 exhibits an instance of the subtractions in question: and the molecule which compose the range represented by that figure are asserted in such a manner as if of two there were formed only one; so that we need only to conceive the crystal composed of parallelopipedons having their bases equal to the small rectangles *abcd, edfghi*, &c. to reduce this case under that of the common decrements on the angles. This particular decrement, as well as the fourth law, which requires no farther explanation, is uncommon. Indeed Häuy has met with mixed decrements only in some metallic crystals. These different laws of decrement account for all the different forms of secondary crystals. But in order to see the vast number of secondary forms which may result from them, it is necessary to attend to the different modifications which result from their acting separately or together. These modifications may be reduced to seven:

1. The decrements take place sometimes on all the edges, or all the angles, at once.
2. Sometimes only on certain edges, or certain angles.
3. Sometimes they are uniform, and consist of one, two, or more rows.
4. Sometimes they vary from one edge to the other, or from one angle to another.
5. Sometimes decrements on the edges and angles take place at the same time.
6. Sometimes the same edge or angle is subjected successively to different laws of decrement.
7. Sometimes the secondary crystal has faces parallel to those of the primitive nucleus, from the superposition of laminae not going beyond a certain extent.

Hence Mr. Häuy has divided secondary forms into two kinds, namely, simple and compound. Simple secondary crystals are those which result from a single law of decrement, and which entirely conceal the primitive nucleus. Compound secondary crystals are those which result from several laws of decrement at once; or from a single law which has not reached its limit, and which of course has left in the secondary crystal faces parallel to those of the primitive nucleus. "If amidst this diversity of laws (observes Mr. Häuy) sometimes united by combinations more or less complex, the number of ranges subtracted was itself extremely variable: for example, were these decrements by 15, 20, 30, or 40 ranges, or more, as might absolutely be possible; the multitude of the forms which might exist in each kind of mineral would be immense, and exceed what could be imagined. But the power which effects the subtractions seems to have a very limited action. These subtractions, for the most part, take place by one or two ranges of molecules. I have found none which exceed four ranges, except in a variety of calcareous spar forming part of the collection of C.

Gillet Laumont, the structure of which depends on a decrement by six ranges: so that if there exist laws which exceed the decrements by four ranges, there is reason to believe they rarely take place in nature. Yet notwithstanding these narrow limits by which the laws of crystallization are circumscribed, I have found, by confining myself to two of the simplest laws, viz. those which produce subtractions by one or two ranges, that calcareous spar is susceptible of 2044 different forms, a number which exceeds more than 50 times that of the forms already known: and if we admit into the combination decrements by three or four ranges, calculation will give 8,388,604 possible forms in regard to the same substance. And even this number may be much augmented in consequence either of intermediate or mixed decrements being taken into account. In concluding this sketch of Crystallography, extracted from the "System of Chemistry" by Murray, we have also thought it proper, with him, to give the figures of the more usual forms of crystals, and their modifications. The planes, which are the surfaces of crystals, are distinguished into lateral, or those which are of the greatest extent, and which form its confines towards its smallest extent; and extreme or terminal, which are those of smallest extent, and form the bounds of the body towards its largest extent. Edges are formed by the junction of two planes under determinate angles; they also are lateral, or those formed by the junction of two lateral planes; and terminal formed by the junction of two terminal planes, or of a terminal with a lateral plane. Werrerr admits even primary figures of crystals which are susceptible of numerous modifications. These figures are the icosaedron, the dodecaedron, the hexaedron, which includes the cube and the rhomb, the prism, the pyramid, the table, and the lens. 1st. The icosaedron, fig. 21, is a solid, consisting of twenty equilateral triangular planes, united under equal angles. 2d. The dodecaedron, fig. 22, or solid of twelve equal or pentagonal faces. 3d. The cube, fig. 23, or solid, composed of six quadrilateral planes united at right angles. 4th. The rhomb, fig. 24, or solid, of six quadrilateral planes united at oblique angles. 5th. The prism, or solid, of two terminal planes, parallel, equal, and similar, connected by quadrangular lateral planes having one direction; the number of lateral planes may of course be various; the usual form observed in crystals are the four-sided rectangular prism, fig. 25; and the six-sided equiangular prism, fig. 27. 6th. The pyramid, or solid, the base of which is a plane of an indeterminate number of sides, and the sides triangles, the vertices of which meet in one point, forming the summit: the more common varieties of this figure, as forms of crystals, are the three-sided pyramid, or tetraedron, fig. 28, and the four-sided pyramid, fig. 29. 7th. The table, which, strictly speaking, is nothing but a very compressed prism; it is defined as composed of two parallel lateral planes, and of an indeterminate number of terminal planes, connected with the lateral planes and with each other, and small, compared with the lateral ones; the principal varieties are, the oblique-angular, or rhomboidal four-sided table, fig. 30; the rectangular four-sided table, fig. 31, and the six-sided table, fig. 32. Lastly, The lens, fig. 33, a solid, consisting only of two planes, which are curved; of which there are two varieties, one composed of two convex planes, and another composed of a convex and a concave plane. These simple figures are modified by combination, by truncation, by bevelment, and by acumination. The modification by combination is confined to the pyramids, and these are frequent, two pyramids being joined by the base; the lateral planes of the one being set either directly on the lateral planes of the other, as in the double four-sided pyramid, octaedron, fig. 36, or obliquely, as in the double four-sided pyramid, fig. 35. Fig. 34, is the double six-sided pyramid. A crystal is said to be truncated, when any or all of its solid angles or edges appear cut off, so that where there would have been an edge or angle we have a plane. Fig. 37, shews the cube with the angles and edges truncated: fig. 38, the six-sided prism, with truncated terminal edges. A crystal is said to be bevelled, when its edges, angles, or terminal planes, are so altered, that instead of an angle edge or terminal plane, there appear two smaller converging planes, which terminate in an edge: fig. 39, shews the cube with bevelled edges: fig. 40, the three-sided pyramid, with bevelled edges. Lastly, the forms of crystals are altered by acumination. This is that kind of alteration in which, in place of the angles or terminal planes of a crystal, there are three or more planes converging and forming a point or edge: fig. 41, shews the cube, with angles acuminated by three planes set

on the lateral planes: fig. 42, the rectangular four-sided prism, acuminate by four planes set on the lateral planes. The forms of crystals from the preceding modifications are frequently still more altered, and rendered complicated, by being super-added and combined; and by the extent of the modifications, one form frequently passes into another. The figures of crystals are likewise rendered complicated by aggregation, two or more crystals of the same substance being more or less closely united. A minute detail of this article may be found in Weaver's translation of the "External Characters of Minerals," by Werner; or in Professor Jameson's treatise on the same subject.

CRYPTANDRA, in botany, a genus of the class pentandria, and order monogynia. Calyx five-leaved; corolla tubular, with a five-cleft border; stigma three-cleft; capsule three-valved, three-celled, superior; seeds single, compressed. It has but one species a shrub, native of Australasia.

CTESIBUS, a mathematician of Alexandria, who flourished about B. C. 120. He was the first who invented the pump. He also invented a clepsydra, or water-clock. Water was let drop upon wheels which it turned: the wheels communicated their regular motion to a small wooden image, which by a gradual rise pointed with a stick to the proper hours and months, which were engraved on a column near the machine.

CTESIPHON, a celebrated Greek architect, who gave the designs for the famous temple of Ephesus, and invented a machine for bringing thither the columns to be used in that noble structure. He flourished B. C. 544.

CUB, in zoology. See **URSUS**.

CUB, NORTH, a small island of N. America, in James's Bay, E. of Hudson's Bay.

CUB, SOUTH, another island in James's Bay.

CUBA, a large and important island in the West Indies, belonging to Spain; 700 miles long and 87 broad. On the E. it begins at 20° 20' Lat. N. touches the tropic of Cancer on the N. and extends from 74° to 85° 15' Lon. W. It lies 60 miles W. of Hispaniola, 75 N. of Jamaica, 100 E. of Yucatan, and as many to the S. of Cape Florida. It was discovered by Columbus in 1492, who gave it the name of Ferdinando, in honour of king Ferdinand of Spain; but it soon after recovered its ancient name of Cuba.

CUBEA, in botany, a genus of the class decandria, and order monogynia. Calyx turbinate, five-parted, unequal, permanent; petals five, unequal; filaments villose, three shorter; legume villose, six, or seven-seeded. It has two species.

CUBAGUA, an island of S. America, eight miles long, near Cumana, between Margarita and Terra Firma, discovered by Columbus.

CUBAN, a large river of Russian Tartary, formed by the junction of many small streams, that rise in Mount Caucasus, between the Black Sea and the Caspian.

CUBATURE, [from *cube*,] is the finding of the solid content of any proposed body.

CUBE, [from *κύβος*, a die,] in geometry, a regular solid body, contained under six square and equal faces or sides, and the angles all right, and therefore equal, as fig. 28, Plate XLVII. See **GEOMETRY**, and **MENSURATION**.

CUBE, or **CUBIC NUMBER**, in arithmetic, that which is produced by the multiplication of a square number by its root, thus, 64 is a cube number, and arises by multiplying 16, the square of four, by the root four. See **ARITHMETIC**.

CUBE, or **CUBIC QUANTITY**, in algebra, the third power in a series of geometrical proportionals continued; as *a* is the root, *aa* the square, and *aaa* the cube. All cubic numbers may be ranged into the form of cubes; as 8 or 27, whose sides are two and three, and their bases four and nine; whence it appears, that every true cubic number, produced from a binomial root, consists of these parts, viz. The cubes of the greater and less parts of the root, and of three times the square of the greater part multiplied by the less, and of three times the square of the less multiplied by the greater, as,

$$\begin{aligned} & a + b \\ & aaa + 2aab + bbb \\ & \quad aab + 2abb + bbb \\ & aaa + 3aab + 3abb + bbb \end{aligned}$$

From hence it is easy to understand both the composition of any

cubic number, and the reason of the method for extracting the cube root out of any member given. See **ALGEBRA**.

CUBE ROOT OF ANY NUMBER, OR QUANTITY, such a number, or quantity, which, if multiplied into itself, and then, again, the product thence arising by that number or quantity, being the cube root, this last product shall be equal to the number or quantity whereof it is the cube root, as two is the cube root of eight, because two times two is four, and two times four is eight; and $a + b$ is the cube root of $a^3 + 3a^2b + 3ab^2 + b^3$. See **ALGEBRA**.

CUBE, DUPLICATION OF THE, is the finding of the side of a cube that shall be double in solidity a given cube, which is a celebrated problem, much discussed by ancient geometers. It was first proposed by the oracle of Apollo at Delphos, which declared that the plague, then raging at Athens, should cease when Apollo's altar, a cube, was doubled. Upon this the mathematicians applied themselves seriously to seek the duplicature of the cube; hence it is called the Delian problem. It cannot, however, be effected geometrically, as it requires the solution of a cubic equation, or requires the finding of two mean proportionals, viz. between the sides of the given cube and the double of the same, the first of which two mean proportions is the side of the double cube, as was first observed by Hippocrates of Chios. For, let *a* be the side of the given cube, and *z* the side of the double cube sought; then it is $z^3 = 2a^3$, or $a^2 : z^2 :: z : 2a$; so that, if *a* and *z* be the first and second terms of a set of continued proportionals, then $a^2 : z^2$ is the ratio of the square of the first to the square of the second, which, it is known, is the same as the ratio of the first term to the third, or of the second to the fourth, that is, of *z* to $2a$; therefore *z* being the second term, $2a$ will be the fourth. So that *z*, the side of the cube sought, is the second of four terms in continued proportion; the first and fourth being *a* and $2a$, that is, the side of the double cube is the first of two mean proportionals between *a* and $2a$. This problem has been frequently solved mechanically by Archimedes, Eutochius, Pappus, &c.

CUBIC, or CUBICAL, EQUATION, in algebra, one whose highest power consists of three dimensions, as $x^3 = a^3 - b^3$, or $x^3 + rxx = p$, &c. See **ALGEBRA**.

CUBIC FOOT OF ANY SUBSTANCE, so much of it as is contained in a cube, whose side is one foot.

CUBIT, [*cubitus*, Lat.] in the mensuration of the ancients, a long measure, equal to the length of a man's arm, from the elbow to the tip of the fingers. Dr. Arbuthnot makes the English cubit equal to 18 inches; the Roman cubit equal to one foot, 5,406 inches; and the cubit of the scripture equal to one foot, 9,888 inches.

CUBITEUS. See **ANATOMY**.

CUBITUS, [Lat.] in anatomy, a bone of the arm, reaching from the elbow to the wrist, otherwise called the ulna.

CUBOIDES, Os, or Os **CUBIFORME**, in anatomy, the 7th bone of the foot; so called from its being in form of a cube, from *κύβος*, cube, and *μοῖον*, likeness.

CUCKFIELD, a town in Sussex, 40 miles S. by W. of London.

CUCKING-STOOL, an engine invented for the punishment of scolds and unquiet women, which formerly was called tumble.

CUCKING-STOOL, in Doomsday, is called cathedra stercoris; and it was in use even in the Saxon time. It was anciently also a punishment inflicted upon brewers and bakers transgressing the laws; who were in such a stool immersed over head and ears in *stercore*, some stinking water. Some think it a corruption from ducking-stool; others from choking-stool, because the delinquents were nearly suffocated in the water.

CUCKOO, or **CUCKOW**. See **CUCULUS**.

CUCKOO-FLOWER. See **CARDAMINE**.

CUCKOO PINT. See **ARUM**.

CUCUBALUS, **BERRY-BEARING CHICKWEED**: a genus of the trigynia order, and decandria class of plants; natural order, Caryophyllae. Calyx inflated; petals five, unguiculated without a nectariferous corona at the throat; capsule trilocular. There are seventeen species.

CUCULUS, in natural history, a genus of the coleoptera order of insects: antenna filiform; feelers four, equal, the last joint truncate, thicker; lip short, bifid, the divisions linear and distant; body depressed. There are about thirteen species.

CUCULLARIA, in botany, a genus of the class and order, monandria monogynia. Calyx four-parted; corolla four-petaled, unequal, spurred; filaments petal-like; anthers with distinct cells. It has only one species, a native of Guiana.

CUCULLANUS,

CUCULLANUS, in natural history, a genus of the vermes intestina. Body sharp, pointed behind and obtuse before; mouth orbicular, with a striate hood. Most of this genus are viviparous, and generally intestinal. There are four sections: A, infesting the mammalia; B, infesting birds; C, infesting reptiles; and D, infesting fish. It has seven species besides varieties.

CUCULUS, the Cuckoo, in ornithology, a genus of the order pica. Bill smooth, and more or less bending; nostrils bounded by a small rim; tongue short and arrowed; toes two forward and two backward; tail wedge-formed of ten soft feathers. Gmelin enumerates fifty-five species, and Latham forty-six.

C. CANORUS, the COMMON CUCKOO, weighs about five ounces; and is in length 14 inches; in breadth 25. The bill is black, and about two-thirds of an inch in length. The head, hind part of the neck, coverts of the wings and rump, are of a dove colour; darker on the head and paler on the rump. The throat and upper part of the neck are of a pale grey; the breast and belly white, crossed elegantly with undulated lines of black. The tail consists of ten feathers of unequal lengths; the two middle tail feathers are black tipped with white; the others are marked with white spots on each side their shafts. On the natural history of this singular bird, a very curious paper was published by Dr. Jenner, in the Philosophical Transactions, for 1788, Part II. Art. 14. It is almost universally allowed, that the cuckoo does not hatch its own eggs. The hedge-sparrow, the water wagtail, the titlark, the red-breast, the yellow hammer, the green linnet, or the winchat; is generally the nurse of the young cuckoo: but Buffon enumerates twenty sorts of nests at least in which they have deposited their eggs. It may be supposed, that the female cuckoo lays her egg in the absence of the bird in whose nest she intends to deposit; as it has been known, that on sight of one of these a redbreast and its mate jointly attacked her on approaching the nest, putting her to flight; and so effectually drove her away, that she did not dare to return. Among the birds above-mentioned it generally, according to the Dr's. observations, selects the three first, but shews a much greater partiality to the hedge-sparrow. This last commonly takes up four or five days in laying her eggs. During this time (generally after she has laid one or two) the cuckoo deposits her egg among the rest, leaving the future care of it entirely to the hedge-sparrow. This intrusion often occasions some discomposure; for the old hedge-sparrow at intervals, whilst she is sitting, not unfrequently throws out some of her own eggs, and sometimes injures them in such a way that they become addle; so that it frequently happens that only two or three hedge-sparrow's eggs are hatched with the cuckoo's. But whether this be the case or not, she sits the same length of time as if no foreign egg had been introduced, the cuckoo's egg requiring no longer incubation than her own. When the hedge-sparrow has sat her usual time, and disengaged the young cuckoo and some of her own offspring from the shell, her own young ones, and any of her eggs that remain unhatched, are soon turned out, the young cuckoo remaining possessor of the nest, and sole object of her future care. The young birds are not previously killed, nor are the eggs demolished; but all are left to perish together, either being entangled about the bush which contains the nest, or lying on the ground under it. "The early fate of the young hedge-sparrows (says Dr. Jenner) is a circumstance that has been noticed by others, but attributed to wrong causes. A variety of conjectures have been formed upon it. Some have supposed the parent cuckoo the author of their destruction; while others, as erroneously, have pronounced them smothered by the disproportionate size of their fellow nestling. The following is one of the many curious observations of the Dr. to shew how this is effected. June 18, 1787, I examined the nest of a hedge-sparrow, which then contained a cuckoo's and three hedge-sparrow's eggs. On inspecting it the day following, I found the bird had hatched, but that the nest now contained only a young cuckoo and one young hedge-sparrow. The nest was placed so near the extremity of a hedge, that I could distinctly see what was going forward in it; and to my astonishment, saw the young cuckoo, though so newly hatched, in the act of turning out the young hedge-sparrow. The mode of accomplishing this was very curious. The little animal, with the assistance of its rump and wings, contrived to get the bird upon its back; and making a lodgement for the burden by elevating its elbows, clambered backward with it up the side of the nest till it reached the top; where resting for a moment, it threw off its load with a jerk, and quite disengaged it

from the nest. It remained in this situation a short time, feeling about with the extremities of its wings, as if to be convinced whether the business was properly executed, and then dropped into the nest again. With these (the extremities of its wings) I have often seen it examine, as it were, an egg and nesting before it began its operations; and the nice sensibility which these parts appeared to possess, seemed sufficiently to compensate the want of sight, which as yet it was destitute of. I afterwards put in an egg; and this, by a similar process, was conveyed to the edge of the nest and thrown out. These experiments I have since repeated several times in different nests, and have always found the young cuckoo disposed to act in the same manner. In climbing up the nest, it sometimes drops its burden, and thus is foiled, in its endeavours; but, after a little respite, the work is resumed, and goes on almost incessantly till it is effected. It is wonderful to see the extraordinary exertions of the young cuckoo, when it is two or three days old, if a bird be put in the nest with it that is too weighty for it to lift out. In this state it seems ever restless and uneasy. But this disposition for turning out its companions begins to decline from the time it is two or three till it is about twelve days old; when, as far as I have hitherto seen, it ceases. See Plate XXXVIII.

C. CAPENSIS, the CAPE CUCKOO of Buffon, is a little smaller than ours; the bill is a deep brown; the upper part of the body greenish brown; throat, cheeks, fore-part of the neck, and upper wing coverts, of a deep rufous colour; tail feather rufous, but paler, tipped with white; the breast, and all the under parts of the body, white, crossed with lines of black; the legs reddish brown. It inhabits the Cape of Good Hope; and is probably the same bird which is called Edolio, from its pronouncing that word frequently in a low melancholy tone.

C. INDICATOR, or the HONEY GUIDE, is a native of Africa. The following description is given of it by Dr. Sparrman, in the Philos. Trans. for 1777. "This curious species of cuckoo is found at a considerable distance from the Cape of Good Hope, in the interior parts of Africa, being entirely unknown at that settlement. The first place I heard of it was in a wood, called the Groot-vaader's Bosch, the Grand-father's Wood, situated in a desert near the river which the Hottentots call T'kant'kai. The Dutch settlers thereabouts have given this bird the name of honi-guyzer, or honey-guide, from its quality of discovering wild honey to travellers. Its colour has nothing striking or beautiful. Its size is considerably smaller than that of our cuckoo in Europe: but in return, the instinct which prompts it to seek its food in a singular manner is truly admirable. The honey being its favourite food, its own interest prompts it to be instrumental in robbing the hive, as some scraps are commonly left for its support. The morning and evening are its times of feeding, and it is then heard calling in a shrill tone, cherr, cherr; which the honey-hunters carefully attend to as the summons to the chace. From time to time they answer with a soft whistle; which the bird hearing, always continues its note. As soon as they are in sight of each other, the bird gradually flutters toward the place where the nest is situated, continually repeating its former call of cherr, cherr; nay, if it should happen to have gained a considerable way before the men (who may be easily hindered in the pursuit by bushes, rivers, or the like,) it returns to them again, and redoubles its note, as it were to reproach them with their inactivity. At last the bird is observed to hover for a few moments over a certain spot, and then silently retiring to a neighbouring bush or resting place, the hunters are sure of finding the bees nest in that identical spot: whether it be in a tree or in the crevice of a rock, or (as is most commonly the case) in the earth. While the hunters are busy in taking the honey, the bird is seen looking on attentively to what is going forward, and waiting for its share of the spoil. The bee-hunters never fail to leave a small portion for their conductor; but commonly take care never to leave so much as would satisfy its hunger. The bird's appetite being whetted by this parsimony, it is obliged to commit a second treason, by discovering another bee's nest, in hopes of a better salary.

C. NITENS, the SHINING CUCKOO, is the size of a small thrush: the bill is bluish: the upper part of the body green, with a rich gilded gloss; the under parts are white, transversely waved with green gold; the under tail coverts almost white; the quills and tail dusky brown; the legs are bluish. This inhabits New Zealand, where it is called Poopo-arowro. See Plate XXXVIII.

C. VETULA is a little bigger than a blackbird: the bill above

an inch and a half long: the upper mandible black; the lower whitish: crown of the head brown, the feathers of it soft and silky; the upper parts of the body and the quills cinereous olive. This species inhabits Jamaica, where it is common in the woods and hedges all the year round. It feeds on seeds, small worms, and caterpillars, and is very tame. It is called *tacco* from its cry, which is like that word; the first syllable is pronounced hardly, the other following in a full octave lower than the first. It has also another cry like *qua, qua, qua*; but that only when alarmed by an enemy.

CUCUMIS, a genus of the syngenesia order, and monœcia class of plants; natural order, Cucurbitaceæ. Male calyx quinque-dentated; corolla quinquepartite; filaments three; female calyx quinque-dentated; corolla quinquepartite; pistil trifid; pome with argute seeds. In this genus Linnaeus includes the Melon. There are thirteen species.

C. COLOCYNTHIS, the **COLOCYNTH**, **COLOQUINTIDA**, or **BITTER APPLE** of the shops, is brought to us from Aleppo, and the island of Crete, the leaves of the plant are large, placed alternate, almost round, and stand upon footstalks four inches long. The shelly or husky outside incloses a bitter pulp interspersed with flatish seeds. The pulp dried and powdered is commonly used as a purgative in this country. If taken in a large dose, it not only often brings away blood, but produces colics, convulsions, ulcers in the bowels, and fatal super-purgations. The most effectual corrector of these virulent qualities is to triturate it finely with sugar or sweet almonds.

C. SATIVA, the **COMMON CUCUMBER**, is well known: it has many varieties. Cucumbers in this country are raised at three different seasons of the year: 1. on hot-beds, for early fruits; 2. under bell or hand-glasses, for the middle crop; 3. on the common ground, which is for the late crop, or to pickle.

CUCURBIT, in chemistry, an earthen or glass vessel, so called from its resemblance to a gourd, arising gradually from a wide bottom, and terminating in a narrow neck.

CUCURBITA, the **GOURD** and **POMPION**, a genus of the syngenesia order, and monœcia class of plants; natural order, Cucurbitaceæ. Calyx of the male quinque-dentated; corolla quinquefid; filaments three: calyx of the female quinque-dentated; corolla quinquefid; pistil quinquefid; seeds of the pome with a tumid margin. Seven species, annuals, with trailing herbaceous stems, furnished with tendrils for climbing; they are very much like the cucumis.

CUCURBITACEÆ, in botany, the name of the thirty-fourth order in Linnaeus's fragments of a natural method, consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities. These are divided into two sections. 1. Those with hermaphrodite flowers, as the passion-flower. 2. Those with male and female flowers produced either on the same or distinct roots, as the cucumber, &c. See **BOTANY**.

CUDDALORE, a town of Hindostan, on the coast of Coromandel, 15 miles S. S. W. of Pondicherry.

CUDDAPA, a territory of Hindostan, west of the Carnatic.

CUDDAPA, the capital of the above territory, seated on the river Pennar, 95 miles W. by N. from its mouth.

CUDDY, in a first-rate man of war, is a place lying between the captain-lieutenant's cabin and the quarter-deck; and divided into partitions for the master and other officers.

CUDWEED. See **GNAPHALIUM**.

CUENCA, a considerable district of South America, in the province of Quito in Peru.

CUENCA, or **BAMBA**, the capital of the above district, 170 miles S. of Quito.

CUENCA, or **CUENZA**, a town of Spain, in New Castile, and in the territory of Sierra, with a bishop's see.

CUJAVIA, a territory of Great Poland, having the duchy of Prussia on the N. It contains two palatinates, the chief towns of which are Inowloez and Brest; as also Uladislav, the capital of the district.

CUIRASS, a piece of defensive armour, made of iron plate, well hammered, serving to cover the body, from the neck to the girdle, both before and behind. It was not brought into use till about A. D. 1300, though they were known both to the ancient Greeks and Romans in different forms.

CUL, [Fr. *i. e.* a bottom, *Cul de Sac*, a street that has no way out.] in geography, applied metaphorically, denotes a bay, and makes part of the names of several bays.

CULDEES, in church history, a sort of monkish priests, formerly inhabiting Scotland and Ireland. Being remarkable for the religious exercises of preaching and praying, they were called, by way of eminence, *cultores Dei*; whence is derived the word *culdees*. They made choice of one of their own fraternity to be their spiritual head, who was afterwards called the Scots bishop.

CULEMBACH, or **CULMBACH**, a marquise of Germany in the circle of Franconia. It is about 50 miles long from N. to S. and 30 broad from E. to W. and contains 54 towns. It is full of forests and high mountains, covered with pine-trees, and abounds with copper, iron, lead, alum, sulphur, antimony, and marble. Here are the sources of four large rivers, the Maine, the Sala, the Eger, and the Nab.

CULEMBACH, the capital of the marquise. It has good fortifications, and is seated 25 miles N. E. of Bamberg.

CULEUS, in Roman antiquity, the largest measure of capacity for things liquid, containing 20 amphora, or 40 urnæ. It contained 143 gallons 3 pints, English wine measure; and was 11,095 solid inches.

CULEX, the **GNAT**; a genus of insects of the order diptera. Mouth formed by a flexible sheath, inclosing bristles pointed like stings; antennæ of the males filiform; those of the females feathered. There are fourteen species. These insects, too well known by the severe punctures they inflict, and the itchings thence arising, afford a most interesting history. Before they turn to flying insects, they have been in some manner fishes, under two different forms. One may observe in stagnating waters, from the beginning of May till winter, small grubs with their heads downwards, their hinder parts on the surface of the water; from which part arises sideways a kind of vent-hole, or small hollow tube like a funnel, and this is the organ of respiration. The head is armed with hooks, that serve to seize on insects and bits of grass on which it feeds. On the sides are placed four small fins, by the help of which the insect swims about, and dives to the bottom. These larvæ retain their form during a fortnight or three weeks, after which period they turn to chrysalids. All the parts of the winged insect are distinguishable through the outward robe that shrouds them. The chrysalids are rolled up into spirals. The situation and shape of the windpipe is then altered; it consists of two tubes near the head, which occupy the place of the stigmata, through which the winged insect is one day to breathe. These chrysalids, constantly on the surface of the water in order to draw breath, abstain now from eating; but upon the least motion are seen to unroll themselves, and plunge to the bottom, by means of little paddles situated at their hinder parts. After three or four days fasting they pass to the state of gnats. A moment before, water was its element; but now, become an aerial insect, he can no longer exist in it. He swells his head, and bursts his inclosure. The robe he lately wore, turns to a ship, of which the insect is the mast and sail. If at the instant the gnat displays his wings there arise a breeze, it proves to him a dreadful hurricane; the water gets into the ship, and the insect, who is not yet loosened from it, sinks and is lost. But in calm weather, the gnat forsakes his slough, dries himself, flies into the air, seeks to pump the alimentary juice of leaves, or the blood of man and beasts. The sting which our naked eye discovers, is but a tube, containing five or six spicula of exquisite minuteness; some deputed at their extremity like the head of an arrow, others sharp-edged like razors. These spicula introduced into the veins, act as pump-suckers into which blood ascends by reason of the smallness of the capillary tubes. The insect injects a small quantity of liquor into the wound, by which the blood becomes more fluid, and is seen through the microscope passing through those spicula. The animal swells, grows red, and does not quit its hold till it has gorged itself. The liquor it has injected causes by its fermenting that disagreeable itching which we experience; and which may be removed by volatile alkali, or by scratching the part newly stung, and washing it instantly with cold water; for if later, the venom ferments, and the tumor and the itching are only increased by friction. Rubbing one's self at night with fuller's earth and water, lessens the pain and inflammation. Gnats perform their copulation in the air. The female deposits her eggs on the water; by the help of her moveable hinder part and her legs, placing them one by the side of another in the form of a little boat. This vessel, composed of two or three hundred eggs, swims on the water for two or three days, after which they are hatched. If a storm arises, the boats

boats are sunk. Every month there is a fresh progeny of these insects. Were they not devoured by swallows, and other birds, as well as by several carnivorous insects, the air would be darkened by them.

C. PAPIENS, the **MUSKETO FLY**, is the most troublesome species of the whole genus; and swarms in the West Indies. In the daytime or at night they come into the houses; and when the people are gone to bed they begin their disagreeable humming, approach always nearer to the bed, and at last suck up so much blood that they can hardly fly away. Their bite causes blisters in people of a delicate complexion. When the weather has been cool for some days, the musquitoes disappear; but when it changes again, and especially after a rain, they gather frequently in such quantities about the houses, that their numbers are astonishing. In sultry evenings they accompany the cattle in great swarms, from the woods to the houses or to town; and when they are driven before the houses, the gnats fly in wherever they can. In the greatest heat of summer, they are so numerous in some places that the air seems to be quite full of them, especially near swamps and stagnate waters, such as the river Morris in New Jersey. The inhabitants therefore make a fire before their houses to expel these disagreeable guests by the smoke.

CULIACAN, a province of Guadalupe, in Mexico.

CULIACAN, the capital of the province, 480 miles N. W. of Mexico. Lon. 108. 5. W. Lat. 24. 20. N.

CULLEN, **DR. WILLIAM**, an eminent physician, was born in the county of Lanark in Scotland in 1712, and served his apprenticeship to a surgeon at Glasgow. On the expiration of his time he went surgeon in a merchant-ship to the West Indies, and on his return, he established himself in business, in partnership with Dr. William Hunter. In 1740 he took his degree of M. D. and in 1746 he was chosen lecturer in chemistry at Glasgow. In 1761 he was appointed king's professor of medicine in the same university. In 1765 he was elected professor of chemistry at Edinburgh, where, in 1766, he was chosen to the medical chair, in which he raised the reputation of that university to an unequalled height in physical science. He died in 1790. His "First Lines of Physics," 4 vols. 8vo. are too well known to need praise in this place; besides which, he was the author of "Synopsis Nosologiae Methodicae," 2 vols. 8vo. a class book for medical students; "Lectures on Materia Medica," 2 vols. 4to.; and a pamphlet on the recovery of persons drowned and seemingly dead, 8vo. Dr. Cullen "was the first person in Scotland, who understood the Linnaean system of botany, and recommended it to his pupils, at a time when it met with much opposition from others."

CULLODEN MOOR, a heath in Inverness-shire, memorable for a victory gained over the adherents of the house of Stuart, on the 16th of April, 1746.

CULM, or **CULMUS**, in botany, a straw, or haulm, the proper trunk of grasses which elevates the leaves, flower, and fruit.

CULM, in geography, a town of the late Polish Prussia, capital of a palatinate of the same name, and the see of a bishop. It is 18 miles N. N. W. of Thorn. Lon. 18. 30. E. Lat. 53. 24. N.

CULMINATION, in astronomy, the passage of any heavenly body over the meridian, or its greatest altitude for that day.

CULMORE, a town of Ireland, in Londonderry, 5 miles N. of Londonderry.

CULPRIT, is not (as is vulgarly imagined) an opprobrious name given to the prisoner before he is found guilty, but it is the reply of the clerk of arraigns to the prisoner, after he had pleaded Not Guilty; which plea was anciently entered upon the minutes in an abbreviated form, non cul; upon which the clerk of the arraigns, on behalf of the crown, replies that the prisoner is guilty, and that he is ready to prove him so; which is done by a like kind of abbreviation, cul'prit, signifying that the king is ready to prove him guilty (from cul, that is, culpabilis, guilty; and prit, praesto sum, I am ready to verify it). 4 Black. 339.

CULROSS, a town of Scotland, on the river Forth, 23 miles N. W. of Edinburgh.

CULVERIN, a long slender piece of ordnance or artillery, serving to carry a ball to a great distance. Manege derives the word from the Latin *colubrina*; others from *coluber*, a snake; either on account of the length and slenderness of the piece, or of the ravages it makes. There are three kinds of culverins, viz. the extraordinary, the ordinary, and the least sized 1. The culverin

extraordinary has $5\frac{1}{2}$ inches bore; its length 32 calibres, or 13 feet; weighs 4800 pounds: its load above 12 pounds; carries a shot $5\frac{1}{2}$ inches diameter, weighing 20 pounds weight. 2. The ordinary culverin is 12 feet long; carries a ball of 17 pounds 5 ounces; calibre $5\frac{1}{2}$ inches; its weight 4500 pounds. 3. The culverin of the least size, has its diameter 5 inches; is 12 feet long; weighing about 4000 pounds; carries a shot $3\frac{1}{2}$ inches diameter, weighing 14 pounds 9 ounces.

CULVERTAIL, among ship-wrights, signifies the fastening or letting of one timber into another, so that they cannot slip out, as the corlings into the beams of a ship.

CUMA, a small island in the Mediterranean, near the coast of Italy, 5 miles W. of Naples.

CUMA, a town of the island of Gillo, situated at the bottom of a large bay.

CUMA, or **CUMÆ**, in ancient geography, a town of Æolia in Asia Minor.

CUMÆ, or **CUMA**, in ancient geography, a city of Campania near Puteoli, founded by a colony from Chalcis and Cumæ of Æolia before the Trojan war.

CUMANA, **COMANA**, or **NEW CORDOVA**, a town of South America, and capital of New Andalusia. Lon. 63. 39. W. Lat. 9. 46. N.

CUMBERLAND, or **CUMBRIA**, so denominated from the Cumbri, or Britons, who inhabited it; one of the most northerly countries in England. It was formerly a kingdom extending from the vallum of Adrian to the city of Dunbritton, now Dumbarton, on the frith of Clyde in Scotland. At present it is a county of England, bounded on the N. and N. W. by Scotland; on the S. and S. E. by part of Lancashire and Westmoreland. The county produces great quantities of coal, some lead, and abundance of the mineral earth called black-lead. It has several mines of lapis calaminaris, and an inconsiderable pearl-fishery on the coast near Raven-glass.

CUMBERLAND, a county and town of North America, in New Brunswick.

CUMBERLAND, a county of the United States, in the district of Maine, between York and Lincoln counties.

CUMBERLAND, a county of the United States, in New Jersey.

CUMBERLAND, a county of North Carolina.

CUMBERLAND, a county of Pennsylvania.

CUMBERLAND, a county of Virginia.

CUMBERLAND, an island of the United States, off the coast of Camden county, Georgia.

CUMBERLAND ISLAND, an island in the South Pacific ocean. Lon. 140. 36. W. Lat. 19. 18. S.

CUMBERLAND ISLANDS, a cluster of islands near the N. E. coast of New Holland. Lon. 148. 32. E. Lat. 20. 36. S.

CUMBERLAND RIVER, called by the Indians Shawanee, and by the French Shavanon, falls into the Ohio 10 miles above the mouth of Tennessee river.

CUMBRAES, **CIMBRAES**, **CAMBRAY**, or **CUMBRAY**, an island and parish of Scotland, in Ayrshire, lying in the Frith of Clyde.

CUMINUM, **CUMMIN**: a genus of the digynia order, and pentandria class of plants; natural order, Umbellatæ. Fruit ovate and striated; partial umbels four; involucre quadrifid. One species only is known.

CUNEIORM BONE is the same with the os basilare and os sphenoides. See ANATOMY.

CUNEUS, in antiquity, a company of infantry drawn up in form of a wedge, the better to break through the enemy's ranks.

CUNICULUS, in mining, a term used by authors in distinction from puteus, to express the several sorts of passages and cuts in these subterranean works. The cuniculi are those direct passages in mines where they walk on horizontally; but the putei are the perpendicular cuts or descents.

CUNICULUS, in zoology. See LEPUS.

CUNILA, in botany, a genus of the monogynia order, and monandria class; natural order, Verticillatæ. Corolla ringent, with its upper lip erect and plane; two filaments, castrated, or wanting antheræ; seeds four. There are four species.

CUNINA, in mythology, the goddess who had the care of little children.

CUNITZ, MARY, one of the greatest geniuses in the 16th century,

century, was born in Silesia. She learned languages with amazing facility; and understood Polish, German, French, Italian, Latin, Greek, and Hebrew. She attained a knowledge of the sciences with equal ease: she was skilled in history, physic, poetry, painting, music, and playing upon instruments; yet these were her amusements only. She more particularly applied herself to the mathematics, and especially to astronomy, which she made her principal study, and was ranked in the number of the most able astronomers of her time. Her Astronomical Tables acquired her a prodigious reputation: she printed them in Latin and German, and dedicated them to the emperor Ferdinand III. She married Elias de Lewin, M. D.; and died at Pistehen, in 1664.

CUNNINGHAM, ALEXANDER, a Scotch writer, was born at Etrick, near Selkirk, in 1654, and educated in Holland, from whence he came to England with the prince of Orange. He became travelling tutor to several noblemen and gentlemen; by which means he obtained the appointment of resident envoy at Venice, where he continued five years. He died in London in 1737. In 1787 appeared his "History of Great Britain, from the Revolution to the Accession of George I." two vols. translated from the Latin MS. by Dr. William Thompson. There was one Alexander Cunningham who published an edition of Horace at the Hague, in two vols. 8vo. 1721, which is held in great esteem. It is not certain whether he be the same person with the preceding or not; but the particulars in the characters are so much alike that it seems probable he was the same person.

CUNNINGHAMIA, in botany, a genus of the tetrandria monogynia class and order. Calyx very small, four-toothed; corolla four-cleft, with a short tube; berry crowned with a two-celled two-seeded nut. One species, viz. *C. sarmentosa*.

CUNOCEPHALI, in mythology, [from *κυν*, dog, and *κεφαλη*, head,] a kind of baboons, or animals with heads like those of dogs, which were wonderfully endowed, and were preserved with great veneration by the Egyptians in many of their temples. It is related, that by their assistance the Egyptians found out the particular periods of the sun and moon; and that one-half of the animal was often buried, while the other half survived; and that they could read and write. This strange history, Dr. Bryant imagines, relates to the priests of Egypt, styled *cahen*, to the novices in their temples, and to the examinations they were obliged to undergo, before they could be admitted to the priesthood.

CUNONIA, in botany, a genus of the digynia order, and decandria class. Corolla pentapetalous; calyx pentaphyllous; capsule bilocular, acuminate, polyspermous; styles longer than the flower. One species, a Cape plant.

CUP GALLS, in natural history, a name given to a curious kind of galls found on the leaves of the oak, and some other trees. They derive their name from their shape being that of a cup. The oak leaves furnish us with several other species, of various shapes and sizes, which appear on the leaves at different seasons of the year. They all contain the worm of some small fly, that passes through all its changes in this habitation, being sometimes found in the worm, sometimes in the nymph, and sometimes in the fly state, in the cavity.

CUP, in botany, calyx. See **BOTANY**.

CUPANIA, in botany, a genus of the monadelphia order, and monœcia class; natural order, Tricocœæ. Calyx of the male triphyllous; corolla pentapetalous; stamina five: calyx of the female triphyllous; corolla tripetalous; style trifid; seeds two. It has two species, natives of the West Indies.

CUPAR, a town of Scotland, seven miles S. of Dundee.

CUPEL, in metallurgy, a small vessel, which absorbs metallic bodies when changed by fire into a fluid scoria; but retains them as long as they continue in their metallic state. One of the most proper materials for making a vessel of this kind is the ashes of animal bones; there is scarcely any other substance which so strongly resists vehement fire, which so readily imbibes metallic scoriae, and which is so little disposed to be vitrified by them. Instead of these, some use vegetable ashes, freed by boiling in water from their saline matter, which would cause them to melt in the fire. The bones burnt to perfect whiteness, so that no particle of coaly or inflammable matter may remain in them, and well washed from filth, are ground into moderately fine powder; which, to form into cupels, is moistened with just as much water as is sufficient to make it hold together, when strongly pressed between the fingers.

Some mix glutinous liquids, as whites of eggs or gum water, to give the powder a great tenacity: but the inflammable matter, however small in quantity, which accompanies these fluids, and cannot be easily burnt out from the internal part of the mass, is apt to revive a part of the metallic scoria that has been absorbed, and to occasion the vessel to burst or crack. The cupel is formed in a brass ring, from three quarters of an inch to two inches diameter, and not quite so deep, placed upon some smooth support: the ring being filled with moistened powder, which is pressed close with the fingers; a round faced pestle, called a monk, is struck down into it with blows of a mallet, by which the mass is made to cohere, and rendered sufficiently compact, and a shallow cavity is formed in the middle. The figure of the cavity is nearly spherical, that a small quantity of metal melted in it may run together into a bead. To make the cavity the smoother, a little of the same ashes levigated into an impalpable powder, and not moistened, is commonly sprinkled on the surface, through a small fine sieve made for this purpose, and the monk again struck down upon it. The ring or mould is a little narrower at bottom than at top: so that by pressing it down on some of the dry powder spread upon a table, the cupel is loosened, and forced upwards a little; after which it is easily pushed out with the finger, and is then set to dry in a warm place free from dust.

CUPELLATION, the act of refining gold or silver by means of a cupel. For this purpose another vessel, called a muffle, is made use of, within which one or more cupels are placed. The muffle is placed upon a grate in a proper furnace, with its mouth facing the door, and as close as it may be. The furnace being filled up with fuel, some lighted charcoal is thrown on the top, and what fuel is afterwards necessary is supplied through a door above. The cupels are set in the muffle; and being gradually heated by the successive kindling of the fuel, they are kept red-hot for some time, that the moisture which they strongly retain may be completely dissipated: for if any vapours should issue from them after the metal is put in, they would occasion it to sputter, and a part of it to be thrown off in little drops. In the sides of the muffle are some perpendicular slits, with a knob over the top of each, to prevent any small pieces of coals or ashes from falling in. The door, or some apertures made in it being kept open, for the inspection of the cupels, fresh air enters into the muffle, and passes off through these slits: by laying some burning charcoal on an iron plate before the door, the air is heated before its admission; and by removing the charcoal or supplying more, the heat in the cavity of the muffle may be somewhat diminished or increased more speedily than can be effected by suppressing or exciting the fire in the furnace on the outside of the muffle. The renewal of the air also is necessary for promoting the scorification of the lead. The cupel being of a full red heat, the lead cast into a smooth bullet, that it may not scratch or injure the surface, is laid lightly in the cavity: it immediately melts; and then the gold or silver to be cupelled is cautiously introduced either by means of a small iron ladle or by wrapping them in paper, and dropping them on the lead with a pair of tongs. The quantity of lead should be at least three or four times that of the gold or silver: but when gold is very impure, it requires 10 or 12 times its quantity of lead for cupellation. It is reckoned that copper requires for its scorification about 10 times its weight of lead; that when copper and gold are mixed in equal quantities, the copper is so much defended by the gold as not to be separable with less than 20 times its weight of lead; and that when copper is in very small proportion, as a 20th or 30th part of the gold or silver, upwards of 60 parts of lead are necessary for one of the copper. The cupel must always weigh at least half as much as the lead and copper; for otherwise it will not be sufficient for receiving half the scoria: there is little danger, however, of cupels being made too small for the quantity of a gold assay. The mixture being brought into thin fusion, the heat is to be regulated according to the appearances; and in this consists the principal nicety in the operation. If a various coloured skin rises to the top, which, liquifying, runs off to the sides, and is there absorbed by the cupel, visibly staining the parts it enters; if a fresh scoria continually succeeds, and is absorbed nearly as fast as it is formed, only a fine circle of it remaining round the edge of the metal; if the lead appears in gentle motion, and throws up a fume a little way from its surface; the fire is of the proper degree, and the process goes on successfully. Such a fiery brightness of the cupel as prevents its colour from being distinguished

guished, and the fumes of the lead rising up almost to the arch of the muffle, are marks of too strong a heat: though it must be observed, that the elevation of the fumes is not always in proportion to the degree of heat; for if the heat greatly exceeds the due limits, both the fumes and ebullition will entirely cease. In these circumstances the fire must necessarily be diminished: for while the lead boils and smokes vehemently, its fumes are apt to carry off some part of the gold; the cupel is liable to crack from the hasty absorption of the scoria, and part of the gold and silver is divided into globules, which lying discontinued on the cupel after the process is finished, cannot easily be collected: if there is no ebullition or fumes, the scorification does not appear to go on. Too weak a heat is known by the dull redness of the cupel; by the fume not rising from the surface of the lead; and the scoria like bright drops in languid motion, or accumulated, or growing all over the metal. The form of the surface affords also an useful mark of the degree of heat; the stronger the fire, the more convex is the surface; and the weaker, the more flat: in this point, however, regard must be had to the quantity of metal; a large quantity being always flatter than a small one in an equal fire. Towards the end of the process, the fire must be increased; for the greatest part of the lead being now worked off, the gold and silver will not continue melted in the heat that was sufficient before. As the last remains of the lead are separating, the rainbow colours on the surface become more vivid, and variously intersect one another with quick motions. Soon after, disappearing all at once, a sudden luminous brightness of the button of gold or silver shews the process to be finished. The cupel is then drawn forwards towards the mouth of the muffle; and the button, as soon as grown fully solid, taken out.

CUPHEA, in botany, a genus of the dodecandria monogynia class and order. Calyx six-toothed, unequal; petals six, unequal; inserted into the calyx; capsule one-celled, with a three-sided follicle. There is but one species.

CUPID, in pagan mythology, the god of love. There were two cupids; one the son of Jupiter and Venus, whose delight it was to raise sentiments of love and virtue; and the other the son of Mars and the same goddess, who inspired base and impure desires. The first of these, called Eros, or true love, bore golden arrows, which caused real joy, and a virtuous affection; the other called Anteros, had leaden arrows that raised a passion founded only on desire, which ended in satiety and disgust. Cupid was always drawn with wings, to represent his inconstancy; and naked, to shew that he has nothing of his own.

CUPOLA, in architecture, a spherical vault; or the round top of the dome of a church, in form of a cup inverted. See **DOME**, and Plate LIV. fig. 4.

CUPPING, in surgery, the operation of applying cupping-glasses for the discharge of blood and other humours by the skin. See **SURGERY**.

CUPRESSUS, the **CYPRESS TREE**: a genus of the monadelphia order, and monœcia class of plants; natural order, Coniferae. Male calyx, a scale of the catkin; no corolla; anthera four, sessile, and without filaments: calyx of the female a scale of the strobilus, uniflorous; instead of styles there are hollow dots; fruit an angulated nut. There are seven species.

C. DISTICHA, the **DECIDUOUS AMERICAN CYPRESS**, has an erect trunk, retaining a large bulk, branching wide and regular; grows 50 or 60 feet high, fully garnished with small spreading deciduous leaves, arranged distichous, or along two sides of the branches. All these species are raised from seeds, and will sometimes also grow from cuttings; but those raised from seeds prove the hand-somest plants.

C. SEMPERVIRENS, with an upright straight stem, closely branching all around, almost from the bottom upwards, into numerous quadrangular branches; rising in the different varieties from 15 to 40 or 50 feet in height, and very closely garnished with small, narrow, erect, ever-green leaves, placed imbricatum; and flowers and fruit from the sides of the branches. The wood of this species is said to resist worms, moths, and putrefaction, and to last many centuries. The coffins in which the Athenians were wont to bury their heroes were made, says Thucydides, of this wood; as were likewise the chests containing the Egyptian mummies. The doors of St. Peter's church at Rome were originally of it. These, after lasting upwards of 600 years, at the end of which they did not discover the smallest tendency to corruption,

were removed by pope Eugenius IV. and the gates of brass substituted in their place. Cypress, says Mr. Pococke, is the only tree that grows towards the top of mount Lebanon, and being nipped by the cold, grows like a small oak. Noah's ark is commonly supposed to have been made of this kind of wood.

C. THYOIDES, the evergreen American cypress, commonly called white cedar, hath an upright stem, branching out into numerous two-edged branches, rising 20 or 30 feet high, ornamented with flat ever-green leaves imbricated like arbor vita, and small blue cones the size of juniper berries.

CUPRIUM, copper. See **COPPER**.

CURACOA, **CURASSOU**, or **QUERISOA**, an island in the West Indies, 9 or 10 leagues N. E. from Cape Roman, on the continent of Terra Firma. Lon. 68. 20. W. Lat. 11. 56. N.

CURATE the lowest degree in the church of England; he who represents the incumbent of a church, parson or vicar, and officiates divine service in his stead. In cases of pluralities of livings, or where a clergyman is old and infirm, a curate is requisite to perform the cure of the church. He is to be licensed and admitted by the bishop of the diocese, or by an ordinary having episcopal jurisdiction: and when he has the approbation of the bishop, he usually appoints the salary too; and in such case, if he be not paid, the curate has a proper remedy in the ecclesiastical court, by a sequestration of the profits of the benefice; but if the curate is not licensed by the bishop, he is put to his remedy at common law, where he must prove the agreement, &c.

CURATELLA, in botany, a genus of the digynia order, and polyandria class. Calyx pentaphyllous; petals four; styles two; capsule bipartite, with the cells dispermous.

CURATOR, in Roman antiquity, an officer under the emperors, who regulated the prices of all kinds of merchandise, and vendible commodities in the cities of the empire. They had likewise the superintendence of the customs and tributes; whence also they were called *Logistæ*.

CURATOR, in the civil law, a trustee nominated to take care of the affairs of a person emancipated or interdicted. In countries where the Roman law prevails, between the age of 14 and 24 years, minors have curators assigned them; till 14, they have tutors.

CURATOR OF AN UNIVERSITY, in the ci-devant United Provinces, an officer that had the direction of the affairs of the university, such as the superintendence of the professors, the management of the revenues, &c. these officers, being elective, were chosen by the states of each province. Leyden had three curators.

CURB, in the manege, a chain of iron, made fast to the upper part of the branches of the bridle, in a hole, called the eye, and running over the horse's beard.

CURCULIGO, in botany, a genus of the polygamia monœcia class and order. Calyx none; corolla six-petaled; filaments six; pistil one; capsule; seeds beaked. One species, viz. *C. orchiodes*, native of shady, uncultivated places about Samulcotah.

CURCULIO, **WEEVIL**, in natural history, a genus of insects of the order coleoptera: antennæ clavate, seated on the snout, which is horny and prominent; four feelers, filiform. It has from 800 to 1000 species. These have been separated into three sections, viz. A. jaw cylindrical, one-toothed. B. lip bifid; jaw bifid, short; snout short. C. lip rounded, horny; feelers very short. Of these the section A. is distinguished into *a*, snout longer than the thorax; thighs unarmed; *b*, snout longer than the thorax; thighs toothed; *c*, snout longer than the thorax; hind thighs formed for leaping; *d*, snout shorter than the thorax; thighs unarmed; *e*, snout shorter than the thorax; thighs toothed.

C. IMPERIALIS, or a **DIAMOND BEETLE**, is represented in Plate XXXVII. The larvæ of the curculiones differ not from those of most coleopterous insects. They bear a resemblance to oblong soft worms. They are provided anteriorly with six scaly legs, and their head is likewise scaly. But the places where those larvæ dwell, and their transformations, afford some singularities. Some species of them, that are dreaded for the mischief they do in granaries, find means to introduce themselves, while yet small, into grains of corn, and there make their abode. It is very difficult to discover them, as they lie concealed within the grain. There they grow at leisure, enlarging their dwelling places as they grow, at the expence of the interior meal of the grain on which they feed. Corn-lofts are often laid waste by these insects, whose numbers are sometimes so great as to devour and destroy all the corn. When the insect, after having eat up the meal, is come to

its full size, it remains within the grain, hidden under the empty husk, which subsists alone; and there transformed, it becomes a chrysalis, nor does it leave it till a perfect insect, making its way through the husk of the grain. It is no easy matter to discover by the eye the grains of corn thus attacked and hollowed out by these insects, as they outwardly appear large and full; but the condition the curculio has reduced them to, renders them much lighter; and on throwing corn infested by these insects into water, all the tainted grains will swim, and the rest sink to the bottom. Other larvæ of curculiones are not so fond of corn, but fix in the same manner on several other seeds. Beans, pease, and lentils, that are preserved dry, are liable to be spoiled by these little animals, which prey upon the inward part of the grain, where they have taken up their habitation, and do not come forth till they have completed their transformation, by breaking through the outward husk of the grain; this is discoverable by casting those grains into water; those that swim are generally perforated by the curculiones. Other species are lodged in the inside of plants. The heads of artichokes and thistles are often bored through and eaten away by the larvæ of large curculiones. Another species smaller, but singular, pierces and inwardly consumes the leaves of elms. It frequently happens that almost all the leaves of an elm appear yellow, and as it were dead towards one of their edges, while the whole remainder of the leaf is green. Upon inspecting those leaves, the dead part appears to form a kind of bag or small bladder. The two laminae or outward pellicles of the leaf, as well above as below, are entire, but distant and separated from each other, whilst the parenchyma that lies between them has been consumed by several small larvæ of the curculio, that have made themselves that dwelling, in which they may be met with. After this transformation they come forth, by piercing the kind of bladder, and give being to a curculio that is brown, small, and hard to catch, by reason of the nimbleness with which it leaps. The property of leaping, allotted to this single species, depends on the shape and length of its hinder legs.

CURCUMA, TURMERIC: a genus of the monogynia order, and monandria class of plants; natural order, Scitamineæ. Stamina four, barren, a fifth fertile; corolla four-parted; nectary three-lobed; filament flat. There are three species, of which *C. rotundo*, round-rooted turmeric has a perennial root, with a large ovate bulb, frequently as big as a goose's egg, covered with a thin pellicle, that has parallel rooting rings within, solid, fleshy, reddish yellow, of a bitterish taste, and slightly aromatic smell. Native of the East Indies, China, &c.

CURDISTAN, a country of Asia, seated between the Turkish empire and Persia, lying along the E. coast of the Tigris, and comprehending great part of the ancient Assyria.

CURDLING, the coagulating or fixing of any fluid body; particularly milk. See **CHEESE**. Pausanias says, that Aristæus son of Apollo, and Cyrene daughter of the river Peneus, were the first who found the art of curdling milk.

CURETES, ancient Cretan priests, called also Corybantes.

CURFEW, a signal given in cities, taken in war, &c. to the inhabitants to go to bed, and to advertise the people to secure themselves from the robberies and debaucheries of the night. The most eminent curfew in England, was that established by William the Conqueror, who appointed, under severe penalties, that, at the ringing of a bell, at eight o'clock in the evening, every one should put out their lights and fires, and go to bed: whence to this day, a bell rung about that time, is called a curfew-bell.

CURIA, among the ancient Romans, denoted a portion or division of a tribe. In the time of Romulus, a tribe consisted of ten curiæ, or 1000 men; each curia being 100. The legislator made the first division of his people into thirty curiæ. Afterwards, curia became used for the place where each curia held its assemblies as well as for the senate-house, and hence the moderns use the word curia, a court, for a place of justice, and for the judges, &c. there assembled. Varro derives the word from *cura*, care; *q. d.* an assembly of people charged with the care of public affairs. Others deduce it from the Greek; maintaining, that at Athens they called *xylia* the place where the magistrate held his assizes, and the people used to assemble; *xylia*, again, may come from *xylæ*, authority, or power; because here the laws were made.

CURIA CLAUDENDA, in law, is a writ that lies against him who should fence and inclose the ground, but refuses or defers to do it.

CURIA MARIA, an island in the Arabian sea, near the S. E. coast of Arabia, 40 miles long, and 16 broad.

CURACO, a bay in Terra Firma, S. America, on the North Sea.

CURING, a term used for the preserving of fish, flesh, and other animal substances, by means of certain additions of things, to prevent putrefaction. One method of doing this, is by smoaking the bodies with the smoke of wood; another and the chief one, is by rubbing them with salt, nitre, &c.

CURIO, the chief and priest of a curia. Romulus, upon dividing the people into curiæ, gave each division a chief, who was to be priest of that curia, under the title of curio and flamen curialis. His business was to provide and officiate at the sacrifices of the curia, which were called curionia.

CURRENT is a term used to express the present time: thus, the year 1810 is the current year; the 20th current is the 20th day of the present month. The price current is the known and ordinary price accustomed to be given for it. As applied to commerce, we say, "current coin," for the known and common coin of the country.

CURIOSUS, [from *cura*, care, Lat.] an officer of the Roman empire during the middle age, appointed to take care that no frauds and irregularities were committed; particularly in what related to the posts, the roads, &c.

CURRANS, or **CURRANTS**. See **RISES**.

CURRENTS also signify a smaller kind of grapes brought principally from Zante and Cephalonia. They are opening and peccol, but are more used in the kitchen than in medicine.

CURRENTS, in navigation, are certain settings of the stream, by which ships are compelled to alter their course or velocity, or both, and submit to the motion impressed upon them by the current. See **NAVIGATION**.

CURRENT ISLAND, a small island in the Pacific ocean. Lon. 134. 3. E. Lat. 4. 40. N.

CURRICULUS, in our ancient writers, denotes the year or course of a year.

CURRITUCK, a county of N. Carolina, on the sea-coast of Edenton district.

CURRODREPANUS, [from *currus*, a chariot, and *δρέπανον*, a scythe,] in antiquity, a chariot armed with scythes. The driver of these chariots was obliged to ride on one of the horses, as there was no other seat for him; the usual place for him being all armed with knives, as was likewise the hinder part of the chariot. There were no scythes pointing down to the earth either from the beam or axle-tree; but these were fixed on the axle-tree, so as to be moveable by means of a rope, and thereby could be raised or let down, and drawn forward or let fall backward, by relaxing the rope.

CURRYING, the method of preparing leather with oil, tallow, &c. The chief business is to soften and supple cow and calveskins, which make the upper-leathers and quarters of shoes, covering of saddles, coaches, and other things which must keep out water. 1. These skins, after coming from the tanner's yard, having many fleshy fibres on them, the currier soaks them some time in common water. 2. He takes them out and stretches on a very even wooden horse; then with a paring knife he scrapes off all the superfluous flesh, and puts them in to soak again. 3. He puts them wet on a hurdle, and tramples them with his heels till they begin to grow soft and pliant. 4. He soaks thereon train oil, which by its unctuous quality, is the best liquor for this purpose. 5. He spreads them on large tables, and fastens them at the ends. There with the help of an instrument, called a pummel, which is a thick piece of wood, the under side of which is full of furrows crossing each other, he folds, squares, and moves them forwards and backwards several times, under the teeth of this instrument, which breaks their too great stiffness. This is what is properly called currying. The order and number of these operations is varied by different curriers, but the material part is always the same. 6. After the skins are curried, there may be occasion to colour them. The colours most in use are black, white, red, yellow, green, &c. the other colours are given by the skimmers, who differ from curriers in this, that they apply their colours on the flesh side; the curriers on the hair side. In order to whiten skins, they are rubbed with lumps of chalk or white lead, and afterwards with pumice-stone. 7. When a skin is to be made black, after having oiled and dried it, he passes over it a puff dipt in water impregnated with iron; and after his first wetting, he gives it another in a water prepared with soot, vinegar, and gum-arabic. These

These different dyes gradually turn the skin black, and the operations are repeated till it be of a shining black. The grain and wrinkles, which contribute to the suppleness of calves and cows leather are made by the reiterated folds given to the skin in every direction, and by the care taken to scrape off all hard parts on the colour side.

CURSITOR, [Latin,] an officer or clerk belonging to the Chancery. Of these there are twenty-four in number, which have certain shires allotted to each of them, into which they make out such original writs as are required. They are a corporation among themselves.

CURSOLIERS, a small island of Greece, in the gulf of Patras, anciently called Echanades.

CURSOR, in mathematical instruments, is any small piece that slides: as the piece in an equinoctial ring-dial that slides to the day of the month; the little label of brass divided like a line of sines, and sliding in a groove along the middle of another label, representing the horizon in the analemma; and likewise a brass point screwed on the beam-compasses, which may be moved along the beam for the striking of greater or less circles.

CURTATE DISTANCE, in astronomy, the distance of a planet from the sun to that point where a perpendicular let fall from the planet meets with the ecliptic.

CURTEYN, **CURTANA**, in the British customs, king Edward the Confessor's sword, borne before the prince at coronations. Its point is said to be broken off, as an emblem of mercy.

CURTIN, **CURTAIN**, or **COURTIN**, in fortification, is that part of the rampart of a place which is betwixt the flanks of two bastions bordered with a parapet five feet high, behind which the soldiers stand to fire upon the covered way, and into the moat. See **FORTIFICATION**.

CURTISIA, in botany, a genus of the tetrandria monogynia class and order. Calyx four-parted; petals four; drupe superior, roundish, succulent, with a four or five-celled nut. It has one species, viz. *C. faginea*, beech-leaved curtisia, or hassagay-tree. This is one of the largest trees in the African woods, with very diminutive flowers. The Hottentots and Caffres make the shafts of their javelins, or assagays, from the wood of this tree.

CURTIUS, **QUINTUS**, a Latin historian, who wrote the life of Alexander the Great in ten books, of which the two first are not extant, but are so well supplied by Freinshemius, that the loss is scarcely regretted. Where this writer was born, or even when he lived, is not known. By his style he is supposed to have lived near the Augustan age; though some imagine the work to have been composed in Italy about 300 years ago, and the name of Quintus Curtius fictitiously prefixed. Cardinal de Perron was so great an admirer of this work, as to declare one page of it to be worth 30 of Tacitus's; yet M. le Clerc, at the end of his *Art of Criticism*, has charged the writer with great ignorance and many contradictions. He has nevertheless many qualities as a writer, which will always make him admired and applauded.

CURVATURE OF A LINE, is the peculiar manner of its bending or flexure, by which it becomes a curve of such and such peculiar properties. Any two arches of curve lines touch each other when the same right line is the tangent of both at the same point; but when they are applied upon each other in this manner, they never perfectly coincide, unless they are similar arches of equal and similar figures; and the curvature of lines admits of indefinite variety. Because the curvature is uniform in a given circle, and may be varied at pleasure in them by enlarging and diminishing their diameters, the curvature of circles serves for measuring that of other lines. Of all the circles that touch a curve in any given point, that is said to have the same curvature with it, which touches it so closely, that no circle can be drawn through the point of contact between them: and this circle is called the circle of curvature; its centre the centre of curvature; and its semi-diameter, the radius of curvature belonging to the point of contact. As in all figures, rectilinear ones excepted, the position of the tangent is continually varying, so the curvature is continually varying in all curvilinear figures, the circle only excepted. As the curve is separated from its tangent by its curvature, so it is separated from the circle of curvature in consequence of the increase or decrease of its curvature; and its curvature is greater or less, according as it is more or less inflected from the tangent, so the variation of curvature is greater or less, according as it is more or less separated from the circle of curvature. When any two curve lines touch each other in such a manner that no circle can pass between them, they

must have the same curvature; for the circle that touches the one so closely that no circle can pass between them, must touch the other in the same manner. And it can be made appear, that circles may touch curve lines in this manner; that there may be indefinite degrees of more or less intimate contact between the curve and the circle of curvature; and that a conic section may be described that shall have the same curvature with a given line at a given point, and the same variation of a curvature, or a contact of the same kind with the circle of curvature. The rays of curvature of similar arcs, in similar figures, are in the same ratio as any homologous lines of these figures, and the variation of curvature is the same.

CURVE, in geometry, a line which, running on continually in different directions, may be cut by a right line in more points than one. In a curve, the line *AD*, (See Plate LI. fig. 3,) which bisects all the parallel lines *MN*, is called a diameter, and the point *A*, where the diameter meets the curve, is called the vertex of the diameter; if *AD* bisect all the parallels at right angles, it is called the axis. The parallel lines *MN* are called ordinates, or applicates, and their halves, *PM*, or *PN*, semi-ordinates. The portion of the diameter *AP*, between the vertex, or any other fixed point, and an ordinate, is called the absciss; also the concurrence of all the diameters, if they meet all in one point, is the centre. This definition of the diameter, as bisecting the parallel ordinates, respects only the conic sections, or such curves as are cut only in two points by the ordinates; but in the lines of the third order, which may be cut in three points by the ordinates, then the diameter is that which cuts the ordinate so, that the sum of the two parts that lie on the one side of it, shall be equal to the part on the other side; and so on for curves of higher orders; the sum of the parts of the ordinates on one side of the diameter, being always equal to the sum of the parts on the other side of it. A line which meets the curve, and does not cut it, is called a tangent. Curve lines are distinguished into algebraical or geometrical, and transcendental or mechanical. Algebraical or geometrical curves are those in which the relation of the absciss *AP*, to the ordinates *PM*, can be expressed by a common algebraic equation. And transcendental or mechanical curves are such as cannot be so defined or expressed by an algebraical equation. Thus suppose, for instance, the curve be the circle (fig. 4,) and that the radius *AC* = *r*, the absciss *AP* = *x*, and the ordinate *PM* = *y*; then, because the nature of the circle is such, that the rectangle *AP* × *PB* is always = *PM*², therefore *x* · *2r* - *x* = *y*², or *2rx* - *x*² = *y*², is the equation, defining this curve, which is therefore an algebraical or geometrical line. Or suppose *CP* = *x*, then is *CM*² - *CP*² = *PM*², that is, *r*² - *x*² = *y*²; which is another form of the equation of the curve. The doctrine of curve lines in general, as expressed by algebraical equations, was first introduced by Des Cartes, who called algebraical curves geometrical ones, as admitting none else into the construction of problems, nor consequently into geometry. But Newton, Leibnitz, and Wolfius, think that in the construction of a problem, one curve is not to be preferred to another for its being defined by a more simple equation, but for its being more easily described. Algebraical or geometrical lines are best distinguished into orders according to the number of dimensions of the equation expressing the relation between its ordinates and absciss, or, which is the same thing, according to the number of points in which they may be cut by a right line. And curves of the same kind or order are those whose equations rise to the same dimension. Hence of the first order, there is the right line only; of the second order of lines, or the first order of curves, are the circle and conic sections, being four species only, viz. $dx - x^2 = y^2$ the circle, $\frac{c^2}{d^2} \cdot dx - x^2 = y^2$ the ellipse, $-\frac{c^2}{d^2} \cdot dx + x^2 = y^2$ the hyperbola, and $dx = y^2$ the parabola; the lines of the third order, or curves of the second order, are expressed by an equation of the third degree, having three roots; and so on. Of these lines of the third order, Newton wrote an express treatise, under the title of "Enumeratio Linearum Tertii Ordinis," shewing their distinctive characters and properties, to the number of seventy-two different species of curves; but Mr. Stirling afterwards added four more to that number, and Mr. Nic. Bernoulli and Mr. Stone added two more. As to the curves of the second orders, Sir Isaac Newton observes, they have parts and properties similar to those of the first: thus, as the conic sections have diameters and axes, the lines

cut by these are called ordinates, and the intersection of the curve and diameter, the vertex. So in curves of the second order, any two parallel lines being drawn so as to meet the curve in three points, a right line cutting these parallels, so as that the sum of the two parts between the secant and the curve on one side, is equal to the third part terminated by the curve on the other side, will cut in the same manner all other right lines parallel to these, and meet the curve in three parts, so as that the sum of the two parts on one side will be still equal to the third part on the other side. These three parts, therefore, thus equal, may be called ordinates or applicates; the second may be styled the diameter; the intersection of the diameter and the curve the vertex; and the point of concurrence of any two diameters the centre. And if the diameter be normal to the ordinates, it may be called axis; and that point where all the diameters terminate, the general centre. Again, as an hyperbola of the first order has two asymptotes, that of the second three, that of the third four, &c. and as the parts of any right line lying between the conic hyperbola and its true asymptote are every where equal, so in the hyperbola of the second order, if any right line be drawn, cutting both the curve and its three asymptotes in three points, the sum of the two parts of that right line being drawn the same way from any two asymptotes to two points of the curve, will be equal to a third part drawn a contrary way from the third asymptote to a third point of the curve. Again, as in conic sections not parabolical, the square of the ordinate, that is, the rectangle under the ordinates drawn to contrary sides of the diameter, is to the rectangle of the parts of the diameter which are terminated at the vertices of the ellipsis or hyperbola, as the latus rectum is to the latus transversum; so in nonparabolic curves of the second order, a parallelopiped under the three ordinates is to a parallelopiped under the parts of the diameter, terminated at the ordinates, and the three vertices of the figure, in a certain given ratio; in which ratio, if you take three right lines situated at the three parts of the diameter between the vertices of the figure, one answering to another, then these three light lines may be called the latera recta of the figure, and the parts of the diameter between the vertices, the latera transversa. And, as in the conic parabola, having to one and the same diameter but one only vertex, the rectangle under the ordinates is equal to that under the part of the diameter cut off between the ordinates and the vertex, and the latus rectum; so in curves of the second order, which have but two vertices to the same diameter, the parallelopiped under three ordinates, is equal to the parallelopiped under the two parts of the diameter cut off between the ordinates and those two vertices and a given right line, which therefore may be called the latus rectum. Moreover, as in the conic sections, when two parallels, terminated on each side of the curve, are cut by two other parallels terminated on each by the curve, the first by the third, and the second by the fourth; as here the rectangle under the parts of the first is to the rectangle under the parts of the third, as the rectangle under the parts of the second, is to that under the parts of the fourth; so when four such right lines occur in a curve of the second kind, each in three points, then shall the parallelopiped under the parts of the first right line, be to that under the parts of the third, as the parallelopiped under the parts of the second line, to that under the parts of the fourth. Lastly, the legs of curves, both of the first, second, and higher kinds, are either of the parabolic or hyperbolic kind; an hyperbolic leg being that which approaches infinitely towards some asymptote; a parabolic, that which has no asymptote. These legs are best distinguished by their tangents; for if the point of contact go off to an infinite distance, the tangent of the hyperbolic leg will coincide with the asymptote; and that of the parabolic leg recede infinitely, and vanish. The asymptote, therefore, of any leg is found by seeking the tangent of that leg to a point infinitely distant; and the bearing of an infinite leg is found by seeking the position of a right line parallel to the tangent, when the point of contact is infinitely remote; for this line tends the same way towards which the infinite leg is directed. For the other properties of curves of the second order, we refer the reader to Mr. Maclaurin's treatise "De Linearum Geometricarum Proprietatibus generalibus." Sir Isaac Newton reduces all curves of the second order to the four following particular equations, still expressing them all. In the first, the relation between the ordinate and the absciss, making the absciss a and the ordinary y , assumes this form, $xy^2 + cy = ax^3 + bx^2 +$

$cx + d$. In the second case, the equation takes this form, $xy = ax^3 + bx^2 + cx + d$. In the third case, the equation is $y^2 = ax^3 + bx^2 + cx + d$. And in the fourth case, the equation is of this form, $y = ax^3 + bx^2 + cx + d$.

CURVES, FAMILY OF, according to Wolfius, is a congeries of several curves of different kinds, all defined by the same equation of an indeterminate degree, but differently, according to the diversity of their kinds. For example: let the equation of an indeter-

minate degree be $x = y^m$. If $m = 2$, ax will be equal to y^2 . If $m = 3$, then will $a^2x = y^3$. If $m = 4$, then will $a^3x = y^4$, &c. all which curves are said to be of the same family. The equations, however, by which the families of curves are defined, must not be confounded with transcendental ones; though with regard to the whole family they be of an indeterminate degree, yet with respect to each several curve of the family, they are determinate; whereas transcendental equations are of an indefinite degree with respect to the same curve. The genesis and properties of particular curves, as the conchoid, cycloid, &c. see under their proper heads CONCHOID, CYCLOID, &c. See also CONIC SECTIONS, GEOMETRY, and EQUATIONS, CONSTRUCTION OF.

CURVET, or CORVET, in the manege, an air in which the horse's legs are raised higher than in the demi-volt; being a kind of leap up, and a little forwards, wherein the horse raises both his fore-legs at once, equally advanced, (when he is going straight forward and not in a circle) and as his fore-legs are falling, he immediately raises his hind-legs, equally advanced, and not one before the other: so that all his four legs are in the air at once; and as he sets them down, he marks but twice with them.

CURULE CHAIR, in Roman antiquity, a chair adorned with ivory, wherein the great magistrates of Rome had a right to sit and be carried.

CURULES, the curule magistrates were the ædiles, the prætors, censors, and consuls.

CURZOLA, an island of Dalmatia, belonging to the emperor, 30 miles long, and 8 broad.

CURZOLA, a town in the E. end of the above island.

CUSCO, the ancient capital of the Peruvian empire in South America, and formerly the residence of the Incas. It is 325 miles E. of Lima.

CUSCOWILLA, an Indian town of East Florida, the capital of the Alachua tribe.

CUSCUTA, DODDER: in botany, a genus of the digynia order, and tetrandria class of plants. Calyx quadrifid; corolla monopetalous; capsule bilocular. Four species; of which *C. Europæa*, dodder, hell-weed, or devil's guts, is a very singular plant, almost destitute of leaves, parasitical, creeping, fixing itself to whatever is next to it. It decays at the root, and afterwards is nourished by the plant which supports it. Hops, flax, and nettles, are its common support; but principally the common nettle.

CUSHION, in engraving, is a bag of leather filled with sand, commonly about nine inches square, and three or four thick, used for supporting the plate to be engraved.

CUSHION, in gilding, is made of leather, fastened to a square board, from 14 inches square to 10, with a handle. The vacuity between the leather and board is stuffed with fine tow or wool, so that the outer surface may be flat and even. It is used for receiving the leaves of gold from the paper, in order to its being cut into proper sizes and figures.

CUSP, [*cuspis*, Lat.] a term used to express the points or horns of the moon, or other luminary.

Cusp, in astrology, is used for the first point of each of the 12 houses, in a figure or scheme of the heavens.

CUSPATED, or CUSPIDATED, [from *cuspis*, Lat.] a word expressing the leaves of a flower ending in a point.

CUSPINIAN, JOHN, a German, born at Schweinfurt, in 1473. He was first physician to the emperor Maximilian I. and employed by him in several negotiations. He wrote in Latin, 1. A history of the Roman emperors from Julius Cæsar to the death of Maximilian I. Degory Wheare, in his *Methodus Legendæ Historiæ*, calls this "luculentum sane opus, et omnium lectione dignissimum." 2. An History of Austria; being a kind of continuation of the preceding. 3. An History of the Origin of the Turks, and of their Cruelties towards Christians. Gerard Vossius calls Cuspinian magnum suo ævo historiæ lumen. He died at Vienna, in 1529.

CUSSET,

CUSSET, a town of France, in the department of Allier, 17 miles N. of Roanne.

CUSSONIA, in botany, a genus of the pentandria digynia class and order: natural order Araliæ. Petals three-cornered; margin of the receptacle dilated into a five-toothed calyx. Two species, viz. *C. thysiflora*, and *C. spicata*, natives of the Cape of Good Hope.

CUSTOM, a very comprehensive term, denoting the manners, ceremonies, and fashions, of a people, which having turned into a habit, and passed into use, obtains the force of laws; in which sense it implies such usages as, though voluntary at first, are yet, by practice, become necessary. Custom is hence, both by lawyers and civilians, defined *lex non scripta*, a law, or right, not written, established by long usage, and the consent of our ancestors; in which sense it stands opposed to the *lex scripta*, or the written law. As no law can bind people without their consent, so, wherever that is had, and a certain rule used as a law, such rule gives it the force of a law; and if it be universal, then it is common law; but if restrained to this or that particular place, it is custom. Custom had its beginning, and received the sanction of the law, thus: when a reasonable act, once done, was found to be beneficial to the people, then they had frequent recourse to it; and by repetitions thereof, it became a custom, which being continued ultra *trivium*, time out of mind, without any interruption, it obtained the power of a law, and binds the places, persons, and things, concerned therein. All customs ought to have a reasonable commencement, be certain, not ambiguous, have uninterrupted continuance, and not be against the King's prerogative: these are incidents inseparable: yet a custom is not unreasonable for being injurious to private persons and interest, so as it tends to the general advantage of the people: but if any custom be contrary to the public good, or if it injures a multitude, and benefits only some certain persons, such a custom is repugnant to the laws of reason, and consequently void. Custom must always be alleged in many persons; and so it may be claimed by copyholders, or the inhabitants of a place, as within such a county, hundred, city, borough, manor, parish, &c. but regularly they shall not allege a custom against a statute: nor may custom be pleaded against custom; though acts of parliament do not always take away the force of customs. The general customs used throughout England being the common law, are to be determined by the judges, who can over-rule a custom that is against natural reason, &c.; but particular customs are determinable by jury. See PRESCRIPTION.

CUSTOM OF LONDON. It is a custom of London, that where a person is educated in one trade, he may set up another; that where a woman uses a trade without her husband, she is chargeable alone, as a femme sole merchant, and, if condemned, shall be put in prison till she pays the debt; likewise the bail for her are liable if she absent herself, and the husband, in these cases, shall not be charged. If a debtor be a fugitive, by the custom of London he may be arrested before the day, in order to find better security, &c. These are customs of this city, different from those of other places.

CUSTOM OF MERCHANTS. If a merchant give a character of a stranger to one who sells him goods, he may be obliged to satisfy the debt of the stranger for the goods sold, by the custom of merchants. And when two persons are found in arrears, upon an account grounded on the custom of merchants, either of them may be charged to pay the whole sum due, &c.

CUSTOM AND HABIT, in the human economy, are often confounded. By custom we mean a frequent reiteration of the same act: and by habit, the effect that custom has on the mind or body. See HABIT.

CUSTOMS. In political economy, the duties, toll, tribute, or tariff, payable to the king upon merchandize exported and imported, form a branch of the perpetual taxes. See TAX. The consideration upon which this revenue (or the more ancient part of it, which arose only from exports) was invested in the king, were said to be two: 1. Because he gave the subject leave to depart the kingdom, and to carry his goods along with him. 2. Because the king was bound of common right to maintain and keep up the ports and havens, and to protect the merchant from pirates. Some have imagined they are called with us customs, because they were the inheritance of the king by immemorial usage and the common law, and not granted by any statute: but Sir Edward Coke hath clearly shewn, that the king's first claim to them was by grant of parliament 3 Edw. I. And indeed this is in express words con-

fessed by statute 25 Edw. I. c. 7. wherein the king promises to take no customs from merchants, without the common assent of the realm, "saving to us and our heirs the customs on wool, skins, and leather, formerly granted to us by the commonalty aforesaid." These were formerly called hereditary customs of the crown; and were due on the exportation only of the said three commodities, and none other: which were styled the staple commodities of the kingdom, because they were obliged to be brought to those ports where the king's staple was established, in order to be there first rated, and then exported. They were denominated in the barbarous Latin of our ancient records, *custuma*, (an appellation which seems to be derived from the French word *coustum*, or *coûtum*, which signifies toll or tribute, and owes its own etymology to the word *cout*, which signifies price, charge, or, as we have adopted it in English, cost); not *consuetudines*, which is the language of our law whenever it means *in re* usages. The duties on wool, sheep-skins, or wool-fells, and leather, exported, were called *custuma antiqua sive magna*: and were payable by every merchant, as well native as stranger; with this difference, that merchant-strangers paid an additional toll, viz. half as much again as was paid by natives. The *custuma parva et nova* were an impost of 3*d* in the pound, due from merchant strangers only, for all commodities as well imported as exported; which was usually called the alien's duty, and was first granted in 31 Edw. I. But these ancient hereditary customs, especially those on wool and wool-fells, came to be of little account, when the nation became sensible of the advantages of a home manufacture, and prohibited the exportation of wool by statute 11 Edw. III. cap. 1. Other customs payable upon exports and imports were distinguished into subsidies, tonnage, poundage, and other imposts. Subsidies were such as were imposed by parliament upon any of the staple commodities before-mentioned, over and above the *custuma antiqua et magna*: tonnage was a duty upon all wines imported, over and above the prisage and butlerage aforesaid: poundage was a duty imposed ad valorem, at the rate of 12*d*. in the pound, on all other merchandize whatsoever: and the other imposts were such as were occasionally laid on by parliament, as circumstances and times required. These distinctions are now in a manner forgotten, except by the officers immediately concerned in this department; their produce being in effect all blended together, under the one denomination of the customs. By these we understand, at present, a duty or subsidy paid by the merchant at the quay upon all imported as well as exported commodities, by authority of parliament; unless where, for particular national reasons, certain rewards, bounties, or drawbacks, are allowed for particular exports or imports. The customs thus imposed by parliament are chiefly contained in two books of rates, set forth by parliamentary authority; one signed by Sir Harbottle Grimston, speaker of the house of commons in Charles II.'s time; and the other an additional one signed by Sir Spenser Compton, speaker in the reign of George I. to which also subsequent additions have been made. Aliens pay a larger proportion than natural subjects, which is what is now generally understood by the aliens duty; to be exempted from which is one principal cause of the frequent applications to parliament for acts of naturalization. These customs are then a tax immediately paid by the merchant, although ultimately by the consumer. And yet these are the duties felt least by the people; and, if prudently managed, the people hardly consider that they pay them at all. For the merchant is easy, being sensible he does not pay them for himself; and the consumer, who really pays them, confounds them with the price of the commodity: in the same manner as Tacitus observes, that the emperor Nero gained the reputation of abolishing the tax of the sale of slaves, though he only transferred it from the buyer to the seller; so that it was, as he expresses it, *remissum magis specie, quam vi: quia, cum venditor pendere juberetur, in partem pretii emptoribus accrescebat*. But this inconvenience attends it on the other hand, that these imposts, if too heavy, are a cramp upon trade; and especially when the value of the commodity bears little or no proportion to the quantity of the duty imposed. This in consequence gives rise also to smuggling, which then becomes a very lucrative employment: and its natural and most reasonable punishment, viz. confiscation of commodity, is in such cases quite ineffectual; the intrinsic value of the goods, which is all that the smuggler has paid, and therefore all that he can lose, being very inconsiderable when compared with his prospect of advantage in evading the duty.

duty. Recourse must therefore be had to extraordinary punishments to prevent it; perhaps even to capital ones; which destroys all proportion of punishment, and puts murderers upon an equal footing with such as are really guilty of no natural, but merely a positive offence. There is also another ill consequence attending high imposts on merchandize, not frequently considered, but indisputably certain; that the earlier any tax is laid on a commodity, the heavier it falls upon the consumer in the end; for every trader through whose hands it passes must have a profit, not only upon the raw material and his own labour and time in preparing it, but also upon the very tax itself, which he advances to the government; otherwise he loses the use and interest of the money which he so advances. To instance in the article of foreign paper. The merchant pays a duty upon importation, which he does not receive again till he sells the commodity, perhaps at the end of three months. He is therefore equally entitled to a profit upon that duty which he pays at the custom-house, as to a profit upon the original price which he pays to the manufacturer abroad; and considers it accordingly in the price he demands of the stationer. When the stationer sells it again, he requires a profit of the printer or bookseller upon the whole sum advanced by him to the merchants; and the bookseller does not forget to charge the full proportion to the student or ultimate consumer; who therefore does not only pay the original duty, but the profits of these three intermediate traders, who have successively advanced it for him. This might be carried much farther in any mechanical, or more complicated, branch of trade.

CUSTOS, [Lat. *i. e.* a keeper,] is a title of several offices; such as

1. **CUSTOS BREVIUM**, the principal clerk belonging to the court of common pleas, whose business it is to receive and keep all the writs made returnable in that court, filing every return by itself; and, at the end of each term, to receive prothonotaries all the records of the nisi prius, called the postea.

2. **CUSTOS ROTULORUM**, an officer who has the custody of the rolls and records of the sessions of peace, and also of the commission of the peace itself. He is usually a nobleman, and always a justice of the peace, of the quorum, in the county where he is appointed.

3. **CUSTOS SPIRITUALIUM**, he that exercises the spiritual jurisdiction of a diocese, during the vacancy of any see, which, by the canon law, belongs to the dean and chapter; but at present, in England, to the archbishop of the province by prescription.

4. **CUSTOS TEMPORALIUM**, the person to whom a vacant see or abbey was given by the king, as supreme lord. His office was, as steward of the goods and profits, to give an account to the exchequer, who did the like to the exchequer.

To **CUT A FEATHER**, in the sea-language, a phrase applied to a ship that has too broad a bow. In such a case, it is common to say, she will not cut a feather; that is, she will not pass through the water so swift as to make it foam or froth.

To **CUT THE SAIL**, to unfurl it, and let it fall down.

CUTCH, a country of Hindostan; bounded on the E. by Guzerat. The principal towns are Booge-booge and Tahej.

CUTH, or **CUTHAH**, a province of Assyria, which, as some say, lies upon the Araxes, and is the same with Cush; but others take it to be the country which the Greeks called Susiana, and which to this day, says Dr. Wells, is by the inhabitants called Chusistan. Calmet is of opinion that Cuthah and Scythia are the same place, and that the Cuthites who were removed into Samaria by Salmaneser (2 Kings xvii. 24.) came from Cush, or Cuth, mentioned in Gen. ii. They worshipped the idol Nergal. Calmet says, that they came from Cush, or Cutha upon the Araxes; and that their first settlement was in the cities of the Medes, subdued by Salmaneser and the kings of Syria his predecessors. The Scriptures inform us, that the Cuthites, upon their arrival in this new country, continued to worship the gods formerly adored by them beyond the Euphrates.

CUTICLE, [*cuticula*, Lat.] in anatomy, a thin membrane, closely lying upon the skin, or cutis, of which it seems a part, and to which it adheres very firmly, being assisted by the intervention of the corpus reticulare.

CUTIS, [Lat.] the skin, in anatomy, is that strong covering which envelopes the whole external surface of animals. It consists chiefly of a thin white elastic layer on the outside, called the epidermis

or cuticle, and a thicker layer, composed of fibres thickly interwoven, and disposed in different directions, which is the cutis or real skin. The epidermis is that part of the skin which is raised in blisters. It is easily separated from the cutis by maceration in hot water. It is very elastic and insoluble in water and alcohol. The fixed alkalies and lime dissolve it entirely. Mr Hatchett, from many experiments, has shewn that the epidermis resembles albumen in many of its properties, or rather that it is nothing more than a peculiar modification of coagulated albumen. The cutis is a thick dense membrane, composed of fibres interwoven like the texture of a hat. When it is macerated for some hours in water, and agitation and pressure are employed to accelerate the effect, the blood, and all the extraneous matter with which it was loaded, are separated from it, but its texture remains unaltered. On evaporating the water employed, a small quantity of gelatine may be obtained. No subsequent maceration in cold water has any farther effect. When distilled it yields the same products as fabrina. The concentrated alkalies dissolve it, converting it into oil and ammonia. Weak acids soften it, render it transparent, and at last dissolve it. Nitric acid converts it into oxalic acid and fat, while, at the same time, azotic gas and prussic acid are emitted. When heated it contracts, and then swells, exhales a fetid odour, and leaves a dense charcoal, difficult to incinerate. By spontaneous decomposition in water or moist earth, it is converted into a fatty matter, and into ammonia, which compose a kind of soap. When allowed to remain long in water, it softens and putrefies, being converted into a kind of jelly. When long boiled in water it becomes gelatinous, and dissolves completely, constituting a viscid liquor, which by proper evaporation is converted into glue. Hence the cutis of animals is commonly employed in the manufacture of glue. From these facts the cutis appears to be a peculiar modification of gelatine enabled to resist the action of water, partly by the compactness of its texture, and partly by the viscosity of the gelatine of which it is formed; for those skins which dissolve most readily in boiling water afford the worst glue. Mr. Hatchett has observed, that the viscosity of the gelatine obtained from skins is nearly inversely as their flexibility, the supplest hides always yielding the weakest glue; but this glue is very soon obtained from them by hot water. The skin of the eel is very flexible, and affords very readily a great proportion of gelatine. The skin of the shark also readily yields abundance of gelatine; and the same remark applies to the skins of the hare, rabbit, calf, and ox; the difficulty of obtaining the glue and its goodness always increasing with the toughness of the hide. The hide of the rhinoceros, which is exceedingly strong and tough, far surpasses the rest in the difficulty of solution, and in the goodness of its glue. When skins are boiled they gradually swell and assume the appearance of horn, then they dissolve slowly. It is from the skin or cutis of animals that leather is formed; and the goodness of the leather, or at least its strength, depends in some measure on the toughness of the hides. These easily soluble, as seal-skins, afford a weaker leather than those which are more difficultly soluble in water. The process by which the skins of animals are converted into leather is called tanning. See **ANATOMY**, **PHYSIOLOGY**, and **TANNING**.

CUTLER, one who makes or deals in edge tools.

CUTLERY. Though cutlery in the general sense comprises all those articles denominated edge-tools, it is more particularly confined to the manufacture of knives, forks, scissors, penknives, razors, and swords. Damascus was anciently famed for its razors, sabres, and swords. The latter are said to possess all the advantages of flexibility, elasticity, and hardness. These united distinctions are said to have been effected by blending alternate portions of iron and steel, in such a manner, that the softness and tenacity of the former could prevent the breaking of the latter. The Germans, it appears, were early acquainted with the art of making various cutlery. The steel employed by them is immediately made from the crude iron into bars, without requiring afterwards to be converted. Those articles of cutlery not requiring a fine polish, are generally made from blistered steel. Those articles which require the edge to possess great tenacity, when superior hardness is not required, are made from sheer-steel. The finer kinds of cutlery are made from steel which has been in a state of fusion, and which is termed cast steel, no other kinds being susceptible of a fine polish. See **STEEL**.

CUTTACK, or **CATTACK**, a city in the Decan of Hindostan,

dostan, the capital of Orissa, 220 miles S. W. of Calcutta. Lon. 86. 1. E. Lat. 20. 51. N.

CUTTER, in naval affairs, a small vessel, commonly navigated in the channel of England. It is furnished with one mast, and rigged as a sloop. Many of these vessels are used in an illicit trade, and others are employed by government to take them; the latter of which are either under the direction of the admiralty or custom-house. See *PLATE LIV.* fig. 1.

CUTTER OF THE TALLIES, an officer of the Exchequer, whose business is to provide wood for the tallies, to cut or notch the sum paid upon them; and then to cast them into court, to be written upon.

CUTTING, in coinage. When the laminae or plates of the metal, be it gold, silver, or copper, are brought to the thickness of the specie to be coined, pieces are cut out, of the thickness, and nearly of the weight of the intended coin; which are now called planchets, till the king's image hath been stamped upon them. The instrument wherewith they cut, consists of two pieces of steel, very sharp, and placed over one another; the lower a little hollow, representing a mortar, the other a pestle. See *COINAGE*. Medallions, where the relievio is to be great, are not cut, but cast or moulded.

CUTTING is particularly used in heraldry, where the shield is divided into two equal parts, from right to left, parallel to the horizon, or in the fesse-way. The word is also applied to the honourable ordinaries, and even to animals and moveables, when they are divided equally the same way; so, however, as that one moiety is colour, the other metal. The ordinaries are said to be cut, coupéd, when they do not come full to the extremities of the shield.

CUTTING, in painting, the laying of one strong lively colour over another, without any shade or softening. The cutting of colours has always a disagreeable effect.

CUTTING, in surgery, denotes the operation of extracting the stone out of the bladder by the knife.

CUTTING, in the manege, is when the horses feet interfere; or when with the shoe of one foot he beats off the skin from the pastern joint of another foot. This is more frequent in the hind-feet than the fore: the cause is commonly bad shoeing.

CUTTING IN WOOD, a particular kind of sculpture or engraving; denominated from the matter wherein it is employed. It is used for various purposes; as for figured letters, head and tail pieces of books; and even for schemes and other figures, to save the expences of engraving on copper; and for prints and stamps for paper, calicoes, linens, &c. The invention of cutting on wood, as well as that in copper, is ascribed to a goldsmith of Florence; but it is to Albert Durer and Lucas they are both indebted for their perfection. See *ENGRAVING AND PRINTING*. Hugo Da Carpi invented a manner of cutting in wood, by means whereof the prints appeared as if painted in clair-obscur. The art of cutting in wood was certainly carried to a very great pitch above 200 years ago; and might even vie, for beauty and justness, with that of engraving in copper. At present it is perhaps too much neglected, and the application of artists almost wholly employed on copper, as the more easy and promising province. In some respects wooden cuts have the advantage of those in copper; as in figures and devices for books; for they can be printed at the same time and in the same press with the letters; whereas for the other, there is required a particular impression. In the representation of plants and flowers, and in designs for paper hangings, where the outline only is wanted to be printed, in a bold full manner, this method is cheaper and more effectual than the use of copper-plates. The cutters in wood begin with preparing a plank or block of the size and thickness required, and very even and smooth on the side to be cut: for this, they usually take beech, pear-tree, or box; though the latter is the best, as being the closest, and least liable to be worm-eaten. The wood being cut into a proper form and size, should be planed as even and truly as possible: it is then fit to receive the drawing or chalking of the design to be engraved. But the effect may be made more apparent, and the ink, if any be used in drawing, be prevented from running, by spreading thinly on the surface of the wood white lead tempered with water, by grinding with a brush pencil, and afterwards rubbing it well with a fine linen rag whilst it is wet; and when it is dry, brushing off any loose or powdery part with a soft pencil. On this block they

draw their design with a pen or pencil, just as they would have it printed. Those who cannot draw their own design, as there are many who cannot, make use of a design furnished them by another; fastening it upon the block with paste made of flour and water, with a little vinegar or gum tragacanth; the strokes or lines turned towards the wood. When the paper is dry, they wash it gently over with a sponge dipped in water; which done, they take off the paper by little and little, still rubbing it a little first with the tip of the finger; till at length there be nothing left on the block but the strokes of ink that form the design, which mark out so much of the block as is to be spared or left standing. Figures are sometimes cut out of prints, by taking away all the white part or blank paper, and cemented with gum-water to the surface of the wood. The rest they cut off, and take away very curiously with the points of very sharp knives, or little chisels or gravers, according to the bigness or delicacy of the work; for they need no other instruments. It differs from engraving in copper, in that the impression comes off from the prominent parts or strokes left uncut; whereas in the copper-plates, it comes from the channels cut in the metal. The manner of printing with wooden prints is much more expeditious and easy than that with copper-plates, because they require only to be dipped in the printing ink, and impressed on the object in the same manner and with the same apparatus as the letter printing is managed; and for purposes that do not require great correctness, the impression is made by the hand only, a proper handle being fixed to the middle of the print, by which it is first dipped in the ink, spread by means of a brush on a block of proportionable size covered with leather; and then lifted up instantly, and impressed with some little force on the paper which is to receive the impression.

CUTTINGS, or **SLIPS**, in gardening, the branches or sprigs of trees or plants, cut or slipped off to set again; which is done in any moist fine earth. The best season is from August to April; but care is to be taken when it is done, that the sap be not too much in the top, lest the cut die before that part in the earth have root enough to support it: nor must it be too dry or scanty; the sap in the branches assisting it to take root. In providing the cuttings, such branches as have joints, knots, or burrs, are to be cut off two or three inches beneath them, and the leaves to be stripped off so far as they are set in the earth. Small top-branches, of two or three years growth, are fittest for this operation.

CUTTLE FISH. See *SERIA*.

CUTTUPDEA, an island in the north-east part of the bay of Bengal. Lon. 92. 0. E. Lat. 21. 53. N.

CUT-WATER, the sharp part of the head of a ship below the beak; so called because it cuts or divides the water before it comes to the bow, that it may not come too suddenly to the breadth of the ship, which would retard it.

CUZUMEL, an island on the bay of Honduras.

CYANELLA, in botany, a genus of the hexandria monogynia class and order; natural order, Coronariae. Corolla six-petaled; the three lower petals hanging forwards; stamens lower, declined, longer than the rest. Three species, natives of the Cape.

CYATHEA, in botany, a genus of the cryptogamia filices class and order. Fructification in roundish scattered dots, seated on a columnar receptacle, within the calyx-like involucre which opens at top; there are about nine species.

CYATHUS, in botany, a genus of the cryptogamia fungi: fungus campanulate or cylindrical, bearing lentiform capsules within. There are six species.

CYBELE, a name of Cybele; from *κυβηβαν*, because in the celebration of her festivals, men were driven to madness.

CYBELE, in Pagan mythology, the daughter of Coelus and Terra, wife of Saturn, and mother of Jupiter, Neptune, Pluto, &c. She is also called Rhea, Ops, Vesta, Bona Mater, Magna Mater, Berecynthia, Dindymere, &c. and by some is reckoned the same with Ceres; but most mythologists make these two distinct goddesses. In Phrygia the festivals of Cybele were observed with the greatest solemnity. Her priests, called Corybantes, Curetes, Galli, &c. it is said, were not admitted in the service of the goddess without a previous mutilation. In the celebration of the festivals, they imitated the manners of madmen, and filled the air with shrieks and howlings, mixed with the confused noise of drums, tabrets, bucklers, and spears.

CYCAS, in botany, a genus of the dicæcia polyandria class and order;

order; natural order, Palmae. Male, amentum strobile form, with the scales covered every where beneath with pollen. Female, spadix sword-form; germ immersed into the corners of it, solitary; style one; drupe with a woody nut. Two species, viz. *C. circinalis*, broad-leaved cycas, and *C. revoluta*, narrow-leaved cycas. The first is a valuable tree to the inhabitants of India, as it not only furnishes a considerable part of their constant bread, but also supplies them with a large article of trade. See SAGO, and Plate XXXV.

CYCEON, [from *κύνειν*, to mix,] a name given by the ancient poets and physicians to a mixture of meal and water, and sometimes of other ingredients. These constitute the two kinds of cyceon; the coarser being of water and meal alone; the richer and more delicate composed of wine, honey, flour, water, and cheese.

CYCINNIS, a Grecian dance, so called from its supposed inventor, one of the satyrs belonging to Bacchus. It consisted of a combination of grave and gay movements.

CYCLADES, in ancient geography, islands so called, as Pliny informs us, from the *cyclus* or orb in which they lie; beginning from the promontory Geraestum of Euboea, and lying round the island Delos. Strabo recites them after Artemidorus, as follows: Helena, Ceos, Cynthus, Seriphus, Melus, Siphus, Cimolus, Prepesinthus, Olearus, Naxus, Parus, Syrus, Myconus, Tenus, Andros, Gyarus; but he excludes from the number, Prepesinthus, Olearus, and Gyarus.

CYCLADES, GREAT. See HEBRIDES, NEW.

CYCLAMEN, SOWBREAD: a genus of the monogynia order and pentandria class of plants; natural order, Preciae. Corolla verticillated, with the tube very short, and the throat prominent; berry covered with the capsule. There are five species; many beautiful varieties. They are low, herbaceous, flowery perennials of the tuberous-rooted kind, with numerous, angular, heart-shaped, spotted, marbled leaves; and many fleshy foot-stalks six inches high, carrying monopetalous, five-parted, reflexed flowers of various colours. All the varieties are extremely ornamental, and some of the flowers very fragrant. They may be planted in any of the common borders, but require to be sheltered from hard frosts by being covered with mats. They should also have a light dry soil, otherwise their roots are apt to rot. The species are propagated by seeds, and the particular varieties by dividing their roots.

CYCLAS, a genus of testacea of the class of bivalves; shells somewhat transverse, without a fold on the anterior side; exterior ligament recurved; hinge of three teeth; lateral teeth elongated, lamelliform, and let into a groove in the opposite valve. This genus contains seven or eight species, mostly inhabiting fresh water pools. Animal acephalous, with two tubes projecting on one side, and on the other, a foot linguiform, or tongue-shaped. See Plate XXXVII.

CYCLAS, in botany, a genus of the decandria monogynia class and order; natural order, Lomentaceae. Calyx four-parted, spreading, with a short turbinate tube; corolla none; filaments inserted into the neck of the calyx; style flexuose; legume roundish, winged, one-seeded. There are two species, viz. *C. spicata*, and *C. aromatica*, both very tall trees, natives of Guiana.

CYCLE, [*κύκλος*, a circle,] in chronology, a certain period or series of years, which regularly proceed from the first to the last, and then return again to the first, and circulate perpetually. The most considerable cycles are those of the sun, of the moon, and of the Roman indiction. See CHRONOLOGY.

CYCLIDIUM, in natural history, a genus of vermes infusoria. Worm invisible to the naked eye, very simple, pellucid, flat, orbicular, or oval. There are seven species. *C. bulla*; orbicular, transparent; in infusions of hay; pellucid, white, with the edges a little darker; motion slow and circular. *C. milium*; elliptical, transparent; in vegetable infusions; pellucid, crystalline, membranaceous, with a line through the whole length.

CYCLOID, a curve of such importance, that the honour of its invention has been much contested among mathematicians. The French ascribe it to their countryman Roberval; but there is sufficient evidence that he was not the original inventor of it. Torricellius informs us, in a treatise containing a demonstration of one of the properties of this curve, viz. that its area is triple that of the

generating circle, and published in 1644, that this curve was known forty-five years before this period, or in 1599, to his master Galileo, and distinguished by the appellation of Cycloid. Besides, Dr. Wallis has discovered among the mathematical works of Bonvillus, published at several times between the years 1501 and 1510, that this curve had been considered in his time; and he has also found, that it was known to cardinal Cusanus, who gave an account of it in a copy of his works transcribed in 1451. But its various properties have been gradually discovered; and the method of regulating the motion of a pendulum by this curve, was the invention of Huygens in the last century. The cycloid is a curve generated by the motion of any point in the periphery of a circle, whilst the periphery revolves on a right line, till that point which touched the line at the beginning of the motion be brought to touch it again. Let the circle CDH, Plate LI, fig. 5, roll on the given straight line AB, so that all the parts of the circumference be applied to it one after another, the point C that touched the line AB in A, by a motion thus compounded of a circular and rectilinear motion, will describe the curve ACEB, called the cycloid or tochoid, from the manner of its formation. The circle CDH, by the revolution of which the curve is formed, is called the generating circle; the right line AB is the base; the line EF bisecting the base in F is the axis; and E is the vertex; a line KC parallel to the base, and intercepted between the curve and the axis, is an ordinate; and the space included by the curve and base, viz. AEBA, is the cycloidal space. If any point, which is not the centre of the generating circle, be taken in the diameter passing through the generating point; during the revolution of the circle it will describe a curve, which is called a prolate or inflected cycloid. But if the point be taken in the diameter produced, or without the circle, the curve, which it will describe, is called a curtate cycloid. The chief properties of the cycloid are, 1. If on the axis EF be described the generating circle EGF meeting the ordinate CK in G, the ordinate will be equal to the sum of the arc EG and its right sine GK; that is, CK will be equal to EG + GK. 2. The line CH parallel to the chord EG is a tangent to the cycloid in C. 3. The arch of the cycloid EL is double of the chord EM, of the corresponding arc of the generating circle EMF; hence the semi-cycloid ELB is equal to twice the diameter of the generating circle EF; and the whole cycloid ACEB is quadruple of the diameter EF. 4. If ER be parallel to the base AB, and CR parallel to the axis of the cycloid EF; the space ECR, bounded by the arc of the cycloid EC, and the lines ER and CR, shall be equal to the circle area ECK; hence it follows, if AT, perpendicular to the base AB, meet ER in T, the space ETACE will be equal to the semi-circle EGF; and since AF is equal to the semi-circumference EGF, the rectangle EFAT, being the rectangle of the diameter and semi-circumference, will be equal to four times the semi-circle EGF; and therefore the area ECAFE, will be equal to three times the area of the generating semi-circle EGF. Again, if you draw the line EA, the area intercepted betwixt the cycloid ECA, and the straight line EA, will be equal to the semi-circle EGF; for the area ECAFE is equal to three times EGF, and the triangle EAF = $AF \times \frac{1}{2}EF$, the rectangle of the semi-circle and radius, and consequently equal to 2 EGF; therefore their difference, the area ECAE, is equal to EGF. 5. Take Eb = OK, draw bZ parallel to the base, meeting the generating circle in X, and the cycloid in Z, and join CZ, FX; then shall the area CZEC be equal to the sum of the triangles GFK and bFX. Hence an infinite number of segments of the cycloid may be assigned, that are perfectly quadrable. For example, if the ordinate CK be supposed to cut the axis in the middle of the radius OE, then K and b coincide; and the area ECK becomes in that case equal to the triangle GKF, and EbZ becomes equal to bFX, and these triangles themselves become equal. The cycloid is the curve of quickest descent, i. e. a body falling in it, from any given point above, to another not exactly under it, will come to this point in a less time than in any other curve passing through those two points. See farther relating to the cycloid under MECHANICS and PENDULUM.

CYCLOPEDIA, [*κύκλος* and *παίδεια*,] a circle of knowledge; a course of the sciences.

CYCLOPEDIA, say the authors of the French Encyclopédie, ought to explain as much as possible the order and connection of human knowledge. See ENCYCLOPEDIA.

CYCLOPS, in fabulous history, the sons of Neptune and Amphitrite; the principal of whom were Polyphemus, Brontes, Steropes, and Pyracmon; but their whole number amounted to above one hundred. Jupiter threw them into Tartarus as soon as they were born; but they were delivered at the intercession of Tellus, and became the assistants of Vulcan. They were of prodigious stature, and had each only one eye, which was placed in the middle of their foreheads.

CYCLOPTERUS, the **SUCKER**, in ichthyology, a genus of the cartilaginous order; head obtuse, furnished with saw teeth; rays four in the gills; belly fins connected together in an orbicular form. There are ten species.

CYCLOPTERUS LIPARIS, the **LUMP FISH**, grows to the length of nineteen inches, and weighs seven pounds. The shape of the body is like that of the bream, deep and very thick, and it swims edgewise. The back is sharp and elevated; the belly flat, of a bright crimson colour. Along the body there run several rows of sharp and bony tubercles, and the whole skin is covered with small ones. The tail and vent-fins are purple. The pectoral fins are large and broad, almost uniting at their base. Beneath these is the part by which it adheres to the rocks, &c. It consists of an oval aperture, surrounded with a fleshy, muscular, and obtuse substance; edged with many small-threaded appendages, which concur as so many claspers. By means of this part it adheres with vast force to any thing it pleases. See Plate LV.

C. MINOR, the **LESSER SUCKING FISH**, is found in different parts of the British fens. It is about four inches in length; the skin without scales, slippery, and of a dusky colour. It has also an apparatus for adhering to stones and rocks similar to the others.

CYDER, or **CIDER**, a sharp, cool, and vinous beverage, made by fermenting the juice of apples. Some connoisseurs in this liquor are of opinion, that the juice of the more delicate table-fruit is generally more cordial and pleasant than that of the wild or harsh kinds; though others assert the latter to be in many respects preferable. The apples should remain on the tree till they are thoroughly ripe, when they ought to be gathered with the hand in dry weather, that they may be protected both from bruises and from moisture. They are then to be sorted, according to their various degrees of maturity, and laid in separate heaps, in order to sweat; in consequence of which they greatly improve. This practice, however, appears to be useful only for such fruit as is not perfectly ripe, though some recommend it as being proper for all apples. The duration of the time of sweating may be determined by the flavour of the fruit, as different kinds require various lengths of time; namely, from eight or ten days to six weeks. The harsher and more crude the apples are, the longer it is necessary that they should remain in a sweating state, and not only be well dried, but the rotten parts carefully pared, before they are exposed. The utility of the sweating practice is acknowledged in all the cyder countries, though various methods have been adopted in following it; as the apples are piled up either in the open air, or under cover in houses. In the South-hams, a middle way has been adopted to avoid the fermentation occasioned by piling them up in rooms, and which we recommend as the best, and most rational. Heaps of fruit are raised in an open part of the orchard, where, by means of a free air and less heat, the desired maturity is gradually effected, with an inconsiderable waste of the juice and decay of the fruit, which thus becomes almost totally divested of rancidity. And though a few apples will rot even in this manner, they are still fit for use; all of them continue plump and full of juice, and heighten in a considerable degree the colour of the liquor, without imparting to it any disagreeable smell or taste. The fruit is then to be ground till the rind and kernels are well bruised; a process which will considerably improve the flavour and strength of the liquor, when it should be allowed to stand for a day or two, in a large open vessel. It is next pressed between several hair-cloths, and the liquor received in a vat, whence it is removed into casks, which ought to be placed in a cool situation, or in the free air, with their bung-holes open. These casks are to be sedulously watched, till the cyder drops fine, when it is to be immediately racked off from the lees into other vessels. The first racking is a most important operation; as cyder, which is suffered to become foul again, by missing the first opportunity of racking it when fine, will never become what

is called a prime liquor. After the clear part has been racked off a quantity of lees or dregs remains, which, when filtered through coarse linen bags, yields a bright, strong, but extremely flat liquor: if this be added to the former portion, it will greatly contribute to prevent fermentation, an excess of which will make the cyder thin and acid. To avoid such an accident, the casks should neither be entirely filled, nor stopped down too close; and, if the whole incline to ferment, it ought again to be racked. This latter operation, however, should on no account be repeated, unless from absolute necessity; as every racking diminishes its strength. When there are no signs of any farther fermentation, the casks should be filled up with cyder of the best quality, and the bung-hole firmly closed with resin. This method of making cyder is that chiefly followed in Herefordshire. Considerable quantities of this liquor are also made in Devonshire, where the process varies but little from that pursued in the county before-mentioned. Several farmers, however, instead of racking, fine it with isinglass, steeped in white wine, dissolved over the fire, and then boiled in a quantity of liquor intended to be fined: in this state, it is added to that in the cask. Others, instead of dissolving the isinglass over the fire, digest it in white wine for the space of four or five weeks, during which time it acquires the consistence of a jelly; a quantity of this being beaten up with some of the liquor, the whole is worked into a froth, and mingled with the rest. As soon as the cyder becomes clear, it is drawn, or bottled off, as occasion may require. Those who are anxious to prepare good cyder, ought diligently to watch every change of weather, however slight; as the least neglect, at such times, is often detrimental to many hogsheads. In summer the danger is much greater than in winter. There is, however, scarcely any distemper incident to this liquor, which may not, by a timely application, be easily remedied. If it become somewhat tart, about half a peck of good wheat, boiled and hulled in a manner similar to rice, may be put into each hogshead, which will effectually restore it; and also contribute to preserve it, when drawn out of one cask into another. Such a remedy is doubtless far preferable to that odious custom practised by too many cyder merchants, who put animal substances into their liquors, namely, veal, pork, beef, mutton, and even horse-flesh, for the purpose of fining them. This singular expedient, though sanctioned by the usage of ancestors, we think it our duty to reprobate; because it is fraught with mischievous effects on the constitution of those, who are doomed to drink the cyder thus adulterated. By allowing a small quantity to stand in an open vessel for two or three days in a warm room, the fetid exhalation of the liquor will easily discover its ingredients. The best cyder is that made from a red-streak apple, grafted upon a gannet-moil stock. These two varieties of the apple-tree agree well together, and their trunks seldom canker, as others are apt to do, especially when the former is grafted on crab-trees. The fruit of the red-streak obtained from the former combination, is always larger and milder; and, when ripe, not only most delicious eating, but also affords a mellow liquor than the same fruit produced by the latter mixture. Many estates, where the soil is not proper for corn, might be greatly improved in value, by cultivating the different sorts of apples that are used in making cyder, which finds at all times a ready market, and requires no fuel in brewing it; besides that the labour occurs only once every year. The greater the quantities of cyder made together, the better it usually succeeds; but it will be necessary that the vessels in which the liquor is to be kept, be capacious and well seasoned. In this case, it will not only remain sound for a great number of years, but also progressively improve. An ingenious Treatise on Cyder, in 4to. was published about the year 1754, in which the reader will find several pertinent instructions relative to this subject. By the 27th Geo. III. c. 13, every hogshead of cyder or perry, made and sold by retail, pays a duty of 14s. 7d. to which are to be added, 4s. imposed by the annual malt-acts, the whole amounting to 18s. 7d. For every hogshead, made and sold in quantities of 20 gallons, or upwards, by any dealer or retailer, from fruit of his own growth, 6s. 11d.; and for every hogshead of such last-mentioned cyder or perry, received into the possession of any person, to be sold by him, 7s. 8d. are to be paid: the total of these duties, after adding the annual one of 4s., will amount to 18s. 7d. For every hogshead made in Great Britain, and sent or consigned to any factor or agent, who shall receive it for sale, to be paid by such factor,

19s. 2d.; but, if the latter have paid the annual malt-duty of 4s., this sum is to be deducted from the 19s. 2d. no cyder or perry being chargeable with a higher duty than 19s. 2d. All these duties are payable to the excise, and are drawn back on exportation; 3d. per ton being allowed. Cyder is a cooling, pleasant, and wholesome liquor during the heat of summer, if it has been prepared without foreign ingredients, and properly fermented. On the contrary, where it is too new, or tart, or has perhaps been kept in leaden vessels; or the apples and pears have, after grinding them, passed through leaden tubes, we can by no means recommend it as a salubrious beverage; because that poisonous metal is easily dissolved by the acid, and thus gradually introduced into the body. However agreeable such cyder, or perry, may stimulate the palate, it cannot fail, sooner or later, to produce painful and dangerous colics, as it not unfrequently generates the most desperate and incurable obstipations, among those who accustom themselves to the free use of these liquors.

CYDER SPIRIT, a spirituous liquor drawn from cyder by distillation, in the same manner as brandy from wine. The particular flavour of this spirit is not agreeable, but it may be entirely divested of it, and rendered perfectly pure by rectification. The traders in spirituous liquors are well acquainted with the value of such a spirit as this: they can give it the flavours of some other kinds, and sell it under their names, or mix it in large proportion with foreign brandy, and arrack, in the sale, without danger of detection.

CYDER WINE, a kind of wine made from the juice of apples taken from the press and boiled, and which being kept three or four years is said to resemble Rhenish. The method of preparing it, as communicated by Dr. Rush of America, where it is much practised, consists in evaporating in a brewing copper the fresh apple-juice till half of it be consumed. The remainder is then immediately conveyed into a wooden cooler, and afterwards put into a proper cask, with an addition of yeast, and fermented in the ordinary way. The process is evidently borrowed from what has long been practised on the recent juice of the grape, under the term of vin cuit, or boiled wine, in Italy, and the islands of the Archipelago, from time immemorial.

CYDERKIN PURKE, or **PERKIN**, is a liquor made of the muck, or lees remaining after the cyder is pressed: these are put into a large vat, with half the quantity of cold water, which has been previously boiled: if that proportion be exceeded, the cyderkin will be small. The whole is left to digest for forty-eight hours, when it should be well expressed: the liquor thus obtained is to be immediately barrelled, and closely stopped; it will be fit for use in a few days. Cyderkin easily clarifies, and is used in many families instead of small beer: if boiled after pressure, with a proper quantity of hops, it may be kept for any length of time.

CYDONIA, or **CYDON**, in ancient geography, one of the three most illustrious cities of Crete, situated in the N. W. of the island, with a locked port, or walled round.

CYGNUS, the **SWAN**, in astronomy, a constellation of the northern hemisphere, between Lyra and Cepheus. See **ASTRONOMY**.

CYGNUS, the **SWAN**, in ornithology. See **ANAS**.

CYLINDER, [κύλινδρος,] in geometry, a solid body, supposed to be generated by the rotation of the parallelogram. If the generating parallelogram be rectangular, the cylinder it produces will be a right cylinder, that is, it will have its axis perpendicular to its base. If the parallelogram be a rhombus, or rhomboides, the cylinder will be oblique or scalenous.

CYLINDER, PROPERTIES OF THE. 1. The section of every cylinder by a plane oblique to its base, is an ellipsis. 2. The superficies of a right cylinder is equal to the periphery of the base multiplied into the length of its side. 3. The solidity of a cylinder is equal to the area of its base, multiplied into its altitude. 4. Cylinders of the same base, and standing between the same parallels are equal. 5. Every cylinder is to a spheroid inscribed in it, as 3 to 2. 6. If the altitudes of two right cylinders be equal to the diameters of their bases, those cylinders are to one another as the cubes of the diameters of their bases. To find a circle equal to the surface of a cylinder, we have this theorem; the surface of a cylinder is equal to a circle, whose radius is a mean proportional between the diameter and height of the cylinder. The diameter of a sphere, and the altitude of a cylinder equal thereto, being given, to find the diameter of the cylinder, the theorem is, the

square of the diameter of the sphere is to the square of the diameter of the cylinder equal to it, nearly, as triple the altitude of the cylinder to double the diameter of the sphere. See **GEOMETRY**.

CYLISTA, in botany, a genus of the diadelphia decandria class and order; natural order papilionaceæ or leguminosæ. Calyx very large, four-parted; the upper division cleft at the end; corolla permanent. There is but one species, viz. *C. villosa*, hairy cylista. It is a shrub, and requires the heat of the stove to preserve it.

CYMBACHNE, in botany, a genus of the polygamia monœcia class and order; natural order Gramina. Inflorescence half-spiked; herm. calyx two-glumed, one-flowered, parallel to the rachis; outer valve linear, the opposite boat-form; female calyx one-glumed, ovate, opposite to the rachis. One species, viz. *C. ciliata*, a slender grass, a foot in height, with several culms. It is found in Bengal.

CYLINDER, LOADED, OR CYLINDER, ROLLING, a cylinder which rolls in an inclined plane. Its phenomena will be found explained under **MECHANICS**.

CYLINDROID, [from κύλινδρος, cylinder, and ὅμοιος, likeness,] in geometry, a solid body, approaching to the figure of a cylinder, but differing from it in some respects, as having the bases elliptical, but parallel and equal.

CYMATIUM, [Lat. from κυματιον, a little wave,] a member of architecture, whereof one-half is convex, and the other concave. There are two sorts, of which one is hollow below, as the other is above. See **ARCHITECTURE**.

CYMBAL, [κύμβαλον,] a musical instrument much used among the ancients. It was formerly made of brass, like our kettle-drums, and, as some think, in their form, but smaller and of different use. Ovid gives cymbals the epithet of genitalia, because they were used at weddings and other diversions. Cassiodorus and Isidore call this instrument acetabulum, the name of a cup or cavity of a bone wherein another is articulated; and Xenophon compares it to a horse's hoof; whence it must have been hollow; which appears, too, from the figure of several other things denominated from it; as a basin, caldron, goblet, cask, and even a shoe, such as those of Empedocles, which were of brass. The ancient cymbals appear to have been very different from our kettle-drums, and their use of another kind. To their exterior cavity was fastened a handle; whence Pliny compares them to the upper part of the thigh, and Rabanus to phials. They were struck against one another, in cadence, and made a very acute sound. Their invention was attributed to Cybele: whence their use in feasts and sacrifices. The modern cymbals is a mean instrument, chiefly in use among vagrants, gypsies, &c. it consists of steel wires, in a triangular form, whereon are passed five rings, which are touched and shifted along the triangle with an iron rod held in the left hand, while it is supported in the right by a ring, to give it the freer motion.

CYMBARIA, in botany, a genus of the didynamia angiospermia class and order; natural order, Personatæ. Calyx ten-toothed; capsule cordate, two-celled. There is but one species.

CYME, or **CUMA**, in ancient geography, a city built by Pelops on his return from Greece. It stood in Æolia, between the Myrina and Phocæa, and in Pentinger's map, is set down 9 miles from Myrina.

CYNANCHE, a species of quinzey, in which the tongue is inflamed and swelled, so that it hangs out beyond the teeth.

CYNANCHUM, **BASTARD DOGBANE**: a genus of the digynia order, and pentandria class of plants; natural order, Contortæ. Nectarium cylindrical, five-toothed. It has twenty-seven species, shrubs chiefly twining, and natives of hot climates.

CYNANTHROPY, [ὁ καὶ ἡ κύων, τὸ καὶ τῆς νόσος, and ἀνθρωπίνος,] a species of madness in which men have the qualities of dogs.

CYNARA, the **ARTICHOKE**, a genus of the polygamia æqualis order, and syngenesia class of plants. Calyx dilated, imbricated with carnosous squamæ, and emarginated with a sharp point. Of this genus there are six species: of which two are cultivated for use.

CYNICS, [κύνες,] a sect of ancient philosophers, who valued themselves upon their contempt of riches and state, arts and sciences, and every thing, in short, except virtue or morality. The cynic philosophers owe their origin and institution to Antisthenes of Athens, a disciple of Socrates, who, being asked of what use his philosophy had been to him, replied, "It enables me to live with myself." Diogenes was the most famous of his disciples, in whose life.

life the system of this philosophy appears in its greatest perfection. He led a most whimsical life, despising every kind of convenience, a tub serving him for a lodging, which he rolled before him wherever he went. Yet he was not the more humble on account of his ragged cloak, bag, and tub. One day entering Plato's house, at a time when there was a splendid entertainment for several persons of distinction, he jumped up, in all his dirt, upon a very rich couch, saying, "I trample on the pride of Plato." "Yes (replied Plato), but with still greater pride, Diogenes." He had the utmost contempt for all the human race; for he walked the streets of Athens at noon day with a lighted lantern in his hand, telling the people, "He was in search of an honest man." Amongst many excellent maxims of morality, he held some very pernicious opinions; for he used to say, that the uninterrupted good fortune of Harpalus, who generally passed for a thief and a robber, was a testimony against the gods. He regarded chastity and modesty as weaknesses: hence Laertius observes of him, that he did every thing openly, whether it belonged to Ceres or Venus; though he adds, that Diogenes only ran to an excess of impudence to put others out of conceit with it. But impudence was the characteristic of these philosophers; who argued that all what was right to be done, might be done at all times and in all places. The chief principle of this sect, in common with the stoics, was, that we should follow nature. But they differed from the stoics in their explanation of that maxim; the cynics being of opinion, that a man followed nature, who gratified his natural appetites; while the stoics understood right reason by the word nature.

CYNIC SPASM, a kind of convulsion, wherein the patient imitates the howling of dogs.

CYNIPS, **GALL-FLY**, a genus of insects of the order hymenoptera. Mouth with a short one-toothed membranaceous jaw, the mandibles vaulted; horny cleft, the lip entire, feelers four, short, unequal, capitate; antennæ moniliform; stigm spiral, often concealed within the body. There are thirty-five species. The numerous excrescences, or galls, found on the roots, branches, and leaves of various trees are produced by the puncture of these insects: the larva is without feet, soft, cylindrical, and inhabits within the gall, feeding on the juices of the tree: the pupa resembles the perfect insect, except in having only the rudiments of wings. *C. querci*, or oak-leaf cynips, is of a burnished shining brown colour. It is found in the hard galls under oak-leaves, generally fastened to the fibres. *C. rosæ* is represented in Plate XXXVII.

CYNOGLOSSUM, **HOUND'S TONGUE**: a genus of the monogynia order, and pentandria class of plants; natural order, Asperifolia. Corolla funnel-shaped, with its throat closed up by little arches formed in it; seeds depressed, and affixed to the style or receptacle only on their inner side. Twelve species have been noticed, none of them remarkable for beauty.

C. OFFICINALE, the **COMMON GREATER HOUND'S TONGUE** was formerly used in medicine, and its root supposed to possess narcotic virtues; but it is discarded from the present practice.

CYNOMETRA, in botany, a genus of the monogynia order, and decandria class of plants. Calyx tetraphyllous; antheræ, bifid at top; legumen carnosus, crescent-shaped, and monospermous. Two species are found in India.

CYNOMORIUM, in botany: a genus of the monandria order, and monœcia class of plants; natural order, Amentaceæ. Male calyx, an imbricated catkin; no corolla; calyx of the female in the same catkin; no corolla; one style; and one roundish seed. It has three species.

CYNOPHONTIS, in antiquity, a festival observed in the dog-days at Argos, and so called *ἀπὸ τῶν κύωνος φονεῖν*, i. e. from killing dogs; because it was usual on this day to kill all the dogs they met with.

CYNOREXY, an immoderate appetite, to the degree of a disease; called also *fames canina* and *bulimy*.

CYNOSURA, in astronomy, a denomination given by the Greeks to *ursa minor*, or the little bear, from *κυνόρρα*, *q. d. ἡ τῆς κύωνος ὅρα*, the dog's tail.

CYNOSURA, in mythology, a nymph of Ida in Crete, said to have nursed Jupiter, who changed her into a star.

CYNOSURUS, **DOG'S-TAIL GRASS**, in botany, a genus of the digynia order, and triandria class of plants; natural order, Gramina. Calyx bivalved, multiflorous; receptacle proper, unila-

teral, foliaceous. There are twenty species, most of them natives of the East or West Indies.

CYNTHIA, an epithet of Diana.

CYNTHIUS, an epithet of Apollo.

CYNTHUS, in ancient geography, a mountain of the island Delos, so high as to overshadow the whole island. On this mountain Larona was fabled to have brought forth Apollo and Diana; hence called Cynthus and Cynthia.

CYNURIA, or **CYNURIUS AGER**, in ancient geography, a district of Laconia, on the confines of Argolis, that proved a perpetual bone of contention between the Argives and Spartans.

CYPERUS, in botany, a genus of the monogynia order, and triandria class of plants; natural order, Calamariæ. Glumes paleaceous, imbricated towards each side; corolla wanting; seed one, naked. There are fifty-three species, chiefly natives of the East or West Indies.

CYPHER. See **CIPHER**, and **ARITHMETIC**.

CYPHON, in antiquity, a kind of punishment used by the Athenians. It was a collar made of wood; so called because it constrained the criminal to bow down his head.

CYPHONISM, or **CYPHONISMUS**, [from *κύφω*, derived from *κύβης*, crooked,] a kind of torture or punishment, in use among the ancients.

CYPRÆA, the **GOWRIE**, a genus of insects of the order vermes testacea. Animal, a slug; shell one, involuted, subovated, obtuse, smooth valve; aperture on each side linear, longitudinal, and toothed. There are 44 species, distinguished by the form of their shells. See Plate XXVII.

CYPRESS. See **CUPRESSUS**.

CYPRIAN QUEEN, a title of Venus.

CYPRIANUS, **THASCIUS-CÆCILIUS**, a principal father of the Christian church, born at Carthage, about the end of the second, or beginning of the third century. His parents were heathens; and he himself continued such till the last 12 years of his life. He applied himself early to the study of oratory; and some of the ancients, particularly Lactantius, informs us, that he taught rhetoric in Carthage with the highest applause. Cyprian's conversion is fixed by Pearson to A.D. 246. He was at Carthage, where, as St. Jerom observes, he had often employed his rhetoric in the defence of paganism. It was brought about by one Cæcilius, a priest of the church of Carthage, whose name Cyprian afterwards took; and between whom there ever after subsisted so close a friendship, that Cæcilius at his death committed to Cyprian the care of his family. Cyprian was also a married man himself; but as soon as he was converted, he resolved upon a state of continence, which was then foolishly thought a high degree of piety. As a proof of the sincerity of his conversion, he wrote in defence of Christianity, and composed his piece "De Gratia Dei," which he addressed to Donatus. He next composed a piece "De Idolorum Vanitate," upon the vanity of idols. Cyprian's behaviour, both before and after his baptism, was so highly pleasing to the bishop of Carthage, that he ordained him a priest a few months after, though it was rather irregular to ordain a man thus in his very noviciate. But Cyprian was so extraordinary a person, and thought capable of doing such singular service to the church, that the usual period of probation was dispensed with. He consigned over all his goods to the poor, and gave himself up entirely to divine things. When, therefore, the bishop of Carthage died the year after, viz. A.D. 248, none was judged so proper to succeed him as Cyprian. The repose, which the Christians had enjoyed during the last 40 years, had greatly corrupted their manners; and therefore Cyprian's first care, after his advancement to the bishopric, was to reform abuses. Luxury was prevalent among them; and many of their women were not strict in the article of dress. This led him to draw up his piece "De Habitu Virginum," concerning the dress of young women; in which, besides what he says on that particular, he inculcates many lessons of modesty and sobriety. In 249, Decius issued very severe edicts against the Christians; and in 250, the heathens, in the circus and amphitheatre of Carthage, insisted upon Cyprian's being thrown to the lions. Cyprian upon this withdrew from Carthage, to avoid the fury of his persecutors. He wrote, in the place of his retreat, pious and instructive letters to those who had been his hearers; and also to the Libellatici, or those pusillanimous Christians, who procured certificates of the heathen magistrates, to shew that they had complied

complied with the emperor's orders, in sacrificing to idols. At his return to Carthage he held several councils on the repentance of those who had fallen off during this persecution, and other points of discipline; he opposed the schemes of Novatus and Novatianus; and contended for the re-baptizing of those who had been baptised by heretics. At last he died a martyr in the persecution under Valerian and Gallienus, in 258. Cyprian wrote 81 letters, and several treatises. The best editions of his works are those of Pamelius in 1568; of Rigaltius in 1648; and of Oxford in 1682. His works have also been translated into English by Dr. Marshall.

CYPRINUS, the **CARP**, in natural history, a genus of fishes of the order abdominales. Mouth small and without teeth; gill membrane, with three rays; ventral fins often, and, perhaps, generally nine-rayed. There are fifty species, of which *C. carpio*, or the common carp, inhabits the slow and stagnant waters of many countries of Europe, in which it is found extremely to vary in size, from sixteen inches, to the length of three or four feet. In Persia the carp is not unfrequently found of this length, and will weigh from 30 to 40 pounds. It was introduced into England in the sixteenth century. It feeds on herbs, worms, and water insects: it is extremely prolific; the roe having been occasionally found to weigh as much as the real substance of the fish: the principle of vitality in the carp is uncommonly strong: it may be kept alive in a damp situation for a very considerable time after being taken from the water; and if wrapped in wet moss, and plunged in water every four hours, and fed on bread and milk, will not only continue to exist, but will thrive and fatten: it has been ascertained to live to a very considerable age, when they become completely white. The carp was classed by the ancients among sea-fish; it is, however, generally found in ponds and rivers; and now considered as a fresh-water fish. For a variety of this species, called the large-scaled carp, see Plate LV.

C. AURATUS, the **GOLDEN-FISH**, a small fish domesticated by the Chinese, and generally kept for ornament by great people in their courts and gardens. They breed them in small ponds made for the purpose, in basons, and even in porcelain vessels. This fish is no larger than our pilchard. The male is of a bright red colour from the top of the head to the middle of the body: the rest is of a gold colour; but it is so bright and splendid, that the finest gilding, according to F. le Comte, cannot approach it. The female is white; but its tail and half of its body resemble the lustre of silver. F. du Halde, however, observes, that a red and white colour are not always the distinguishing marks of the male and female; but that the females are known by several white spots which are seen round the orifices that serve them as organs of bearing, and the males, by having these spots much brighter. Gold fish are light and lively; they love to sport on the surface of the water, soon become familiarized, and may be even accustomed to come and receive their food on sounding a small rattle.

C. BARBUS, the **BARBEL**, is extremely coarse. They frequent the still and deep parts of rivers, and live in society, rooting like the swine with their noses in the soft banks. They are so tame as to suffer themselves to be taken by the hand; and people have been known to take numbers by diving for them. In summer they move about during the night in search of food; but towards autumn, and during winter, confine themselves to the deepest holes.

C. BRAMA, the **BREAM**, is an inhabitant of lakes, or the deep parts of still rivers. It is a fish that is very little esteemed, being extremely insipid.

C. CEPHALUS, the **CHUB**, is a very coarse fish and full of bones. It frequents the deep holes of rivers; and in summer commonly lies on the surface, beneath the shade of some tree or bush.

C. GOBIO, the **GUDGEON**, is generally found in gentle streams, and is of a small size, the largest not exceeding half a pound weight. They bite eagerly; and are assembled by raking the bed of the river; to this spot they immediately crowd in shoals, in expectation of food.

C. LEUCISCUS, the **DACE**, is gregarious, haunts deep still waters, is a great breeder, very lively, and during summer is very fond of frolicing near the surface of the water. It never exceeds the weight of a pound and an half; the scales are smaller than those of the roach.

C. RUTILUS, the **ROACH**, is a common fish found in many of the deep still rivers of this country. They are gregarious, keeping in large shoals.

C. TINCA, the **TENCH**, has by some been called the physician of the fish; and its slime has been said to be of so healing a nature, that the wounded fishes apply it as a styptic. In this country it is reckoned a wholesome and delicious food; but the Germans are of a different opinion. By way of contempt they call it the shoemaker.

CYPRIPEDIUM, the **LADY'S SLIPPER**, in botany, a genus of the diandria order, and gynandria class of plants; natural order, Orchidæ. Nectarium ventricose, inflated, hollow. There are five species.

CYPRUS, an island situated in the Levant, or most easterly part of the Mediterranean sea, between 33° and 36° lon. E. and 30° and 34° lat. N. It is 220 miles long, 65 broad, and about 600 in circumference; and is divided from E. to W. by a chain of mountains, the highest of which are St. Croix, Buffavent, and Olympus. In ancient times this island was known by the names of Acamis, Aërosa, Amathus, Aspalia, Cerastis, Colinia, Cryptos, Macaria, Paphia, Salamina, and Sphecia. The name by which it was most generally known is Cyprus, said to be derived from Cypros, a shrub or tree, with which the island abounded; supposed to be the cypress.

CYPRUS, KNIGHTS OF, an order instituted by Guy de Lusignan, titular king of Jerusalem, to whom Richard I. of England, after conquering Cyprus, made over his right.

CYRENAICA, an ancient kingdom of Africa, corresponding to the present kingdom and desert of Barca and Tripoli.

CYRENAICS, a sect of ancient philosophers, so called from their founder Aristippus of Cyrene, a disciple of Socrates. See **ARISTIPPUS**. The great principle of their doctrine was, that the supreme good of man in this life is pleasure; whereby they not only meant a privation of pain, and a tranquillity of mind, but an assemblage of all mental and sensual pleasures, particularly the last.

CYRENE, in ancient geography, the capital of Cyrenaica, and one of the five cities called Pentapolis, distant from Apollonia, its sea-port, 10 miles.

CYRILL, St. bishop of Jerusalem, succeeded Maximus in 350. He was afterwards deposed for a most praise-worthy action; viz. selling the treasures of the church, and applying the money to the support of the poor during a great famine. But the spirit of Antichrist, which led the clergy to prefer the grandeur of the church to the good of the people, was then beginning to work. Under Julian he was restored to his see, and firmly established in all his honours under Theodosius; in which he continued unmo- lested to his death, in 386. The remains of this father consist only of 23 catecheses, and one letter to the emperor Constantius.

CYRILL, St. patriarch of Alexandria, succeeded Theophilus, his uncle, in 412. Scarce was he installed, when he began to exert his authority with great vigour; he drove the Novations and Jews from Alexandria, permitting their wealth and synagogues to be taken from them. This proceeding highly displeased Orestes, the governor, who saw, that if the bishop's authority was not soon suppressed, it might grow too strong for that of the magistrate. Upon which a kind of civil war broke out between Orestes and the bishop; many tumults were raised, and some battles fought in the very streets of Alexandria. St. Cyrill also distinguished himself by his zeal against Nestorius, bishop of Constantinople, who, in some of his homilies, had asserted that the Virgin Mary ought not to be called the mother of God. The dispute at first proved unfavourable to Cyrill, whose opinion was not only condemned, but himself deprived of his bishopric and thrown into prison. But he was soon after released, and gained a complete victory over Nestorius, who in 431 was deposed from his see of Constantinople. Cyrill returned to his see at Alexandria, where he died in 444. St. Cyrill also wrote against Theodorus of Mopsuestia, Diodorus of Tarsus, and Julian the apostate. He composed commentaries on St. John's Gospel, and wrote several other books. His works were published in Greek and Latin in 1638, in six volumes folio.

CYRUS the **GREAT**, the founder of the united empire of the Medes and Persians. The two chief historians, who have written the life of Cyrus, are Herodotus and Xenophon; but their accounts of him are extremely different. The former tells us, that Astyages, king of the Medes, dreamed, that a vine sprung from the womb of his daughter Mandane, the branches whereof overshadowed all Asia; whereupon, having consulted the soothsayers, he was told that this dream portended the future power and greatness

of a child who should be born of his daughter; and further, that this child should deprive him of his kingdom. Astyages, to prevent the accomplishment of this prediction, married his daughter to Cambyzes, a Persian of mean condition, who had no capacity for forming any important design, nor for supporting the ambition of his son, by his own riches and authority. And lest Mandane's son should find that assistance in his own courage, or some lucky circumstances, which his family was not able to supply him with, he commanded one of his officers, named Harpagus, to destroy the infant as soon as it came into the world. Harpagus, fearing the resentment of Mandane, put the child into the hands of one who was the king's shepherd. The shepherd's wife was so extremely touched with the beauty of Cyrus, that she desired her husband rather to expose her own son, who was born some time before, (a story equally unnatural and incredible,) and preserve the young prince. Thus Cyrus was preserved, and brought up among the king's shepherds. One day, as the neighbouring children were at play together, Cyrus was chosen king; and having punished one of his play-fellows with some severity, for disobeying his commands, the child's parent complained of Cyrus to Astyages. This prince sent for young Cyrus, and observing something great in his air, together with a great resemblance of his daughter Mandane, he made particular inquiry into the matter, and discovered that Cyrus was his grandson. Harpagus, who was the instrument of preserving him, was punished with the death of his own son; but Astyages believing that the royalty which the soothsayers had promised to the young prince, was only that which he had lately exercised among the shepherds' children, laid aside his fears. Cyrus being grown up, Harpagus disclosed the secret of his birth to him, with the manner wherein he had delivered him from his grandfather's cruelty. He encouraged him to come into Media, and promised to furnish him with forces, in order to make him master of the country, and depose Astyages. Cyrus hearkened to their propositions, engaged the Persians to take arms against the Medes, marched at the head of them to meet Astyages, defeated him, and possessed himself of Media. He carried on many other wars; and at length sat down before Babylon, which, after a long siege he took. Xenophon's account of Cyrus's life is more credible, and has less of the miraculous in it. Astyages, king of Media, married his daughter Mandane to Cambyzes, king of Persia, son and successor to Achæmenes. Cyrus was born at his father's court, and was educated with all the care his birth required. When he was about the age of 12, his grandfather Astyages sent for him to Media, together with his mother Mandane. Some time after, the king of Assyria's son having invaded Media, Astyages, with his son Cyaxares, and his grandson Cyrus, marched against him. Cyrus distinguished himself in this war, and defeated the Assyrians. Cambyzes afterwards recalled him, that he might have him near his own person; and Astyages dying, his son Cyaxares, uncle by the mother's side to Cyrus, succeeded him in the kingdom of Media. Cyrus, at the age of 30, was, by his father Cambyzes, made general of the Persian troops; and sent at the head of 30,000 men to the assistance of his uncle Cyaxares, whom the king of Babylon, and his allies, the Cappadocians, Carians, Phrygians, Cilicians, and Paphlagonians, were preparing to attack. Cyaxares and Cyrus prevented them, by falling upon them and dispersing them. Cyrus advanced as far as Babylon, and spread terror throughout the country. From this expedition he returned to his uncle, towards the frontiers of Armenia and Assyria, and was received by Cyaxares in the tent of the Assyrian King whom he had defeated. After this, Cyrus carried the war into the countries beyond the river Halys, entered Cappadocia, and subdued it entirely. From thence he marched against Cræsus king of Lydia, beat him in the first battle; then besieged him in Sardis his capital; and after a siege of 14 days, obliged him to surrender. See Cræsus. After this, Cyrus having almost reduced all Asia, repassed the Euphrates, and made war upon the Assyrians. He marched directly to Babylon, took it, and there prepared a palace for his uncle Cyaxares, whither he might retire, if at any time he had an inclination to come to Babylon; for he was not then in the army. After all these expeditions, Cyrus returned to his father and mother into Persia, where they were still living; and going some time after to his uncle Cyaxares into Media, he married his cousin, the only daughter and heiress of all Cyaxares's dominions, and went with her to Babylon, from whence he sent men of the first rank and quality to govern all the several

nations which he had conquered. He engaged again in several wars, and subdued all the nations that lie between Syria and the Red Sea. He died at the age of 70 years, after a reign of 30; but authors differ very much concerning the manner of his death. Daniel (viii. 3—29.) in the famous vision wherein God shewed him the ruin of the four great empires, which were to precede the birth of the Messiah, represents Cyrus, or rather his extensive empire, under the idea of "a ram, which had two horns; the one was higher than the other, and the higher came up last." The ram's two horns signify the two empires which Cyrus united in his person; that of the Medes, and that of the Persians. The latter was greater and more powerful than the former. Cyrus succeeded his father Cambyzes in the kingdom of Persia, and his uncle Darius the Mede, by Xenophon called Cyaxares, in the kingdom of the Medes, and empire of Babylon. He was monarch of all the East; or as he himself speaks (2 Chr. xxxvi. 22, 23, and Ezra, i. 1, 2.) "of all the earth," when he permitted the Jews to return into their own country; A.M. 3466, and B. C. 538. The enemies of the Hebrews, making use of this prince's affection to his own religion, prevailed with him to put a stop by his orders to the building of the temple at Jerusalem; (Ezra iv. 5.) The prophets frequently foretold the coming of Cyrus; and Isaiah (xlv. 28.) is so particular as to declare his name above 100 years before his birth. Josephus (Antiq. I. II. c. 2.) says, that the Jews of Babylon shewed this passage of the prophet to Cyrus, which is extremely probable: and that this prince, in the edict which he granted them for their return, acknowledged that he received the empire of the world from the God of Israel; and that the same God had described him by name in the writings of the prophets, and foretold that he should build a temple to him at Jerusalem. Cyrus is expressly stiled in scripture "the righteous man, the Lord's anointed, and the shepherd of Israel;" (Isaiah xli. 2, xlv. 1, and xlv. 28.) Notwithstanding this, God says of him, (Isa. xlv. 5.) "I girded thee, though thou hast not known me." And Jeremiah calls Cyrus and his people, who overthrew the Babylonish empire, thieves and robbers; as indeed most great conquerors may be justly stiled. The taking of Babylon by Cyrus, was clearly foretold by the prophets. Abp. Ussher fixes the birth of Cyrus to A.M. 3405; his first year at Babylon to 3466, and his death to 3475. The eastern people say, that Cyrus by the mother's side was descended from some of the Hebrew prophets; and that his wife was a Jewess, which they assign as the reasons of his favouring the Jews.

CYRUS the YOUNGER, son of Darius Nothus, and brother of Artaxerxes. He was sent by his father at the age of 16, to assist the Lacedæmonians against Athens. Artaxerxes succeeded to the throne at the death of Nothus; and Cyrus, mad with ambition, attempted to assassinate him. He was discovered, and would have been punished with death, had not his mother Parysatis saved him by her tears and intreaties. This circumstance did not check the ambition of Cyrus; he was appointed over Lydia and the sea-coasts, where he secretly fomented rebellion and levied troops under various pretences. At last he took the field with an army of 100,000 barbarians; and 13,000 Greeks under the command of Clearchus. Artaxerxes met him with 900,000 men near Cunaxa. The battle was long and bloody; and Cyrus might have perhaps obtained the victory, had not his uncommon rashness proved his ruin. It is said that the two royal brothers met in person, and their engagement ended in the death of Cyrus, 401 years before the Augustan age.

CYTHERA, in ancient geography, an island opposite to Boiæ a town of Laconia; sacred to Venus, with a very ancient temple of that goddess. It is now called CERIGO.

CYTHERA, a town in the above island. It has a good port, called Scandea.

CYTHEREA, in mythology, the surname of Venus, so called from Cythera, her birth place, where she had a temple.

CYTHERIADES, an epithet of the Graces who attended Venus on the shore of Cythera.

CYTINUS, in botany, a genus of the dodecandria order, and gynandria class of plants; natural order, Sarmenaceæ. Calyx quadrifid, superior; no corolla; antheræ are 16, sessile; fruit an octolocular polyspermous berry. One species.

CYTISUS, LABURNUM, a genus of the decandria order, and diadelphica class of plants; natural order, Papilionacæ. Calyx bilabiated, with the upper lip bifid; inferior, tridentate; legumen attenuated

attenuated at the base. Eighteen species, shrubs without spine; most of them proper for plantations.

CYZICUM, in ancient geography, an island of the Propontis, on the coast of Mysia.

CYZICUM, or CYZICUS, one of the noblest cities of the Hither Asia; situated in the above island. It was a colony of the Milesians, and is famous for its siege by Mithridates, which was raised by Lucullus.

CZACKTHURN, a town of Germany, in Austria, near the frontiers of Hungary. It seems to be the same with Csakathurn. Lon. 17. 19. E. Lat. 46. 24. N.

CZACSANICH, a town of Poland, in the palatinate of Bracław; 38 miles S. of Bracław.

CZAR, [a Slavonian word, written more properly *tzar*,] the title of the emperor of Russia.

CZAR is pronounced *tzar*, or *zaar*, by the Russians; and this, by corruption (it has been fancied) from *Cesar*, emperor, from some imagined relation to the Roman emperors. But this etymology does not seem correct. When the Czar Peter formally required of the European courts an acknowledgment of his imperial titles, and that the appellation of Emperor should never be omitted, there was great difficulty made about it, especially at the court of Vienna. At the same time it occasioned a curious controversy among the learned, concerning the rise and progress of the titles by which the monarchs of this country have been distinguished. From their researches, it appeared that the early sovereigns of Russia were called great dukes, and that Vassili Ivanovitch was probably the first who styled himself *tzar*, an expression which, in the Slavonian language, signifies *king*; and that his successors continued to bear, within their own dominions, that title, as the most honourable appellation, until Peter the Great first took that of Povelitel, or emperor. After many delays and objections, the

principal courts of Europe consented, about 1772, to address the sovereign of Russia with the title of Emperor; without prejudice, nevertheless, to the other crowned heads of Europe.

CZARNOKOZYNECZIE, a town of Poland, in the palatinate of Kaminić; 12 miles W. of Kaminić.

CZASLAU, or TCHASLAU, a circle of Bohemia.

CZASLAU, the capital of the above circle, 42 miles E. S. E. of Prague.

CZENSTOKOW, or CZESTOCHOW, a town of Poland, in the palatinate of Cracovia, with a fort, in which they keep a rich treasure, called the treasure of the Virgin Mary. The town is situated on the river in Wartę, 50 miles N. N. W. of Cracow.

CZERNIC CZERNICK, or CZIRNITZ, a town of Germany, in the circle of Austria, and province of Carniola.

CZERNIGOF, or CZERNIKOU, a duchy of Russia; also the capital of the duchy, 76 miles N. by E. of Kiow.

CZIRNITZER ZEE, a very extraordinary lake of Austria, in Carniola, 15 miles long and five broad, which annually produces both fish and corn: for in summer being dry, its bottom is cultivated, and it produces corn, grass, &c.; but about the 29th of September the water rushes in from several subterraneous passages, through large apertures; which with the rains and streams that fall from the mountains, quickly fill it again for the winter season. These subterraneous passages are probably connected with some gulf, the ebbing or flowing of whose waters depend upon periodical winds or currents.

CZONGRODT, a territory of Upper Hungary.

CZONGRODT, the capital of the territory. Lon. 20. 17. E. Lat. 46. 50. N.

CZUDNOW, a town of Poland, in that part of the Ukraine, seized by Catherine II. in 1793, and annexed to Russia.

D.

D Is a consonant nearly approaching in sound to T, but formed by a stronger appulse of the tongue, to the upper part of the mouth. The sound of D in English is uniform, and it is never mute. It is the fourth of the alphabet, and the third consonant. Grammarians generally reckon D among the lingual letters, as supposing the tongue to have the principal share in the pronunciation thereof; tho' the Abbot de Dangeau seems to have reason in ranking it with those of the palate. The letter D is the fourth in the Hebrew, Chaldee, Samaritan, Syriac, Greek, and Latin alphabets; in the five first of which languages it has nearly the same name; *e. g.* in Hebrew, Chaldee, and Samaritan, *Daleth*, in Syriac *Dolet*, and in Greek *Delta*. The form of our D is the same with that of the Latins, as appears from all the ancient medals and inscriptions; and the Latin D is only the Greek Δ, rounded a little by making it quicker and at two strokes. The Δ of the Greeks, again, is borrowed from the ancient character of the Hebrew *Daleth*; which form it still retains, as is shewn by the Jesuit Souciet, in his Dissertation on the Samaritan Medals. As a numeral, D signifies 500; D, with a dash or line above it thus $\overline{D}$, denotes 5000. As an abbreviation, D, has various significations: thus D stands for Doctor; as, M. D. for Doctor of Medicine; D. T. Doctor of Theology; D. D. Doctor of Divinity, or *dono dedit*; D. D. D. *dat, dicat, dedicat*; and D. D. D. D. for *dignum Deo donum dedit*.

DA, in music books, signifies for or by.

DAB. See PLEURONECTES.

DABUL, a town of Hindostan, on the coast of Malabar, S. of the gulf of Cambaye, 75 miles S. W. of Bombay.

DACCA, a city of Hindostan, in the E. quarter of Bengal, seated on a branch of the Ganges. Dacca is 160 miles N. E. of Calcutta.

DACE is a species of Cyprinus, which see.

DACHAU, or DACHAW, a town of Bavaria in Germany. Lon. 11. 30. E. Lat. 48. 20. N.

DACHSTEIN, a town of France, in the department of the Lower Rhine, 8 miles W. of Strasburg.

DACIA, in ancient geography, a country which Trajan, who reduced it to a province, joined to Moesia by an admirable bridge. This country lies extended between the Danube and the Carpathian mountains, from the river Tibiscus, quite to the N. bend of the Danube.

DACIA AURELIANA, a part of ancient Illyricum, which was divided into the eastern and western; Sirium being the capital of the latter, and Sardica of the former.

DACIER, ANDREW, a learned Frenchman, was born of Protestant parents at Castres, in 1651, and educated at Saumur under Tanaquil Faber, or Le Fevre, whose learned daughter he married. He published at Paris, in 1681, an edition of Pompeius Festus, for the use of the dauphin. His translation of Horace came out the same year. In 1691 he published his translation of the reflections of Marcus Antoninus; and the next year Aristotle's Poetics. For his services to literature he was appointed perpetual secretary to the academy, rewarded with a pension of 2000 livres, and made keeper of the cabinet of the Louvre. He died in 1722. Dacier and his wife renounced the Protestant religion in 1685. Besides the works abovementioned, he translated the works of Plato into French; the Lives of Plutarch; the Manual of Epictetus; &c.

DACIER, ANNE, wife of the preceding, and daughter of Le Fevre, professor of Greek at Saumur, where she was born in 1651. Her father discovering her turn for learning, gave her a liberal education. In 1674 she published an edition of Callimachus, which gave

gave so much satisfaction, that she was employed to prepare editions of Latin authors for the dauphin, the first of which was Florus. In 1681 she published a translation of Anacreon and Sappho, which was followed by versions of some of Plautus's comedies, and of the Plutus and Clouds of Aristophanes. In 1683 she married M. Dacier, and soon after they renounced the Protestant religion. In 1711 appeared her translation of the Iliad; and in 1714 she defended Homer against M. de la Motte, in a book, entitled *The Causes of the Corruption of Taste*; this was followed in 1716 by another against father Hardouin. The same year was printed her version of the Odyssey, which closed her literary labours. She died in 1720. She had two daughters and a son. One of the daughters became a nun, the other died at the age of 18, and the son when he was a child. Madame Dacier was as remarkable for her modesty as her erudition. A learned German having paid her a visit, begged that she would write her name and a sentence in his book. She excused herself as long as she could, but being strongly importuned she complied, and added to her signature a verse from Sophocles, importing that silence is the ornament of the female sex.

DACRYDIUM, in pharmacy, the juice of scamony, prepared and hardened in a quince made hollow; called also *Lachrymula*.

DACRYODES, or **DACRYOIDES**, [from *δάκρυον*, a tear, and *εἶδος*, form,] a name given to ulcers, which continually yield a putrid matter, resembling tears.

DACTYLE, [*δάκτυλος*, a finger,] a poetical foot consisting of one long syllable and two short, like the joints of a finger; as *cādidūs, us pārit*. The dactyle is said to be the invention of Dionysius or Bacchus, who delivered oracles in this measure at Delphos, before Apollo. The Greeks call it *πολιτικός*. The dactyl and spondee are the most considerable of the poetical feet: as being the measures used in heroic verse, by Homer, Virgil, &c. These two are of equal time, but not equal motion. The spondee has an even, strong, and steady pace, like a trot: the dactyl resembles the nimble strokes of a gallop.

DACTYLETHRA, or **DACTYLITHRA**, **DIGITALE**, a medicine used by the ancient physicians, to excite vomiting.

DACTYLIC VERSES are hexameter verses, ending in a dactyl instead of a spondee; as *Spondaic Verses* are those which have a spondee in the fifth foot instead of a dactyl. An instance of a dactylic verse occurs in Virgil; *Æn. vi. 33*.

Bis patriæ cecidere manus: quin protinus omniâ.

DACTYLI IDÆI, [*q. d.* the Fingers of Mount Ida,] in Pagan mythology, are personages very differently described by ancient authors. The Cretans paid divine worship to them, as to those who had nursed and brought up the god Jupiter; whence it appears, that they were the same as the Corybantes and Curetes. Nevertheless Strabo makes them different; and says, that the tradition in Phrygia was, that the "Curetes and Corybantes were descended from the Dactyli Idæi: that there were originally 100 men in the island, who were called Dactyli Idæi; from whom sprang nine Curetes, and each of these nine produced ten men, as many as the fingers of a man's two hands: and that this gave the name to the ancestors of the Dactyli Idæi." He relates another opinion, which is, that there were but five Dactyli Idæi; who, according to Sophocles, were the inventors of iron: that these five brothers had five sisters, and that from this number they took the name of fingers of mount Ida, because they were in number ten; and that they worked at the foot of this mountain.

DACTYLIOMANCY, or **DACTYLIOMANTIA**, [from *δάκτυλος*, a ring, and *μαντεία*, divination,] a sort of divination performed by means of a ring. It consisted in holding a ring, suspended by a fine thread, over a round table, on the edge whereof were made divers marks with the letters of the alphabet. The ring in shaking, or vibrating over the table, stopped over certain of the letters, which, being joined together, composed the answer required.

DACTYLIS, **Cock's-Foot GRASS**, a genus of the digynia order, and triandria class of plants; natural order, Gramina. Calyx bivalved, compressed, with the one valve longer than the other, carinated, or having the rachis prominent and sharp. There are seven species.

DACTYLOGY, [from *δάκτυλος*, a finger, and *λόγος*, a discourse,] the art of communicating our thoughts by signs made by the fingers.

DACTYLONOMIA, or **DACTYLONOMY**, [from *δάκτυλος*, and *νόμος*, a rule,] the art of numbering by the fingers. The rule is this: The left thumb is reckoned one; the index or fore-finger two; and so on to the right thumb, which stands for the cypher.

DACTYLUS, in antiquity, a dance among the Greeks, chiefly performed, Hesihius observes, by the athletes.

DACTYLUS, in poetry. See **DACTYLE**.

DADO, [Ital.] in architecture, the plain part between the base and cornice of a column: the *dye*.

DADUCHI, [*αἱ δαδυχίαι*, torch-bearers,] in antiquity, priests of Ceres. The goddess having lost her daughter Proserpine, say mythologists, began to make search for her at the beginning of the night. In order to do this in the dark, she lighted a torch, and thus set forth on her travels throughout the world: for which reason she is represented with a lighted torch in her hand. In commemoration of this pretended exploit, it became a custom for the priests, at the feasts and sacrifices of this goddess, to run about in the temple, with torches after this manner; one of them took a lighted torch from off the altar, and holding it with his hand, ran with it to a certain part of the temple, where he gave it to another, saying to him, *Tibi trado*; this second ran after the like manner to another part of temple, and gave it to the third, and so of the rest.

DÆDALA, two festivals in Boeotia; one of them observed in Alalcomenos by the Plataeans in a large grove, where they exposed in the open air pieces of boiled flesh, and carefully observed whether the crows that came to prey upon them directed their flight. All the trees upon which any of these alighted were immediately cut down, and with them statues were made, called *Dædala*, in honour of Dædalus. The other festival was of a more solemn kind. It was celebrated every sixty years by all the cities of Boeotia, as a compensation for the intermission of the smaller festivals, for that number of years, during the exile of the Plataeans.

DÆDALUS, in fabulous history, the son of Eupalamus, descended from Erechtheus king of Athens. He was the most ingenious artist of his age; and to him we are indebted for the invention of the wedge, with many other mechanical instruments, and the sails of ships. He made statues which moved of themselves, and seemed to be endowed with life. Talus his sister's son promised to be as great as himself by the ingenuity of his inventions; and therefore from envy he threw him down from a window and killed him. After this murder, Dædalus, with his son Icarus, fled from Athens to Crete, where Minos gave him a cordial reception. Dædalus made a famous labyrinth for Minos, and assisted Pasiphae the queen, to gratify her unnatural passion for a bull. For this action Dædalus incurred the displeasure of Minos, who ordered him to be confined in the labyrinth which he had constructed. Here he made himself wings with feathers and wax, and carefully fitted them to his body and that of his son, who was the companion of his confinement. They took their flight in the air from Crete; but the heat of the sun melted the wax on the wings of Icarus, whose flight was too high, and he fell into that part of the ocean, which from him has been called the Icarian Sea. The father by a proper management of his wings alighted at Cumæ, where he built a temple to Apollo, and thence directed his course to Sicily, where he was kindly received by Cocalus, who reigned over part of the country.

DÆDIS, [from *δαδύς*, a torch,] in Grecian antiquity, a solemn festival, that lasted three days during which the torches were constantly keep burning.

DÆMON, [*ἃ καὶ ἡ δαίμων*,] a name given by the ancients to certain spirits or genii, which appeared to men, either to do them service or to hurt them. The word is derived (according to Plato, in his *Cratylus*, p. 398. ed. Serrani, vol. i.) from *δαίμων*, knowing or intelligent: but according to others from *δαίωμαι*, to distribute. Either of these derivations agree with the office ascribed to dæmons by the ancient heathens, as the spirit entrusted with the inspection and government of mankind. For, according to the philosophers, dæmons held a middle rank between the celestial gods and men on earth, and carried on all intercourse between them; conveying the addresses of men to the gods, and the divine benefits to men. It was the opinion of many, that the celestial divinities did not themselves interpose in human affairs, but committed the entire administration of the government of this lower world to these sub-

altern deities. Hence they became the objects of idolatrous worship. Hesiod and other poets, who have recorded the ancient history of traditions, on which the public faith and worship were founded, assert, that the men of the golden age, who were supposed to be very good, became daemons after death, and dispensers of good things to mankind. Though daemon is often used in a general sense, as equivalent to a deity, and is accordingly applied to fate or fortune, or whatever else was regarded as a god; yet these daemons who were the more immediate objects of worship amongst the heathens were human spirits; as is shewn by Farmer on Miracles, chap. iii. sect. 2. The word daemon is used indifferently in a good and in a bad sense. In the former sense, it was very commonly used among the ancient heathens. But they are mistaken who affirm, that daemon never signified an evil being till after the time of Christ. Pythagoras held that daemons sent diseases to men and cattle. (Diogen. Laert. Vit. Pythag.) Zaleucus, in his preface to his Laws, supposes that an evil daemon might be present with a man, to influence him to justice. The daemons of Empedocles were evil spirits, and exiles from heaven. And Plutarch in his life of Dion says, "It was the opinion of the ancients, that evil and mischievous daemons, out of envy and hatred to good men, oppose whatever they do." Scarce did any opinion more generally prevail in ancient times than this, viz. that as the departed souls of good men became good daemons, so the departed souls of bad men became evil daemons. It has been generally thought, that by daemons we are to understand devils, in the Septuagint version of the Old Testament. Others think the word is in that version applied to the ghosts of such dead men as the heathens deified. That daemon often bears the same meaning in the New Testament, and particularly in Acts xvii. 18. 1 Cor. x. 21. 1 Tim. iv. 1. Rev. ix. 20. is shewn at large by Mr. Joseph Mede. (See his Works. p. 625. et seq.) That the word is applied always to human spirits in the New Testament, Mr. Farmer has attempted to shew in his Essay on Demoniacs, p. 208, et seq. As to the meaning of the word daemon in the fathers of the Christian church, it is used by them in the same sense as it was by the heathen philosophers, especially the latter Platonists; that is, sometimes for departed human spirits, and at other times for such spirits as had never inhabited human bodies. In the fathers indeed the word is more commonly taken in an evil sense, than in the ancient philosophers. Besides the two forementioned kinds of daemons, the fathers, as well as the ancient philosophers, held a third, viz. such as sprang from the congress of superior beings with the daughters of men. In the theology of the fathers, these were the worst kind of daemons. Different orders of daemons had different stations and employments assigned them by the ancients. Good daemons were considered as the authors of good to mankind; evil daemons brought innumerable evils both upon men and beasts. Amongst evil daemons there was a great distinction with respect to the offices assigned them; some compelled men to wickedness, others stimulated them to madness. See DEMONIAIC.

DEMONES, among ancient medical authors, diseases, which could not be assigned to any natural cause, and proceeded, or were supposed to proceed, from the influence or possession of the devil. See DEMONIAIC.

DEMONIAIC, [from *daemon*,] a human being whose volition and other mental faculties are overpowered and restrained, and his body possessed and actuated, by some created spiritual being of superior power. The Greeks and Romans imagined, that their deities, to reveal future events, frequently entered into the prophet or prophetess who was consulted, overpowered their faculties, and uttered responses with their organs of speech. Apollo was believed to enter into the Pythoness, and to dictate the prophetic answers received by those who consulted her. Other oracles besides that of Delphi were supposed to unfold futurity by the same machinery. And in various other cases, either malignant daemons or benevolent deities were thought to enter into and to actuate human beings. The Lymphatici, the Cerriti, the Larvati, of the Romans, were all of this description; and the Greeks, by the use of the word *δαίμονες*, shew that they referred to this cause the origin of madness. Among the ancient heathens, therefore, it appears to have been a generally received opinion, that superior beings entered occasionally into men, overpowered the faculties of their minds, and actuated their bodily organs.

DEMONIAIC, ARGUMENTS AGAINST THE EXISTENCE OF. Those who are unwilling to allow that angels or devils have ever intermed-

dled with the concerns of human life, urge a number of specious arguments. The Greeks and Romans of old, say they, did believe in the reality of demoniacal possession. They supposed that spiritual beings did at times enter into the sons or daughters of men, and distinguish themselves in that situation by capricious freaks, deeds of wanton mischief, or prophetic enunciations. But in the instances in which they supposed this to happen, it is evident that no such thing took place. Their accounts of the state and conduct of those persons whom they believed to be possessed in this supernatural manner, shew plainly that what they ascribed to the influence of daemons were merely the effects of natural diseases. Whatever they relate concerning the larvati, the cerriti, and the lymphatici, shews that these were merely people disordered in mind, in the same unfortunate situation with those madmen and idiots and melancholy persons whom we have among ourselves. Festus describes the Larvati as being furiosi et mentemoti. Plato, in his Timæus, says, *δαίς γὰρ ἐννοῦς ἐρᾷπλεται μαντικῆς* — *ἀληθῆς*. Lucian describes demoniacs as lunatic, and as starting with their eyes, foaming at the mouth, and being speechless. It appears still more evidently, that all the persons spoken of as possessed with devils in the New Testament, were either mad or epileptic, and precisely in the same condition with the madmen and epileptics of modern times. The Jews, among other reproaches which they threw out against our Saviour, said, "He hath a devil, and is mad; why hear ye him?" The expressions he hath a devil, and is mad, were certainly used on this occasion as synonymous. With all their virulence, they would not surely ascribe to him at once two things that were inconsistent and contradictory. Those who thought more favourably of the character of Jesus, asserted concerning his discourses, in reply to his adversaries, These are not the words of him that hath a daemon; meaning, no doubt, that he spoke in a more rational manner than a madman could be expected to speak. The Jews appear to have ascribed to the influence of daemons, not only that species of madness in which the patient is raving and furious, but also melancholy madness. Of John, who secluded himself from intercourse with the world, and was distinguished for abstinence and acts of mortification, they said, He hath a daemon. The youth, whose father applied to Jesus to free him from an evil spirit, describing his unhappy condition in these words, "Have mercy on my son for he is lunatic, and sore vexed with a daemon: for oft-times he falleth into the fire, and oft into the water," was plainly epileptic. Every thing indeed that is related in the New Testament concerning demoniacs, proves that they were people affected with such natural diseases as are far from being uncommon among mankind in the present age. When the symptoms of disorders cured by our Saviour and his apostles as cases of demoniacal possession, correspond so exactly with those of diseases well known as natural in the present age, it would be absurd to impute them to a supernatural cause. It is much more consistent with common sense and sound philosophy to suppose, that our Saviour and his apostles wisely, and with that condescension to the weakness and prejudices of those with whom they conversed, which so eminently distinguished the character of the author of our holy religion, and must always be a prominent feature in the character of the true Christian, adopted the vulgar language in speaking of those unfortunate persons who were groundlessly imagined to be possessed with daemons, though they well knew the notions which had given rise to such modes of expression to be ill-founded, than to imagine that diseases which arise at present from natural causes, were produced in days of old by the intervention of daemons, or that evil spirits still continue to enter into mankind in all cases of madness, melancholy, or epilepsy. Besides, it is by no means a sufficient reason for receiving any doctrine as true, that it has been generally received through the world. Error, like an epidemical disease, is communicated from one to another. In certain circumstances too, the influence of imagination predominates, and restrains the exertions of reason. Many false opinions have extended their influence through a very wide circle, and maintained it long. On every such occasion as the present, therefore it becomes us to enquire, not so much how generally any opinion has been received, or how long it has prevailed, as from what cause it has originated, and on what evidence it rests. When we contemplate the frame of nature, we behold a grand and beautiful simplicity prevailing through the whole. Notwithstanding its immense extent, and though it contains such numberless diversities of being: yet the simplest

simplest machine constructed by human art does not display greater simplicity, or an happier connection of parts. We may therefore infer, by analogy, from what is observable of the order of nature in general to the present case; that to permit evil spirits to inter-meddle with the concerns of human life, would be to break through that order which the Deity appears to have established through his works; it would be to introduce a degree of confusion unworthy of the wisdom of Divine Providence.

DÆMONIACS, ARGUMENTS FOR THE EXISTENCE OF. In opposition to these arguments the following are urged by the Dæmonianists. In the days of our Saviour, it would appear that dæmoniacal possession was very frequent among the Jews and the neighbouring nations. Many were the evil spirits whom Jesus is related in the gospels to have ejected from patients that were brought unto him as possessed and tormented by those malevolent dæmons. His apostles too, and the first Christians, who were most active and successful in the propagation of Christianity, appear to have often exerted the miraculous powers with which they were endowed on similar occasions. The dæmons displayed a degree of knowledge and malevolence which sufficiently distinguish them from human beings: and the language in which the dæmoniacs are mentioned, and the actions and sentiments ascribed to them in the New Testament, shew that our Saviour and his apostles did not consider the idea of dæmoniacal possession as being merely a vulgar error concerning the origin of a disease or diseases produced by natural causes. The more enlightened cannot always avoid the use of metaphorical modes of expression; which though founded upon error, yet have been so established in language by the influence of custom, that they cannot be suddenly dismissed. But in descriptions of characters, in the narration of facts, and in the laying down of systems of doctrine, we require different rules to be observed. Should any person, in compliance with popular opinions, talk in serious language of the existence, dispositions, declarations, and actions, of a race of beings whom he knew to be absolutely fabulous, we surely could not praise him for integrity; we must suppose him to be either exulting in irony over the weak credulity of those around him, or taking advantage of their weakness, with the dishonesty and the selfish views of an impostor. And if he himself should pretend to any connection with this imaginary system of beings; and should claim in consequence of his connection with them, particular honours from his contemporaries; whatever might be the dignity of his character in all other respects, nobody could hesitate to brand him as an impostor. In this light must we regard the conduct of our Saviour and his apostles, if the idea of dæmoniacal possession were to be considered merely as a vulgar error. They talked and acted as if they believed that evil spirits had actually entered into those who were brought to them as possessed with devils, and as if those spirits had been actually expelled by their authority out of the unhappy persons whom they had possessed. They demanded too, to have their possessions and declarations believed, in consequence of their performing such mighty works, and having thus triumphed over the powers of hell. The reality of dæmoniacal possession stands upon the same evidence with the gospel system in general. Nor is there any thing unreasonable in this doctrine. It does not appear to contradict those ideas, which the general appearances of nature and the series of events, suggest, concerning the benevolence and wisdom of the Deity, by which he regulates the affairs of the universe. We often fancy ourselves able to comprehend things to which our understanding is wholly inadequate: we persuade ourselves, at times, that the whole extent of the works of the Deity must be well known to us, and that his designs must always be such as we can fathom. We are then ready, whenever any difficulty arises to us, in considering the conduct of Providence, to model things according to our own ideas; to deny that the Deity can possibly be the author of things which we cannot reconcile; and to assert, that he must act on every occasion in a manner consistent with our narrow views. This is the pride of reason; and it seems to have suggested the strongest objections that have been at any time urged against the reality of dæmoniacal possession. But the Deity may surely connect one order of his creatures with another. We perceive mutual relations and a beautiful connection to prevail through all that part of nature which falls within the sphere of our observation. The inferior animals are connected with mankind, and subjected to their authority, not

only in instances in which it is exerted for their advantage, but even where it is tyrannically abused to their destruction. Among the evil to which mankind have been subjected, why might not their being liable to dæmoniacal possession be one? While the Supreme Being retains the sovereignty of the universe, he may employ whatever agents he thinks proper in the execution of his purposes: he may either commission an angel, or let loose a devil; as well as bend the human will, or communicate any particular impulse to matter. All that revelation makes known, all that human reason can conjecture, concerning the existence of various orders of spiritual beings, good and bad, is perfectly consistent with, and even favourable to, the doctrine of dæmoniacal possession. It is mentioned in the New Testament in such language, and such narratives are related concerning it, that the gospels cannot well be regarded in any other light than as pieces of imposture, and Jesus Christ must be considered as a man who took advantage of the weakness and ignorance of his contemporaries, if this doctrine be nothing but a vulgar error; it teaches nothing inconsistent with the general conduct of Providence. In short, it is not the caution of philosophy, but the pride of reason, that suggests objections against this doctrine.

DÆMONIACS, in church history, a branch of the Anabaptists; whose distinguishing tenet is, that the devils shall be saved at the end of the world.

DAFFODIL, in botany. See **NARCISSUS**.

DAGHESTAN, a province of Asia, bounded by Circassia on the N.; by the Caspian sea on the E.; by Schirvan, in Persia, on the S.; and by mount Caucasus and Georgia on the W. Its chief towns are Tarku and Derbent, both situated on the Caspian Sea. It is inhabited by Tartars, who are subject to Russia.

DAGISTAN, a town of Persia, 240 miles N. W. of Meschid.

DAGNO, a town of Turkey in Europe, in Albania, 13 miles S. E. of Scutari.

DAGO, or **DAGHO**, an island in the Baltic Sea, on the coast of Livonia, between the gulf of Finland and Riga.

DAGON, the idol of Ashdod or Azotus. He is commonly represented as a monster, half man and half fish; whence most learned men derive the name from the Hebrew דַּג, *dag*, which signifies "a fish." Those who make him to have been the inventor of bread corn, derive his name from the Hebrew דַּגֵּן, *Dagon*, signifying corn; whence Philo-Biblicus calls him *Ζεύς Ἀπαργεῖος*, *Jupiter Aratrius*. This deity continued to have a temple at Ashdod to the time of the Maccabees: for the author of the first book of Maccabees tells us, that "Jonathan, one of the Maccabees, having beaten the army of Apollonius, Demetrius's general, they fled to Azotus, and entered into Bethdagon (the temple of their idol;) but Jonathan set fire to Azotus, and burnt the temple of Dagon, and all those who were fled into it." Dagon according to some was the same with Jupiter, according to others Saturn or Venus; but according to most Neptune.

DAGYSA, in zoology, a genus of the vermes mollusca. Body loose, nayant, angular, tubular, and open at each extremity. One species, viz. *D. notata*, found in the Spanish sea, is about three inches long and one thick. This genus is very like the *Salpa*, which see.

DAHHLAK, DALAKA, or DALACCA, an island in the Red Sea, near the coast of Abyssinia, about 22 leagues in length, and four in breadth, celebrated for its pearl fishery.

DAHL, or **DAL**, a river of Sweden, which runs through the provinces of Dalecarlia and Gestrícia, and falls into the gulph of Bothnia.

DAHOME, DAHOMY, or DAUMA, a kingdom of Africa, on the coast of Guinea, N. of Whidah. It is said to extend from 150 to 200 miles inland. The soil is rich, and produces all the tropical fruits and vegetables. There is not a stone to be found as large as an egg in this country, so far as Europeans have hitherto travelled.

DAIRI, or **DAIRO**, in Japan, is the sovereign pontiff of the Japanese; or, according to Kämpfer, the hereditary ecclesiastical monarch of Japan.

DAIRY-HOUSE, in rural economy, a place appropriated to the management of milk, butter, cheese, &c. A dairy ought to be so situated, that the windows, or lattices, may never front the south, south-east, or south-west; and it should at all times be kept in the neatest order. Lattices are also far preferable to glazed lights,

lights, as they admit a free circulation of the air. It has, however, been objected, that the former afford access to the cold air of winter, and to the sun in summer; but either may be easily remedied, by making the frame somewhat larger than the lattice, and constructing it so as to slide backward and forward at pleasure. Across this frame, packthread may be stretched, and oiled paper pasted on it, which will thus admit the light, and effectually keep out the sun and wind. During the summer, dairy-houses cannot be kept too cool; they ought therefore to be erected, if possible, near a cold spring, or running water; and, where it is practicable to conduct a small stream through the premises, it will much contribute to the convenience and utility of the place. Dr. Anderson observes, in his practical essay on the management of the dairy (published in the 3d and 4th vols of his ingenious "Recreations in Agriculture," &c.) that, if the water can be introduced by means of a pipe, so as to fall from some height on the floor, it will be productive of many advantages, particularly by preserving a continual freshness and purity of the air. Dairy-houses should therefore be neatly paved, either with red brick, or smooth hard stone, and laid with a proper descent, so that no water may stagnate. This pavement should be well washed every day during the summer; and all the utensils, here employed, be kept with unremitting attention to cleanliness. Nor should the churns be at any time scalded in the dairy; as the steam arising from hot water, tends greatly to injure the milk. For similar reasons, neither the cheese and rennet, nor the cheese-press, must be suffered to taint the atmosphere; as the whey and curd will diffuse their acidity over the whole building. All the utensils of the dairy should be made of wood, in preference either to lead, copper, or cast-iron; for these metals are easily soluble in acids; the solutions of the two first are in a high degree poisonous; and, though the latter is in itself harmless, the taste of it renders the productions of the dairy very disagreeable. The cream-dishes, when perfectly clean and cool, ought to be filled with the milk, as soon as it is drawn from the cow, and has been carefully strained through a cloth, or cloth-sieve made of hair or silver-wire; the latter of which, as Dr. Anderson justly remarks, is more wholesome than those of other metals. These dishes should never exceed three inches in depth, but may be so wide as to contain a gallon and a half of milk—when filled, they ought to be placed on shelves, to remain there till the cream be completely separated. Now it is to be taken off with nicety, by a skimming-dish (without lifting or removing the milk; or shedding any of it on the floor, which would soon corrupt the air of the room), and then deposited in a separate vessel, till a proper quantity be collected for churning. A firm, neat, wooden barrel, which is open at one end, and has a lid closely fitted to it, appears to be well calculated for this purpose; a cock or spigot, ought also to be fixed near the bottom, to draw off the thin, or serous part, that may drain from the cream; and the inner side of the opening should be covered with a piece of fine silver wire-gauze, in order to prevent the latter from escaping, while the former is allowed to pass. But, if notwithstanding the fatal consequences arising from the use of metallic utensils, or of earthen vessels glazed with lead, farmers still persist in employing them, it ought to be a constant and indispensable rule, to scald and scour them properly with salt and water, every day, and to dry them thoroughly, before the milk is deposited in them. Lastly, it is sincerely to be wished, that all the utensils employed in the dairy, of whatever materials they may consist, should be cleaned with similar care, previously to their being used; and, as long as the least acid smell is perceptible, they ought to undergo repeated scourings, till they are completely sweetened.

DAIS, in botany, a genus of the monogynia order, and decandria class of plants, and natural order, Veprecula. Involucrum tetraphyllous; corolla quadrifid, or quinquefid; berry one-seeded. Three species.

DALBERGIA, in botany, a genus of the diadelphia decandria class and order; natural order, Papilionaceæ; or Leguminosæ. Filaments two, four-cleft at top. Fruit pedicelled, not opening, leguminose, membranaceous, compressed. There are two species, viz. *D. lanceolaria* and *D. monetaria*; the former is native of Malabar and Ceylon, the latter of Surinam.

DAISY. See **BELLIS**.

DAKIR, in our statutes, is used for the 20th part of a last of hides. According to the statute of 15 Hen. III. De composi-

tione ponderum & mensurarum, a last of hides consists of 20 dakirs, and every dakir of ten hides. But by 1 Jac. cap. 33, one last of hides or skins is 12 dozen.

DALEA, **DALIA**, or **DAAL**, a province of Sweden bounded on the N. by Dalecarlia, on the E. by the Wermeland and the lake Wenner, on the S. by Gothland, and the W. by Norway and the sea.

DALEBURG, a town in Sweden, capital of Dalia, 50 miles north of Gottenburg.

DALECARLIA, a province of Sweden, bounded on the N. by Hisingland; on the E. by Gestrica; on the S. by Warmland, and on the W. by Norway. It is divided into two parts, which they call valleys; and is about 175 miles in length and 100 in breadth. It is full of mountains, which abound in mines of copper and iron, some of which are of a prodigious depth.

DALECARLIA, a river of Sweden.

DALECHAMPIA, in botany, a genus of the monadelphia order, and monœcia class of plants; natural order, Tricocceæ. Involucrum of the male common, quadripartite; calyces hexaphyllous; corolla none; nectarium laminated or scaly; female involucre common and triphyllous; corolla none; style one; capsule tricocceous. Two species: *D. Scandens*, a climbing plant, native of Jamaica; and *D. Colorata*, found in New Granada.

DALEM, or **DALEN**, a town of France, in the department of Ourte, 5 miles N. E. of Liege.

DALKEITH, a town in Scotland, 6 miles S. E. of Edinburgh.

DALKEY, a small island, in St. George's channel, near the coast of Ireland, a little to the S. of Dublin bay. Lon. 6. 5. W. Lat. 53. 20. N.

DALMANUTHA, in ancient geography, a city of Judæa, on the E. side of the sea of Tiberias, either the same with Magdala, or situated near it. Hence Mark says, (Ch. viii. 10,) that our Saviour and his disciples landed in the parts of Dalmanutha; while Matthew, (xv. 39,) recording the same fact, says that he came into the coasts of Magdala.

DALMATIA, a country of Europe, bounded on the N. by Bosnia and Croatia, on the E. by Servia, and on the S. and W. by the Adriatic. The air is wholesome, and the soil fruitful. It abounds in wine, corn, and oil. Its rivers have no long course, but are mostly navigable. The mountains abound with minerals, and are covered with sheep and black cattle. Gold and silver mines are in some of them.

DALRYMPLE, Sir **DAVID**, of Hailes, Bart. a late eminent and learned judge of Scotland, was born in Edinburgh, Oct. 28, 1726. His father Sir James Dalrymple, Bart. was the son of Sir David, Lord Advocate under K. George I. and grandson of the first earl of Stair. His mother, Lady Christian Hamilton, was daughter of the E. of Hadinton. He was educated at Eton and at Utrecht. In 1748 he was called to the Scotch bar, and in 1766 appointed a judge, on which occasion he took the title of lord Hailes. He died in 1792, leaving two daughters. He published a number of books, as "Memoirs and Letters relating to the History of Britain in the Reigns of James I. and Charles I." in two vols. "Remarks on the History of Scotland," 12mo.; "Annals of Scotland," 4to: 2 vols.; "Remains of Christian Antiquity," 3 vols. several Memoirs intended for a Biographia Scotica; "Papers in the World and Mirror," &c. He has also left many valuable MSS.

DALTON, a town of England in Lancashire. Lon. 30. 0. W. Lat. 54. 18. N.

DAMA, in zoology. See **CERVUS**.

DAMAN, or **DAMAUN**, a sea-port town of the East Indies, at the entrance of the gulph of Cambay. Lon. 72. 25. E. Lat. 20. 20. N.

DAMAR, a town of Arabia, in the country of Oman, 70 miles N. of Oman.

DAMASCENE. See **PRUNUS**.

DAMASCENUS, **JOHN**, an illustrious father of the church in the 8th century, born at Damascus, where his father, though a Christian, enjoyed the office of counsellor of state to the Saracen caliph; to which the son succeeded. He retired afterwards to the monastery of St. Sabas, and spent the remainder of his life in writing books of divinity. His works have been often printed: but the Paris edition in 1712, two vols. folio, is esteemed the best.

DAMASCIUS,

DAMASCIUS, a celebrated heathen philosopher, born at Damascus, A. D. 540, when the Goths reigned in Italy. He wrote the life of his master Isidorus; and dedicated it to Theodora, a very learned and philosophical lady, who had also been a pupil to Isidorus. In this life, which was copiously written, he frequently made oblique attacks on the Christian religion. We have nothing remaining of it but some extracts preserved by Photius. Damascius succeeded Theon in the rhetorical school, and Isidorus in that of philosophy, at Athens.

DAMASCUS, [דמשק, Heb.] a very ancient city of Syria in Asia. Some of the ancients suppose this city to have been built by one Damascus, from whom it took its name; but the most generally received opinion is, that it was founded by Uz the eldest son of Aram. It is certain, from Gen. xiv. 15, that it was in being in Abraham's time, and consequently may be looked upon as one of the most ancient cities in the world. In the time of king David it seems to have been a very considerable place; as the sacred historian tells us, that the Syrians of Damascus sent 20,000 men to the relief of Hadadezer king of Zobah. We are not informed whether at that time it was governed by kings, or was a republic. Afterwards, however, it became a monarchy which proved very troublesome to the kingdom of Israel, and would even have destroyed it entirely, had not the Deity miraculously interposed in its behalf. This monarchy was destroyed by Tiglath-Pileser, king of Assyria, and Damascus was never afterwards governed by its own kings. Notwithstanding the tyranny of the Turkish government, Damascus is still a considerable place. It is situated in a plain of so great extent, that one can but just discern the mountains which compass it on the other side. The fruit-tree called the damascene, and the flower called the damask rose, were transplanted from the gardens belonging to this city; and the silks and linens known by the name of damasks, were probably invented by the inhabitants. Damascus is 112 miles S. of Antioch, 130 N. N. E. of Jerusalem, and 270 S. S. W. of Diarbeck. Lon. 37. 0. E. Lat. 33. 45. N.

DAMASIA, in ancient geography, a town of Vindelicia, on the Licus; afterwards called Augusta; now Augsburg in Suabia.

DAMASK, a silk-stuff, with a raised pattern, so as that the right side of the damask, is that which has the flowers raised or satined. Damasks should be of dressed silk, both in warp and woof; and in France, half an ell in breadth: they are made at Chalons in Champagne, and in some places in Flanders, as at Tournay, &c. entirely of wool, three-eighths of an ell wide, and 20 ells long.

DAMASK is also applied to a very fine steel, in some parts of the Levant, chiefly at Damascus in Syria; whence its name. It is used for sword and cutlass-blades, and is finely tempered.

DAMASKEENING, or **DAMASKING**, the art or operation of beautifying iron, steel, &c. by making incisions therein, and filling them up with gold and silver wire; chiefly used for adorning sword-blades, guards, and grips, locks of pistols, &c.

DAMBEA, or **DEMBEA**, a province of Abyssinia. It is a flat country, and subject to inundations. It is situated N. of Dambea, an extensive lake of Abyssinia, containing many fertile islands, with plenty of fish and river-horses. It is 100 miles from the source of the Nile.

DAMBEA, the capital of Abyssinia, is seated in the above province, at the head of the lake, 320 miles W. of the Red Sea. Lon. 34. 20. E. Lat. 14. 40. N.

DAMEL, or **KAYO**, a country of Africa, on the coast of the Atlantic, between the rivers Senegal and Gambia.

DAMELEN, a town of Germany, in the circle of Upper Saxony, and Middle Mark of Brandenburg, 6 miles W. of Belitz.

DAMIANISTS, in church history, a branch of the ancient Acephali Severita. They agreed with the Catholics in admitting the sixth council, but disowned any distinction of persons in the Godhead; and professed one single nature, incapable of any difference: yet they called God "the Father, Son, and Holy Ghost."

DAMIANO, Str. a town of Italy in Montserrat, 18 miles W. by N. of Vercelli.

DAMICOTTA, a town of Hindostan, in the Coimbatore

country, 30 miles N. of Coimbatore, and 60 miles S. of Seringapatam.

DAMIETTA, a port town of Egypt, situated on the E. mouth of the Nile, four miles from the sea-coast. The present town stands upon a different site from the ancient Damietta so repeatedly attacked by the European princes. The latter, according to Abulfeda, was a "town surrounded by walls, and situated at the mouth of the eastern branch of the Nile." The present Damietta is rounded in a semicircle on the E. bank of the Nile, 7½ miles from the mouth of it. Lon. 31. 50. E. Lat. 31. 15. N.

DAMM, a town of Germany, in Upper Saxony, and duchy of Pomerania, 5 miles E. of Stettin.

DAMME, a town of Holland, in Groningen, on the river Damster.

DAMNII, an ancient people of Britain, who inhabited the district, situated between the territories of the Selgovæ on the S. and the Caledonii on the N. now called Clydesdale.

DAMOCLES, one of the flatterers of Dionysius the Elder of Sicily. He admired the tyrant's wealth, and pronounced him the happiest man on earth. Dionysius prevailed upon him to undertake for a while the charge of royalty, and be convinced of the happiness which a sovereign enjoyed. Damocles ascended the throne, and while he gazed upon the wealth and splendor that surrounded him, he perceived a sword hanging over his head by a single horse-hair. This so terrified him that all his imaginary felicity vanished at once; and he begged Dionysius to remove him from a situation which exposed his life to such fears and dangers.

DAMON and **PYTHIAS**, two illustrious friends of antiquity, who have immortalized their names, by the strength and sincerity of their friendship. Damon was a Pythagorean philosopher, who, having incurred the displeasure of Dionysius, tyrant of Syracuse, was condemned to death. Whereupon he required a short respite till he should settle some domestic business of the utmost importance to his family, but which required his personal presence at some distance from Syracuse. Dionysius agreed to grant his request, but upon a condition, which he supposed impossible to be complied with; viz. that Damon should find some person who was willing to suffer death in his stead, provided he did not return at the time appointed. Pythias, to the surprise of the tyrant, cheerfully surrendered himself as a pledge for his friend Damon; who, after his settling business, astonished the tyrant still more by returning punctually at the hour fixed for his execution. Dionysius was so struck with the fidelity of those two friends, that he remitted the punishment, and intreated them to permit him to share their friendship, and enjoy their confidence. See an elegant embellishment of this piece of ancient history, in Brookes's "Fool of Quality."

DAMOT, a province of Abyssinia, situated in the S. W. part of that empire, about 40 miles long from N. to S. and 20 broad from E. to W.

DAMPS, in natural history, are certain noxious exhalations issuing from some parts of the earth, and which prove almost instantly fatal to those who breathe them. These damps are chiefly observed in mines and coal-pits, though vapours of the same kind often issue from old lavas of burning mountains; and in those countries where volcanoes are common, will frequently enter houses, and kill people suddenly without the least warning of their approach. See GAS.

DAMPIER, WILLIAM, a famous navigator, descended from a respectable family in Somersetshire, and born in 1652. Losing his father when very young, he was sent to the sea, where he soon distinguished himself, particularly in the South Sea. His voyage round the world is well known, and has gone through many editions. He appears afterward to have engaged in an expedition concerted by the merchants of Bristol to the South Sea, commanded by Captain Woods Rogers; who sailed in August 1768, and returned in Sept. 1711: but no farther particulars of his life or death are recorded.

DAMSON TREE. See PRUNUS.

DAMSONG, a town of Asia, in the country of Bootan, 54 miles S. W. of Tassasudon.

DAMVILLIERS, a town of France, in the department of Meuse, 11 miles N. of Verdun.

DAN, [דן, Heb. i. e. judgement,] one of the twelve patriarchs,

triarchs, the fifth son of Jacob, and the eldest by Bilhah. Of his history nothing is recorded, except that he had but one son named Hushim; though his posterity was afterwards very numerous.

DAN, or, **THE DANITES**, one of the twelve tribes of Israel, descended from the patriarch Dan. Their number, at the emigration from Egypt, amounted to 62,700, and in the wilderness they increased to 64,400. After their settlement in Canaan, a party of them, who went to take Laish, in their way robbed Micah the Ephraimite of his idol, which they continued to worship till they were carried captive by Tiglath-Pileser. Samson, the heroic judge of Israel, was of this tribe; and 28,600 of them attended at David's coronation. The Danites appear to have been early acquainted with commerce, for they had ships in the time of Jabin, king of the Canaanites. See Judges v. 17. The territory of the Danites extended W. of Judah, and was terminated by Azotus and Dora on the Mediterranean.

DAN, in ancient geography, a city of the Danites, situated on the E. side of the springs of Jordan, which was so named from the tribe, and on the S. of Mount Lebanon. It was early built by the Canaanites, and originally named Laish or Lesheim; till 600 of the Danites took it, and named it after their progenitor. This city and Beersheba were the two extremities of the kingdom of Israel; where Jeroboam established idolatry by setting up his golden calves. It was taken and pillaged by Benhadad king of Syria; notwithstanding which it made some figure after the captivity.

DANAE, in antiquity, a coin somewhat more than an obolus, used to be put into the mouths of the dead, to pay their passage over the river Acheron.

DANAE, in fabulous history, the daughter of Acrisius king of Argos, by Eurydice. She was confined in a brazen tower by her father, who had been told by an oracle that his daughter's son would put himself to death. But Jupiter, who was enamoured of Danae, introduced him to her bed by changing himself into a shower of gold. From his embraces Danae had a son, with whom she was exposed to the sea by her father. The wind drove the bark which carried her to the coasts of the island of Seriphus; where she was saved by some fishermen, and carried to Polydectes king of the place, whose brother, Dictys, educated the child, who was named Perseus, and tenderly treated the mother. Polydectes fell in love with her; but being afraid of her son, he sent him to conquer the Gorgons, pretending that he wished Medusa's head to adorn his nuptials with Hippodamia the daughter of Ctenomans. When Perseus had victoriously finished his expedition, he retired to Argos with Danae to the house of Acrisius, whom he inadvertently killed. Virgil says that Danae after this came to Italy, and founded the city of Ardea. See **ARDEA**. Some suppose that it was Proetus, the brother of Acrisius, who introduced himself to Danae in the brazen tower; but whoever was her seducer, the fable of the golden shower plainly implies that the keepers of the tower were bribed. Against such showers, indeed, towers of brass, and bars of iron, are no defence. As to Jupiter, a certain poet justly remarks,

"But what though these things tradition but jests?

"What is fabled of Jove may be true of his priests."

DANEA, in botany, a genus of the cryptogamia filices class and order: fructification oblong, linear, transversely immersed in the front, parallel, many-celled; cells in a double row, opening upwards; seeds numerous, very minute. There are two species, viz. the nodosa and alata.

DANAIDES, in fabulous history, the fifty daughters of Danaus king of Argos. When their uncle Egyptus came from Egypt with his fifty sons, they were promised in marriage to their cousins; but before the celebration of their nuptials, Danaus, who had been informed by an oracle that he was to be killed by the hands of one of his sons-in-law, made his daughters solemnly promise that they would destroy their husbands. They were provided with daggers, and all except Hypermnestra proved but too obedient to their father's bloody injunctions, as a proof of which they presented him with the heads of their murdered husbands, on the morning after their nuptials. Hypermnestra was summoned to appear and answer for her disobedience in suffering her husband Lynceus to escape; but the unanimous voice of the people declared her innocent, and she dedicated a temple to the goddess

of Persuasion. The 49 sisters were condemned to hell, to fill with water a vessel full of holes, so that their labour was infinite, and their punishment eternal.

DANAUS, in fabulous history, a son of Belus and Anchinoe, who after his father's death reigned conjointly with his brother Egyptus on the throne of Egypt. Some time after, a difference arose between the brothers, and Danaus set sail with his 50 daughters in quest of a settlement.

DANCE, or **DANCING**, a movement of the body, performed according to rule, and adjusted to the measures of music, either sung or played. However, dancing in a general sense is applied to certain anomalous motions of the body. Dancing was by the ancients divided into cubistic, spheristic, and orchestric: the cubistic dance was performed with certain wrestlings and contortions of the body; the spheristic with a sort of ball, or bowl play; but the orchestric was most usual, and what indeed was dancing properly so called. Dancing is usually an effect and indication of joy, though Mr. Palleprat assures us, that there are nations in South America, who dance, to shew their sorrow. It has been in use among all nations civilized and barbarous, though held in esteem among some, and in contempt among others. It has often been, and still is, sometimes, made an act of religion. Thus David danced before the ark to honour God, and express his excess of joy for its return into Zion. Among the Pagans it made a part of the worship paid to the gods, it being usual to dance round the altars and statues; and at Rome, the salii, who were priests of Mars, danced through the streets in honour of that god. The poets made the gods themselves dance. The Christians are not free from this superstition, for in popish countries certain festivals, particularly those of the sacrament, and passion of our Lord, are celebrated with dancing. Sudden joy seems to be the general, and almost the only natural, stimulus to dancing, according to the general sense of the term; but that it should naturally incite the mind, to direct the motions of the body according to the measures of music, we can by no means conceive. This seems to be a refinement which puts a restraint upon nature, and in some cases is carried to such excess as to be truly scandalous. Violent dancing, especially in the heated atmosphere of a crowded assembly, produces a temporary fever, even in the bye-standers, who inspire an air exceedingly vitiated by the breath of persons apparently in a semi-delirious trance, and by the suffocating vapour of candles. The blood is unnaturally propelled to the breast and head—hence arise frequent colds, coughs, and periodical head-achs; perspiration is wantonly checked; the lungs are forcibly expanded, and the foundation is laid for that avenging disease, consumption, which spares neither rank, age, nor sex, and often exterminates whole families.

DANCETTE, in heraldry, is when the outline of any bordure, or ordinary, is indented very largely, the largeness of the indentures being the only thing that distinguishes it from indented.

DANDA, a province and river of Angola.

DANDAR, a circar of Hindostan, in the country of Guzerat.

DANDELION, in botany. See **LEONTODON**.

DANEGLT, a tax, or tribute on every hide of land, imposed on our ancestors the Saxons, by the Danes, on their frequent invasions, as the arbitrary terms of peace and departure. It was first imposed as a continual yearly tax upon the whole nation, under King Ethelred. It was levied by William I. and II. but was released by Henry I. and finally abolished by King Stephen. No church, or church-land paid the danegelt, because, as is set forth in the ancient Saxon law, the people of England placed more confidence in the prayers of the church, than in any military defence they could make.

DANICHA, a town of Russia, in the government of Tobolsk, on the Chatanga.

DANIEL, [דניאל, Heb. i. e. my judge is God,] the fourth of the greater prophets, was born in Judea of the tribe of Judah, about the 25th year of the reign of Josiah; A. M. 3398. He was led captive to Babylon, with other young Hebrew lords, after the taking of Jerusalem by Nebuchadnezzar, who took them into his service. That prince gave them masters to instruct them in the language and sciences of the Chaldeans, and ordered them to be fed with the most delicate viands; but they, fearing that they should eat meat forbidden by the law of Moses, desired the king's officers

officers to allow them only pulse. The wisdom and conduct of Daniel pleasing Nebuchadnezzar, that monarch gave him several posts of honour. He explained Nebuchadnezzar's dream of the mysterious statue, which foretold the four great monarchies on which account he was made prefect of the province of Babylon. He afterwards explained that monarch's other dream, which foretold his lunacy. In the reign of Darius the Mede, he refused to obey the wicked decree of the king, and was cast into the lion's den, when those beasts, though pinched with hunger, did him no hurt. And he explained the characters written on the wall of the room where Belshazzar was feasting. It is believed that Daniel died in Chaldea, and that he did not take advantage of the permission granted by Cyrus to the Jews of returning to their own country. St. Epiphanius says he died at Babylon; and herein he is followed by the generality of historians. The prophecies of Daniel concerning the coming of the Messiah, and the other great events of after-times, are so clear and explicit, that, as St. Jerom tells us, Porphyry objected to them, that those which related to the kings of Syria and Egypt, chap. xi. must have been written after the times of Antiochus Epiphanes; whereas this prophecy was translated into Greek 100 years before his time, and the translation was in the hands of the Egyptians, who had no great kindness for the Jews and their religion. Josephus says, the prophecies foretelling the successes of Alexander, chaps. viii. 5. xi. 3. were shewn to him by the Jews, in consequence of which they obtained several privileges from him; (Antiq. lib. xi. c. 8.) The style of Daniel is not so lofty and figurative as that of the other prophets; but it is more clear and concise, and his narrations and descriptions are simple and natural: in short, he writes more like a historian than a prophet. The first six chapters of the book of Daniel are a history of the kings of Babylon, and what befel the Jews under their government. In the last six he is altogether prophetic, foretelling not only what should happen to his own church and nation, but events in which foreign princes and kingdoms were concerned; some of which now are evidently fulfilling; See Dan. vii. 11; 26.

DANIEL, GABRIEL, a celebrated Jesuit, and one of the best French historians, was born at Rouen in 1649. He taught polite literature, philosophy, and divinity, among the Jesuits; and was superior of their house at Paris, where he died in 1728. There are a great number of his works published in French, of which the principal are, 1. An History of France, of which he also wrote an abridgment, in 9 vols. 12mo. 2. An History of the French Militia, in 2 vols. 4to. 3. An Answer to the Provincial Letters. 4. A Voyage to the World of Descartes. 5. Letters on the Doctrines of the Theorists, and on Probability. 6. New Difficulties relating to the Knowledge of Brutes; And, 7. A theological Treatise on the Efficacy of Grace.

DANKALI, or DANCALI, a kingdom of Abyssinia, lying along the coast of the Red Sea.

DANMONII, an ancient British nation, supposed to have inhabited the tract of country, now called Cornwall and Devonshire, bounded on the S. by the British Ocean, on the W. by St. George's Channel, on the N. by the Severn Sea, and on the E. by the country of the Durotriges.

DANNENBERG, DANNEBERG, or DANEBURG, a county of Germany, in the late circle of Lower Saxony, and Lunenburg.

DANNENBERG, a town in the above county, seated on the Jetze; near the Elbe.

DANTE, JOHN BAPTIST, a native of Perugia, and an excellent mathematician, called the new Dædalus, for the wings he made himself, and with which he flew several times over the lake Thrasy-menus. He fell in one of his enterprises; the iron work with which he managed one of his wings having failed; by which accident he broke his thigh: but it was set by the surgeons, and he was afterwards called to Venice to profess mathematics.

DANTZICK, or DANTZIG, the capital of the late Polish Prussia, is seated on a branch of the Vistula, about four miles above where it falls into the Baltic. It is 68 miles W.S.W. of Königsberg. Lon. 18. 40. E. Lat. 54. 22. N.

DANUBE, the largest and most considerable river in Europe, rising in the Black Forest, near Zunberg; and running N.E. through Swabia by Ulm, the capital of that country; then running E. through Bassaria and Austria, passes by Ratisbon, Passau,

Ens, and Vienna. It then enters Hungary, and runs S.E. from Presburg to Buda, and so on to Belgrade; after which it divides Bulgaria from Morlachia and Moldavia, discharging itself by several channels into the Black Sea, in the province of Bessarabia. Towards the mouth, it was called the Ister by the ancients; and it is now said, that four of the mouths are choked up with sand, and that there are only two remaining. It begins to be navigable for boats at Ulm, and receives several large rivers as it passes along. It is so deep between Buda and Belgrade, that the Turks and Christians have had men of war upon it; and yet it is not navigable to the Black Sea, on account of the cataracts. The Danube was generally supposed to be the northern boundary of the Roman empire in Europe. It was worshipped as a deity by the Scythians.

DANVILLE, a town of Kentucky, in Mercer county, pleasantly situated in a large, fertile plain, on the SW. side of Dick's river, 35 miles S.S.W. of Lexington.

DAPHNE, in ancient geography, a small district on the lake Samachonitis, in the Higher Galilee, very pleasant and plentifully watered with springs, which feed the Lesser Jordan.

DAPHNE, SPURGE LAUREL, a genus of the monogynia order, and octandria class of plants; natural order, Vepreculæ. No calyx; corolla quadrifid, marcescent, inclosing the stamina; berry one-seeded. There are 28 species, shrubs about five feet high.

D. MEZEREUM, the **MEZEREON**, or **SPURGE OLIVE**, is a low deciduous shrub. It is a native of Germany, and has also been discovered in some woods near Andover in Hampshire. Of this elegant plant there are four varieties: 1. The white: 2. The pale red: 3. The crimson: and 4. The purple flowering.—Hanbury says, "these shrubs have every perfection to recommend them as flowering shrubs. 1. They are of low growth, seldom arising to more than three or four feet in height, and therefore are proper even for the smallest gardens. 2. They will be in bloom when few trees, especially of the shrubby tribe, present their honours. It will be in February, nay, sometimes in January; then will the twigs be garnished with flowers all around from one end to the other. Each twig has the appearance of a spike of flowers of the most consummate lustre; and whether beheld near or at a distance, it has a most enchanting appearance. The sense of smelling is peculiarly regaled by the flowers; their spicy sweetness is diffused around, and the air is perfumed with their odours to a considerable distance. Besides the beauty of the leaves, which come out after the flowers are fallen, and which are of a pleasant green colour and an oblong figure, it will be full of red berries in June, which will continue growing till the autumn. Of these berries the birds are very fond; so that whoever is delighted with those songsters, should have a quantity of them planted all over the outskirt of his wilderness quarters." The root of the mezereon was long used in the Lisbon diet-drink, a remedy said to be good for several complaints, particularly nodes and other symptoms resisting the use of mercury. The composition of this diet-drink is described in the Edinburgh Physical Essays, by Dr. Donald Monro of London. On chewing the root it proves very pungent, and its acrimony is accumulated about the fauces, and is very durable. It is employed chiefly under the form of decoction; and it enters the decoctum sarsaparillæ compositum of the London college; but it has also been used in powder combined with some inactive one, as that of liquorice root. It is apt to occasion vomiting and purging; so must be begun in grain doses, and gradually increased. It is often usefully combined with mercury. The bark of the root, which is the most acrimonious part, is recommended in the pharmacopœia chirurgica, to be steeped in vinegar, and applied to promote the discharge of issues. Mezereon has also been of use in tumours and cutaneous eruptions not venereal. The whole plant is very corrosive; and six of the berries, it is said, will kill a wolf. A woman gave 12 grains of the berries to her daughter who had a quartan ague; she vomited blood, and died immediately.

DAPHNE, in the Pagan mythology, a daughter of the river Peneus by the goddess Terra, of whom Apollo became enamoured. This passion had been raised by Cupid; with whom Apollo, proud of his late conquest of the serpent Python, had disputed the power of his darts. Daphne heard with horror his addresses, and endeavoured to avoid his importunities by flight. Apollo pursued her, and Daphne intreated the assistance of the gods, who changed,

changed her into a laurel. Apollo crowned his head with the leaves of the laurel, and for ever ordered that that tree should be sacred to his divinity.

DAPHNE, a daughter of Tiresias, priestess in the temple of Delphi. She was consecrated to the service of Apollo by the Epigoni, or according to others by the goddess Tellus. She was called Sibyl on account of the wildness of her looks and expressions when she delivered oracles.

DAPHNEPHAGI, [*οἱ καὶ αἱ δαφνιφάγοι*, from *δάφνη*, laurel, and *φάγω*, to eat,] in antiquity, enthusiasts, who pretended to be inspired, after eating leaves of laurel.

DAPHNEPHORIA, a festival in honour of Apollo, celebrated every ninth year by the Bœotians. It was then usual to adorn an olive-bough with garlands of laurel and other flowers, and place on the top a brazen globe, on which were suspended smaller ones. In the middle were placed a number of crowns and a globe of inferior size, and the bottom was adorned with a saffron-coloured garment. The globe on the top represented the sun or Apollo. That in the middle was an emblem of the moon, and the other of the stars. The crowns, which were 365 in number, represented the sun's annual revolution. This bough was carried in solemn procession by a beautiful youth of an illustrious family, and whose parents were both living. The youth was dressed in rich garments which reached to the ground, his hair hung loose and dishevelled, his head was covered with a golden crown, and he wore on his feet shoes called Iphicratide, from Iphicrates an Athenian, who first invented them. He was called *Δαφνιφόρος*, Daphnephorus, laurel-bearer; and at the time executed the office of priest of Apollo.

DAPPLE-BAY, in the manege, an epithet applied to bay horses that have marks of a dark bay.

DAPPLE-BLACK is applied to a black horse, that has got spots or marks more black or shining than the rest of his skin.

DAPS, a river of Denmark, which runs into the Little Belt, 14 miles N. E. of Hadersleben.

DARAH, or **DRAS**, a country of Africa, bounded on the N. by Morocco, Gezula, and Tafilet, on the E. and the S. by Zahara, and on the W. by Sus. It takes its name from the river Darah, or Dras, which passes through it. The principal produce is indigo and dates.

DARAMPOORY, a town of Hindostan, in the Mysore country, 88 miles E. of Seringapatam.

DARANTASIA, now **MOUSTEERS**, in ancient geography, a town of the Centrones, in Gallia Narbonensis, between Lemincum and Augusta Prætoria, called Forum Claudii by the Romans. Moustiers.

DARAPORUM, a town of Hindostan, 36 miles E. S. E. of Coimbatore.

DARAPTI, among logicians, one of the modes of syllogisms of the third figure, whose premises are universal affirmatives, and the conclusion is a particular affirmative: thus,

DAR- Every body is divisible;

AP- Every body is a substance;

TI- Therefore, some substance is divisible.

DARDA, a town and fort of Lower Hungary, 30 miles S. of Baes.

DARDANELLES, two ancient and strong castles of Turkey, one of which is in Romania, and the other in Natolia, on each side of the canal, formerly called the Hellespont.

DARDANI, 1. the ancient inhabitants of Troas: 2. the people of Dardania, who are supposed to have been descended from the former.

DARDANIA, in ancient geography, 1. a district of Moesia Superior on the S. now the S. part of Servia, towards the confines of Macedonia and Illyricum: 2. a small district of Troas, along the Hellespont: 3. the ancient name of Samothracia; from Dardanus, who removed thither.

DARDANIS, **DARDANIUM**, or **DARDANIUM PROMONTORIUM**, a promontory of Troas, near Abydos, running out into the Hellespont.

DARDANUS, a son of Jupiter and Electra, who after the death of his brother Jason, left Samothrace his country, and passed into Asia Minor, where he married Batia, the daughter of Teucer, king of Teucra. After the death of his father-in-law, he reigned sixty-two years.

DAREA, in botany, a genus of the cryptogamia filices class and order. Fructification in scattered nearly marginal lines: involucre originating laterally from a vein, opening towards the margin. There are nine species.

DAREL HAMARA, a town of Africa, in the kingdom of Fez. Lon. 6. 35. W. Lat. 34. 20. N.

DARIC, in antiquity, a famous piece of gold, first coined by Darius the Mede, about B. C. 538; probably during his stay at Babylon, out of the vast quantity of gold which had been accumulated in the treasury. From thence the darics were dispersed over the east, and into Greece; where they were also called stateres, and were the gold coins best known in Athens in ancient times. According to Dr. Bernard, the daric weighed two grains more than our guinea; but as it was very fine, and contained little alloy it may be reckoned worth about 25s. sterling.

DARIEN, or **TERRA FIRMA PROPER**, is the northern division of Terra Firma, or Castile del Oro. It is a narrow isthmus, that, properly speaking, joins North and South America together; but is generally reckoned as part of the latter. It is bounded on the N. by the gulf of Mexico; on the S. by the South Sea; on the E. by the river or gulph of Darien; and on the W. by another part of the South Sea, and the province of Veragua. It lies in the form of a bow or crescent, about the great bay of Panama, in the South Sea, and is 300 miles in length. Its breadth has generally been reckoned 60 miles from N. to S. but it is only 37 miles broad from Porto Bello to Panama, the two chief towns of the province.

DARIEN, GULF OF, an arm of the sea running eastward into the Isthmus, on the W. side of St. Sebastian.

DARIEN, a town of the United States, in Liberty county, Georgia, 47 miles S.S.W. of Savannah.

DARIL, in logic, one of the modes of syllogism of the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives: thus,

DA- Every thing that is moved, is moved by another;

RI- Some body is moved;

I- Therefore, somebody is moved by another.

DARKENED ROOM, the same as camera obscura; being a room darkened all but in one little hole, having a convex glass in it to transmit the rays of outward objects to a piece of paper, or white cloth in the room.

DARK TENT, a portable camera obscura, resembling a desk, and fitted with optic glasses, to take prospects of landscapes, &c.

DARKING, a town of Surrey, 10 miles E. of Guilford, and 24 S.S.W. of London.

DARKNESS, EGYPTIAN. One of the most terrible sorts of darkness was that which God by Moses brought upon Egypt, as a plague to the inhabitants of it. The Septuagint, our translation of the Bible, and indeed most others, in explaining Moses's account of this darkness, render it "a darkness which may be felt:" and the Vulgate has it, "a palpable darkness;" that is, a darkness consisting of black vapours and exhalations, so condensed that they might be perceived by the organs of seeing or feeling; but some commentators think that this is carrying the sense too far, since in such a medium as this mankind could not live an hour, much less for the space of three days, as the Egyptians are said to have done, during the time this darkness lasted; and therefore they imagine, that instead of a darkness that may be felt, the Hebrew phrase may signify a darkness wherein men went groping and feeling about for every thing they wanted. Le Clerc is of this opinion, and thinks that Philo, in his life of Moses, understood the passage in its right sense. "For in this darkness (says he), whoever were in bed, durst not get up; and such as their natural occasions compelled to get up, went feeling about by the walls, or any thing they could lay hold on, as if they had been blind." What it was that occasioned this darkness, whether it was in the air or in the eyes; whether it was a suspension of light from the sun in that country, or a black thick vapour which totally intercepted it, it would be in vain to conjecture.

DARKNESS, EXTRAORDINARY, AT OUR SAVIOUR'S CRUCIFIXION. During the last three hours that our Saviour hung upon the cross, a darkness covered the face of the earth, to the great terror and amazement of the people present at his execution. This extraordinary alteration in the face of nature (says Dr. Macknight, in his Harmony of the Gospels), was peculiarly proper, whilst the Sun of righteousness was withdrawing his beams from the land of Israel and from the world; not only because it was a miraculous testimony born by God himself to his innocence; but also because it was a fit emblem of his departure and its effects, at least till his light

light shone out anew with additional splendour in the ministry of his apostles. The darkness which now covered Judea and the neighbouring countries, beginning at noon and continuing till Jesus expired, was not the effect of an ordinary eclipse of the sun; for that can never happen but at the new moon, whereas now it was full moon; not to mention, that the total darkness occasioned by eclipses of the sun never continues above four minutes; wherefore it must have been produced by the divine power, in a manner we cannot explain. Accordingly, Luke (Luke xxiii. 44, 45), after relating that there was darkness over all the earth, adds, "and the sun was darkened;" which perhaps may imply, that the darkness of the sun did not occasion, but proceeded from, the darkness that was over all the land. Further, the Christian writers, in their most ancient apologies to the heathens, affirm, that as it was full moon at the passover when Christ was crucified, no such eclipse could happen by the course of nature. They observed also, that it was taken notice of as a prodigy by the heathens themselves.

DARLINGTON, a county of the United States, in Cheraws district, South Carolina, bounded on the S. and S.W. by Lynch's Creek. It is 35 miles long and 21 broad.

DARLINGTON, a town of Durham, situated on a flat on the river Skerne, 19 miles S. of Durham.

DARNEL, in botany. See **LOLIUM**.

DAROCA, a town of Spain, in the province of Arragon, 38 miles S.S.W. of Saragossa.

DARTFORD, a town of Kent, seated on the Darent, 16 miles E. by S. of London.

DARTMOUTH, a sea-port town in Devonshire, 30 miles S.S.W. of Exeter, and 204 W. by S. of London. Lon. 3. 45. W. Lat. 50. 22. N.

DARTMOUTH, a sea-port of the United States, in Bristol county, Massachusetts, 70 miles S. of Boston.

DARTOS, in anatomy, one of the coats which form the scrotum.

DARWAR, a considerable fortress of Hindostan, in the country of Sanore, 90 miles E. N. E. of Goa.

DASSEN, an island in the Atlantic, near the coast of Africa, between the Cape of Good Hope, and the Saldanha bay. Lon. 18° 1' 52" E. from Greenwich. Lat. 34° 25' N.

DASYPUS, the **ARMADILLO**, or **TATOU**, in zoology; a genus of the class mammalia, and order bruta. No tusks; grinders short and cylindrical, and seven or eight in each jaw; body covered with a shelly armour, intersected by circles. All the species of this animal were originally natives of America: they were entirely unknown to the ancients; and modern travellers mention them as peculiar to Mexico, Brazil, and the southern parts of America; though some indeed have confounded them with two species of manis, or shell-lizard, which are found in the East Indies: others report that they are natives of Africa, because some of them have been transported from Brazil to the coast of Guinea, where a few have since been propagated: but they were never heard of in Europe, Asia, or Africa, till after the discovery of America. They are all endowed with the faculty of extending and contracting their bodies, and of rolling themselves up like a ball, but not into so complete a sphere as the hedge-hog. They are very inoffensive animals, excepting when they get into gardens, where they devour the melons, potatoes, and other roots. They walk quickly; but can hardly be said to run or leap, so that they seldom escape the pursuit either of men or dogs. But nature has not left them altogether defenceless. They dig deep holes in the earth; and seldom go very far from their subterraneous habitations: upon any alarm they immediately go into their holes; but, when at too great a distance, they require but a few moments to make one. The hunters can hardly catch them by the tail before they sink their body in the ground; where they stick so close, that the tail frequently comes away and leaves the body in the earth; which obliges the hunters, when they want to take them alive and unimpaired, to dilate the sides of the hole. When they are taken, and find that there is no resource, they instantly roll themselves up, and will not extend their bodies, unless they are held near a fire. When in deep holes, there is no other method of making them come out, but by forcing in smoke or water. They keep in their holes through the day, and seldom go abroad in quest of subsistence, but in the night. The hunters usually chase them with small

dogs, which easily come up with them. When the dogs are near, the creatures instantly roll themselves up, and in this condition the hunters carry them off. However, if they be near a precipice, they often escape both the dogs and hunters: they roll themselves up, and tumble down like a ball, without breaking their shell, or receiving any injury. The dasypus is a very fruitful animal: the female generally brings forth four young ones every month; which is the reason why the species are so numerous, notwithstanding they are so much sought after, on account of the sweetness of their flesh. The Indians likewise make baskets, boxes, &c. of the shells which cover their heads. Linnaeus enumerates six species of dasypus, principally distinguished by the number of their moveable belts. Mr. Kerr, who prefers the arrangement of the Count de Buffon, to that of Linnaeus, enumerates ten species of this genus.

D. NOVEMCINCTUS, the **NINE-BANDED ARMADILLO**, has nine belts, four claws on each fore-foot, and five on the hind feet. The head is five inches long, the body 18, and the tail 12; but some are smaller. Plate XLII.

D. NOVEMDECIMCINCTUS, the **CIRQUINCON**, has no shield on the rump, and has only 18 bands, though from the name we should suppose it to have 19. The body is 10 inches long, the head three, and the tail five. The head resembles that of a weazel, having a large flat forehead, small eyes, and ears about an inch long. The breast, belly, and ears, are naked.

D. SEPTEMCINCTUS, the **SEVEN-BANDED ARMADILLO**, with seven belts; four toes on each of the fore-feet, and five on the hind. Gmelin says it has only six belts, but Mr. Kerr vindicates Linnaeus, who says it has seven.

D. SEXCINCTUS, the **ENCOURBERTO**, or **SIX-BANDED ARMADILLO**, has six moveable girdles, two shields, and five toes on each foot. It lives on roots and fruits; and the flesh is good. The head resembles a pig; there are 18 teeth in each jaw: the tail is thick at the rump; the body is of a reddish yellow colour, and is commonly plump. Plate XLII.

DATA, among mathematicians, a term for such things or quantities, as are given, or known, in order to find other things thereby that are unknown. Euclid uses the word data (of which he has a particular tract) for such spaces, lines, and angles, as are given in magnitude, or to which we can assign others equal. From the use of this word in mathematics, it has been transplanted into other arts; as philosophy, medicine, &c. where it expresses any quantity, which, for the sake of a present calculation, is taken for granted to be such, without requiring an immediate proof for its certainty; called also the given quantity, number, or power. And hence also such things as are known, from whence either in natural philosophy, the animal mechanism, or the operation of medicines, we come to the knowledge of others unknown, are now frequently in physical writers called data.

DATE, in law, is the description of the day, month, year of our Lord, and year of the reign of the king, in which a deed or other writing was made. Anciently deeds had no dates but only of the month and year, and now, if in the date of any deed, the year of our Lord is right, though the year of the king's reign be wrong, it shall not hurt the same. A deed is good, though it has no date of the day, or if that be mistaken, or though it contains an impossible date; but then he that pleads such a deed, must set forth the time when it was delivered: for every deed or writing has a date in law, and that is the day of the delivery; and where there is none, a plaintiff, it is said, may count it of any date. In writings of importance, the date should be written in words at length. In letters, it is usually written in figures. An autodate is a date prior to the real time when the instrument was signed. A post-date is that posterior to the real time when the instrument was passed.

DATISCA, **BASTARD-HEMP**, in botany, a genus of the dodecandria order, and diœcia class of plants; natural order, Miscellanea. Male calyx pentaphyllous; no corolla; anthera sessile, long, and 15 in number; female calyx bidented; no corolla, styles three; capsule triangular, three-horned, unilocular, perivious, polyspermous, inferior. It has two species, natives of North America.

DATISI, in logic, a mode of syllogisms in the third figure, wherein the major is an universal affirmative, and the minor and conclusion particular affirmative propositions. Thus,

DA- All who serve God are kings;

TI- Some who serve God are poor;

SI- Therefore, some who are poor are kings.

DATIVE, [*dativus*, Lat.] 1. [In grammar.] The epithet of the case that signifies the person to whom any thing is given. 2. [In law.] Those are termed dative executors who are appointed such by the judge's decree; as administrators with us here in England.

DATOLA, one of the Lipari islands, in the Mediterranean. It is 10 miles N. E. of Lipari.

DATUM, or **DATUS**, in ancient geography, a town of Thrace, situated between Neapolis, and the river Nessus. It was taken by Philip of Macedon, who changed its name to Philippi, being originally called Cronides on account of its springs.

DATURA, the **THORN-APPLE**, in botany, a genus of the monogynia order, and pentandria class of plants; natural order, Lurida. Corolla funnel-shaped, plaited; calyx tubular, angulated, deciduous; capsule quadrivalved. There are eight species; all, except one, annual herbs.

DATUS. See **DATUM**.

DAVA, or **USPO**, a province of Japan.

DAVAL, **PETER**, Esq. F. R. S. an eminent English mathematician. He was bred a barrister at law; was afterwards master in chancery; and at last accountant-general of that court. He translated the memoirs of Card. de Retz, printed in 12mo. 1723. In the dispute concerning elliptical arches, when Black-friars bridge was built, his opinion was applied for by the committee. His answer may be seen in the London Magazine for March 1760. He died January 8, 1763.

DAVALLIA, in botany, a genus of the cryptogamia, filices. Fructification in roundish distinct dots near the margin; involucre membranous from the surface, half-hooded, distinct, somewhat truncate, opening toward the margin. There are eighteen species.

DAUCUS, the **CARROT**, a genus of the digynia order, and pentandria class of plants; natural order, Umbellata. Corolla a little radiated, all hermaphrodite; fruit bristly, with short hairs. There are eight species; but the one which chiefly merits attention is the

D. CAROTA, or **COMMON CARROT**. There are several varieties, as the white, the orange, and the purple carrot; but of these the orange carrot is the most esteemed. It grows longer, larger, and is generally handsomer than the others, being often 15 or 18 inches long in the eatable part, and from two to four in diameter at top. Carrots are propagated by seeds, sown at different seasons of the year, to afford a supply for the table at all times. The season for sowing for the earliest crop is soon after Christmas. The situation should be open, but near a wall; though if they are sown close under it they will be apt to run up to seed too fast, and give no good roots: the most proper distance is eight inches. They delight in a warm sandy soil, which should be light, and well dug to a good depth, that the roots may meet with no obstruction in running down, so as to make them forked, and shoot out lateral branches. This will happen, especially when the ground has been too much dunged, the same year that the seeds were sown, which will also occasion them to be worm-eaten. The hairiness of these seeds makes the sowing of them difficult, on account of their being apt to stick together. They should, therefore, be put through a fine chaff sieve; and a calm day should be chosen for sowing them. When sown, they should be trod in with the feet, and the ground raked level over them. When they first come up, they should be cut up to four inches distance, and a month after this they are to be cleared again; and if drawn while young, they are now to be left at six inches distance every way; if they are to stand to grow large, they must be separated to 10 inches distance. The second season for sowing carrots is in February. This must be done under a wall or hedge, on warm banks; but those which are to be on open large quarters should not be sown till the beginning of March. In July, carrots may be sown for an autumnal crop; and lastly, in the end of August, for those which are to stand the winter. These last will be fit for use in March, before any of the spring ones; but they are seldom so tender or well tasted. In order to preserve carrots for use all winter, they are to be dug up in the beginning of November, and laid in a dry place in sand; and these roots being again planted in February, will ripen seeds in August for succeeding crops: the longest and straightest roots are to be chosen for this purpose. Carrots have been re-

commended as food for cattle. Dr. Hunter attempted to make ale from carrots; but though it worked kindly, and was in all respects treated as ale, yet, after keeping it four months, it proved of a thick muddy appearance. He attempted to fine it, but in vain. See *Georgical Essays*, 1773. "The taste (he adds) was by no means displeasing, as it much resembled malt liquor. My first intention being frustrated, I threw it into the still, being about 40 gallons in measure, and by two distillations obtained four gallons of a clean proof spirit. It had, however, contracted a flavour from the hop, which should be left out when the intention is to reduce the liquor into spirit. From a gross calculation, I am induced to think that a good acre of carrots manufactured in this manner, will leave a profit of 40l. after deducting the landlord's rent, cultivation, distillation, and other incidental expences. In this calculation, I presume that the spirit is worth 6s. per gallon, and not excised. An acre of barley will by no means produce so much spirit. A rich sandy loam is the best land for carrots; which after the crop is removed, will be in high cultivation for corn." Attempts have also been made to prepare sugar from carrots, but without success; a thick syrupy matter like treacle being the only product. A poultice made of carrots has been found to mitigate the pain, and abate the stench of foul and cancerous ulcers. Crickets are very fond of carrots; and are easily destroyed by making a paste of powdered arsenic, flour, and scraped carrots, which must be placed near their habitations. A marmalade made from carrots, by their strong antiseptic qualities, has also been found useful in preventing and curing the sea-scurvy. The seeds have been reckoned carminative and diuretic; and were formerly much used as a remedy for the stone. Carrots were first introduced into England by the Flemings, in the reign of queen Elizabeth.

DAVENTRY, or **DAINTRY**, a handsome town of Northamptonshire, 10 miles W. of Northampton.

DAUGHTER. See **CHILDREN**. Daughters, among the ancients, were more frequently exposed than sons, as requiring greater charge to educate and settle them in the world. See **EXPOSING OF CHILDREN**. Those who had no legitimate sons were obliged, by the Athenian laws, to leave their estates to their daughters, who were confined to marry their nearest relations, otherwise to forfeit their inheritance; as we find to have been practised likewise among the Jews, many of whose laws seem to have been transcribed by Solon. If an heiress happened to be married before her father's death, this did not hinder the nearest relation to claim the inheritance, and even to take the woman from her husband; which is said to have been a common case.

DAVID, [דָּוִד, Heb. *i. e.* beloved,] king of Israel, and Hebrew poet, was born at Bethlehem in B.C. 1085, and died B.C. 1014; after having reigned seven years and a half in Hebron, and thirty-three in Jerusalem. No hero, whose actions are recorded in sacred or profane history, exhibits a more striking contrast of character than David, or a more surprising mixture of the most eminent virtues and the most fervent piety, with the greatest crimes and vices. It would be foreign from the nature of this work, to expatiate upon either of these. Both are fully and impartially related in the Scriptures. But we cannot help observing, that while the former have led many well-meaning Christian authors almost to idolize the royal psalmist as a saint, the latter have given occasion to infidel writers to degrade him to a level with Nero and the worst of tyrants; and to ridicule revealed religion for stiling such a character "the man after God's own heart." Neither the one party nor the other seem to have adverted, that this expression relates only to David's government of the kingdom, in establishing purity of worship, and preserving the Israelites from those idolatries to which they were so prone. In this sense, and this alone, David was never equalled by any of his successors either in Israel or Judah. The context (Acts xiii. 21, 22), shews plainly, that it was in this sense only that David "fulfilled all his will." We find an expression nearly similar, used by the Almighty, upon a similar occasion, to a monarch much less eminent for piety, and whom nobody ever supposed to deserve the character of a man according to God's own heart, though in this instance he acted properly. "Thou hast done well," said the Lord to Jehu, (2 Kings x. 30,) upon his extirpating the idolatrous worship of Baal, "in executing that which is right in mine eyes, and hast done according to all that was in mine heart," &c. One of the most unjustifiable actions of David's life appears to have been his torturing of the Ammonites, with saws, harrows, and axes, and in brick

brick kilns. (2 Sam. xii. 31.) Even the *jus talionis* could hardly vindicate such wanton barbarity, had the Ammonites treated the Israelites in the same manner, which is no-where recorded. Some commentators, however, vindicate David from this charge of cruelty by saying, that the words he "put them under saws," &c. only mean that he subjected them to hard labour with these instruments; but though the passage in 2 Sam. might perhaps bear such a construction, we doubt the parallel passage in 1 Chron. xx. 3. will not admit of it, for it is expressly said that he "cut them with saws," &c. As an author and poet the merits of David have long been universally acknowledged, both by Jews and Christians. Those who deny, that there has ever been such a thing as any inspiration, or divine revelation, given by the Almighty to his creatures, in any age or country, would do well to study the Psalms of David, and compare them with the writings of the most celebrated authors in the Pagan world, and see if there is any thing equal to them in point of grand and sublime conceptions of the Deity, to be found in the best of the heathen authors. Upon such a comparison, the ideas given by Homer himself, of his deities, will be found quite puerile and contemptible. Let those, then, who deny revelation, account for this phenomenon, how a man born in an early age and a barbarous country, where the arts had made little progress, and the sciences much less, and bred up in one of the lowest stations of life, though afterwards raised to the highest, should have been capable, in the midst of much persecution, vicissitude of fortune, and cares of government, if not inspired, of composing a set of poems, which, in sublimity of sentiment, and just conceptions of the Deity, far excel the most admired productions of Greece and Rome, in their highest periods of refinement?

DAVIDICI, DAVIDISTS, or DAVID GEORGIANS, a sect of heretics, the adherents of David George, a native of Delft, who, in 1525, began to preach a new doctrine; publishing himself to be the true Messiah; and that he was sent thither to fill heaven, which was quite empty for want of people to deserve it. He is likewise said to have denied the existence of angels, good and evil, of heaven and hell, and to have rejected the doctrine of a future judgement. He rejected marriage with the Adamites; held, with Manes, that the soul was not defiled by sin; and laughed at the self-denial so much recommended by Jesus Christ. Such were his principal errors. He made his escape from Delft, and retired first into Friesland, and then to Basil, where he changed his name, assuming the name of John Bruck, and died in 1556. He left some disciples behind him, to whom he promised that he would rise again at the end of three years. Nor was he altogether a false prophet: for the magistrates of that city being informed, at three years end, of what he had taught, ordered him to be dug up and burnt, together with his writings, by the common hangman.

DAVID'S, Str., a town of Asia, in the peninsula on this side the Ganges, and on the coast of Coromandel, which had formerly a fort. The town lies 80 miles S. of Fort St. George. Lon. 79. 45. E. Lat. 11. 30. N.

DAVID'S, Str., an episcopal town of South Wales, in Pembroke-shire, 24 miles N. W. of Pembroke.

DAVID'S TOWN, a town of New Jersey.

DAVIESIA, in botany, a genus of the class and order decandria monogynia. Calyx angular, simple, five-cleft; corolla papilionaceous; stigma simple, acute; legume compressed, one-seeded. One species, *D. australasia*, described by Dr. Smith in the fourth volume of the Linnæan Transactions.

DAVIS, JOHN, a famous navigator in the 16th century, was born at Sandridge, near Dartmouth in Devonshire; and distinguished himself by making three voyages to the most northern parts of America, in order to find out a N. W. passage to the East Indies; in which he discovered the Straits which bear his name. He afterwards performed five voyages to the East Indies; in the last of which he was slain in a desperate fight with some Japanese, near the coast of Malacca, on the 27th of December, 1605. He wrote an account of his second voyage for the discovery of the N. W. passage; a voyage to the East Indies; and other tracts.

DAVIS, Sir JOHN, an eminent lawyer and poet, born about 1570. He first distinguished himself by his poem "Nosce Teipsum" on the Immortality of the Soul. He became attorney-general, and speaker of the house of commons in Ireland; and afterwards was appointed lord chief justice of the court of King's

Bench in England, but died before his installation, in 1626. He published many law tracts; but was esteemed more as a scholar and a wit, than as a lawyer.

DAVIS'S QUADRANT, the common sea quadrant or backstaff. See **QUADRANT**.

DAVIS'S STRAIT, a narrow sea, lying between the N. main of America, and the western coast of Greenland; running N. W. from Cape Farewell.

DAVIT, in a ship, a long beam of timber, represented by *a, a*, (Plate LIV. fig. 2.) It is used as a crane whereby to hoist the flukes of the anchor to the top of the bow, without injuring the sides of the ship as it ascends; an operation which, by mariners, is called fishing the anchor. The anchors being situated on both the bows, the davit may be occasionally shifted, so as to project over either side of the ship, according to the position of that anchor on which it is employed. The inner end of the davit is secured by being thrust into a square ring of iron *b*, which is bolted to the deck, and forelocked under the beams. This ring, which is called the span-shackle, exhibited at large in fig. 3, is fixed exactly in the middle of the deck, and close behind the foremast. Upon the outer end of the davit is hung a large block *c*, through which a strong rope traverses, called the fish-pendent *d*; to the foremost end of which is fitted a large iron hook *e*, and to the after end a tackle or complication of pulleys *f*; the former of which is called the fish-hook and the latter the fish-tackle. The davit, therefore, according to the sea-phrases, is employed to fish the anchor; which being previously catted, the fish-hook is fastened upon its flukes; and the effort of the tackle being transmitted to the hook, by means of the fish-pendent, draws up that part of the anchor sufficiently high upon the bow to fasten it, which is done by the shank-painter. See that article. There is also a davit of a smaller kind occasionally fixed in the long-boat, and employed to weigh the anchor therein.

DAUMA, a kingdom of Africa, in Negroland, with a town of the same name. Lon. 34. 10. E. Lat. 8. 0. N.

DAVOS, a town of the Helvetic republic, and capital of a jurisdiction of the same name, in the country of the Grisons. It is 60 miles S. E. of Zurich.

DAUPHIN, a title given during the monarchy of France, to the presumptive heir of the crown; on account of the province of Dauphiné, which in 1349 was given to Philip VI. on this condition, by Hubert II. dauphin of Viennois.

DAUPHIN was anciently the title of the princes of Viennois in France. Most authors who have sought the origin of the name Dauphin and Dauphiné, seem to have given too much loose to conjecture. Du Chesne is of opinion, that it was the grandson of Guy the Fat who first bore the name of dauphin. Chorier observes, that William, canon of Notre Dame at Grenoble, who has written the life of Margaret, daughter of Stephen earl of Burgundy, married with Guy, the son of Guy the Fat, calls the latter simply Guy the Old, and the former always count Dauphin; and adds, that no record, no monument, ever attributes the title of dauphin to Guy the Fat or any of his predecessors: so that it must necessarily have taken its rise in his son, all whose successors so constantly assumed it, that it became the proper name of the family. He died in 1142, in the flower of his youth: so that it must have been about 1120 that the title commenced; and without doubt, adds he, on some illustrious occasion.

DAUPHIN, an island about 10 miles long, in the mouth of Mobile bay, in the Gulf of Mexico.

DAUPHIN, Fort, a jurisdiction, fort, and sea-port town in the N. part of the island of St. Domingo.

DAUPHINY, or DAUPHINE', a late province of France, which was bounded on the W. by the Rhone, on the N. by the Rhone and Savoy, on the S. by Provence, and on the E. by the Alps.

DAX, DACQS, or ACQS, a town of France, in the department of Landes. See **ACQS**.

DAXABON, DAJABON, DAHABON, or LAXABON, a settlement of the Spaniards on the line between the French and Spanish divisions of the island of St. Domingo. It was settled to prevent smuggling, when the Spaniards had their share of the island.

DAXABON, a town in the above district, 240 miles N. W. of St. Domingo.

DAY, according to the most natural and obvious sense of the word,

word, signifies that space of time during which it continues to be light; in contradistinction to night, being that partition of time wherein it is dark; but the space of time in which it is light, being somewhat vague and indeterminate, the time between the rising and setting of the sun is usually looked on as the day; and the time which lapses from its setting to its rising again, the night. The word **day** is often taken in a larger sense, so as to include the night also; or to denote the time of a whole apparent revolution of the sun round the earth, in which sense it is called by some a natural day, and by others an artificial one: but to avoid confusion, it is usual to call it in the former sense simply the day, and in the latter a *nychthemeron*, by which term that acceptance of it is aptly denoted, as it implies both day and night. The *nychthemeron* is divided into 24 parts called hours; which are of two sorts, equal and unequal, or temporary. See **HOUR**. Different nations begin their day at different hours. See **CHRONOLOGY**. The method of beginning the day at midnight prevails in Great Britain, France, Spain, and most parts of Europe, except Italy, and several parts of Germany; where they begin their day at sun-setting, and reckon on till it sets next day, calling that the 24th hour: these are generally termed Italian hours. The Jews also began their *nychthemeron* at sun-setting: but then they divided it into twice twelve hours, as we do; reckoning twelve for the day, be it long or short, and twelve for the night; so that their hours continually varying with the day and night, the hours of the day were longer than those of the night for one half-year, and the contrary the other; from whence their hours are called temporary: those at the time of the equinoxes became equal, because then those of the day and night are so. The Romans also reckoned their hours after this manner, as do the Turks at this day. This kind of hours is called planetary, because the seven planets were anciently looked upon as presiding over the affairs of the world, and to take it by turns each of these hours, according to the following order: Saturn first, then Jupiter, Mars, the Sun, Venus, Mercury, and last of all the Moon: hence they denominated each day of the week from that planet whose turn it was to preside the first hour of the *nychthemeron*. Thus, assigning the first hour of Saturday to Saturn, the second fell to Jupiter, the third to Mars, and so the 22d of the same *nychthemeron* fell to Saturn again, the 23d to Jupiter, and the 24th to Mars: so that on the first hour of the next day, it fell to the Sun to preside; and by the like reckoning, the first hour of the next fell to the Moon; of the next to Mars; of the next to Mercury; of the next to Jupiter; of the next to Venus: hence the days of the week came to be distinguished by the Latin names, of *Dies Saturni*, *Solis*, *Lunæ*, *Martis*, *Mercurii*, *Jovis*, and *Veneris*; and among us, by the names of Saturday, Sunday, Monday, &c.

DAY, CIVIL, NATURAL, SIDEREAL, AND SOLAR. See **CHRONOLOGY** and **ASTRONOMY**. The sidereal day is shorter than the mean solar day by 3' 56" nearly. We are inclined to think that many persons, especially in the higher walks of life, avail themselves of the change of seasons; inasmuch, that by the law of fashion, in winter they convert the night into day; and in summer exchange the most agreeable mornings and forenoons, for damp, unwholesome evenings and nights. It would be a vain attempt to reprobate this unnatural custom, in those circles where it is fancied to be equally vulgar to repair to bed in good time, and to rise early; a practice instinctively followed even by the lower animals. To the industrious and more domestic members of society, we venture to recommend, while in a good state of health, the following division of the day: namely, in spring and autumn to rise with the first rays of the sun; in summer, one hour after; and in winter, one hour before the luminary appears;—to allot every day (Sundays excepted,) from ten to twelve hours to useful occupations; from six to seven hours to the various purposes of dressing, taking provisions, exercise, or amusements; and also from six to seven, or eight hours, to repose, accordingly as they have been more or less fatigued the preceding day, either by mental or bodily exertions.

DAYS OF GRACE, in commerce, are a customary number of days allowed for the payment of a bill of exchange, &c. after the same becomes due. Three days of grace are allowed in Britain; ten in France and Dantzic; eight at Naples; six at Venice, Amsterdam, Rotterdam, and Antwerp; four at Frankfort; five in Leipzig; twelve at Hamburgh; six in Portugal; fourteen in

Spain; thirty in Genoa, &c. In Britain the days of grace are given and taken as a matter of course, the bill being only paid on the last day: but in other countries, where the time is much longer, it would be reckoned dishonourable for a merchant to take advantage of it; bills are therefore paid on the very day they fall due.

DAYS OF GRACE, in law, are those granted by the court at the prayer of the defendant or plaintiff.

DAY, in a legal sense, relates to the day of appearance of parties, or the continuance of suits, where a day is given, &c. See the article **ESSOIN**. In real actions there are common days and special days given by the judges, in an assise, &c.

DAYS IN BANK, are days set down by statute or order of the court, when writs shall be returned, or when the party shall appear on the writ served. They say also, if a person be dismissed without day, he is finally discharged.

DAY-LIGHT, in our law, some time after sun-setting, and before sun-rising, being accounted part of the day, when the hundred is liable for any robberies committed within that time.

DAY'S MAN, in the north of England, an arbitrator or person chosen to determine an affair in dispute.

DAYS OF GRACE, in trade and commerce, an indulgence granted to the acceptor of a bill, by which it is ordered that the holder shall take no measures, and not even protest an acceptance until the expiration of certain days after the bill becomes due. In London three days of grace are allowed; in Amsterdam, six; in Hamburgh, twelve; in Dantzic, ten; in Copenhagen, eight; in Berlin, three; and a different term in almost every distinct mercantile city.

DAY'S POINT, a district of Virginia, on the banks of James river.

DAY'S WORK, among seamen, the reckoning or account of the ship's course during twenty-four hours, as between noon and noon, according to the rules of trigonometry. See **DEAD RECKONING**.

DEACON, [*Διακον*®, Gr. a servant,] in ecclesiastical polity, one whose business is to baptise, read in the church, and assist at the celebration of the eucharist. Seven deacons were instituted by the apostles, Acts chap. vi. which number was retained a long time in several churches. Their office was to serve in the *Agapæ*, and to distribute the bread and wine to the communicants. Another part of their office was to be a sort of directors to the people in the exercise of their public devotions in the church; for which purpose they used certain forms of words, to give notice when each part of the service began. Whence they are sometimes called *eirokrukes*; or holy criers of the church. Deacons had, by licence from the bishop, a power to preach, to reconcile penitents, and to represent their bishops in general councils. Their office out of the church was to take care of orphans, widows, prisoners, and all the poor and sick who had any title to be maintained out of the revenues of the church; to inquire into the morals of the people, and to make their report to the bishop. Whence, on account of the variety of business, it was usual to have several deacons in the same church. In the Latin church, it is the deacon's office to incense the officiating priest or prelate; to lay the corporal on the altar; to receive the pattern or cup from the subdeacon, and present them to the person officiating; to incense the choir; to receive the pax from the officiating prelate, and carry it to the subdeacon; and at the pontifical mass, when the bishop gives the blessing, to put the mitre on his head, and to take off the archbishop's pall and lay it on the altar. In England, the form of ordaining deacons, declares that it is their office to assist the priest in the distribution of the holy communion: in which, agreeably to the practice of the ancient church, they are confined to the administering wine to the communicants. A deacon in England is not capable of any ecclesiastical promotion; yet he may be a chaplain to a family, curate to a beneficed clergyman, or lecturer to a parish church. He may be ordained at 23 years of age, but it is expressly provided, that the bishop shall not ordain the same person a priest and deacon in the same day. The qualifications of a deacon in the primitive church are mentioned by the apostle Paul, 1 Tim. iii. 8—13.

DEACONESS, an order of women who had their distinct offices and services in the primitive church. This office appears as ancient as the apostolical age; for St. Paul calls *Phæbe*, *Διακον*®, a servant of the church of Cenchrea. Tertullian calls them, *viduæ*, widows,

widows, because they were commonly chosen out of the widows of the church; and Epiphanius, and the council of Laodicea, call them *πρεσβυτιδες*, elderly women, because none but such were ordinarily taken into this office. For, indeed, by some ancient laws, these four qualifications were required in every one that was to be admitted into this order. 1. That she should be a widow. 2. That she should be a widow that had borne children. 3. A widow that was but once married. 4. One of a considerable age, 40, 50, or 60 years old. Though all these rules admitted of exceptions.

DEAD LANGUAGES. See **PHILOLOGY**.

DEAD LIGHTS, certain wooden ports which are made to fasten into the cabin windows, to prevent the waves from gushing into the ship in a high sea. As they are made exactly to fit the windows, and are strong enough to resist the waves, they are always fixed in on the approach of a storm, and the glass lights taken out, which must otherwise be shattered to pieces by the surges, and suffer great quantities of water to enter the vessel.

DEADLY FEUD, in English law-books, a profession of irreconcilable enmity, till a person is revenged by the death of his enemy. The word *feud* is derived from the German *Fehd*; which, as Hottoman observes, signifies *modo bellum, modo capitales inimicitias*. See **FEUD**. Such enmity and revenge was allowed by law in time of the Saxons. If any man was killed, and a pecuniary satisfaction was not made to the kindred, it was lawful for them to take up arms and revenge themselves on the murderer: this was called deadly feud; and probably was the original of an appeal.

DEADLY NIGHTSHADE. See **ATROPA**.

DEADMAN'S ISLAND, one of the Magdalen islands. Lon. 61. 30. W. Lat. 47. 22. N.

DEAD MENS EYES, in the sea language, a kind of blocks with many holes in them, but no sheevers, whereby the shrouds are fastened to the chains; the crow-feet reeve also through these holes: and, in some ships, the main stays are set tight in them; but then they have only one hole, through which the lanyards are passed several times.

DEAD NETTLE. See **LAMIUM**.

DEAD RECKONING, in sea language, that estimation of conjecture which the seamen make of the place where a ship is, by keeping an account of her way by the log, by knowing the course they have steered by the compass, and by rectifying all with the allowance for drift or leeway; so that this reckoning is without any observation of the sun, moon, and stars, and is to be rectified as often as any good observation can be had. This account kept for 24 hours is called a day's work.

DEAD SEA, in geography, a lake of Judea, into which the river Jordan discharges itself; being about 70 miles long and 20 broad.

DEAD TOPS, a disease incident to young trees, and cured by cutting off the dead parts close to the next good twig or shoot, and claying them over as in grafting.

DEAD WATER, at sea, the eddy water just astern of a ship; so called, because it does not pass away so swift as the water running by her sides does. They say that a ship makes much dead-water when she has a great eddy following her stern.

DEAFNESS, the disease of the ear, which prevents its due reception of sounds. See **MEDICINE**. Deafness generally arises either from an obstruction or a compression of the auditory nerve; or from some collection of matter in the cavities of the inner ear; or from the auditory passage being stopped up by some hardened excrement; or lastly, from some excrescence, a swelling of the glands, or some foreign body introduced within it. Those born deaf are also dumb, as not being able to learn any language, at least in the common way. However, as the eyes in some measure serve them for ears, they may understand what is said by the motion of the lips, tongue, &c. of the speaker; and even accustom themselves to move their own; as they see other people do, and thus learn to speak. Thus Dr. Wallis taught two young gentlemen born deaf to know what was said to them, and return pertinent answers. Digby gives us another instance of the same within his own knowledge; and there was a Swiss physician lately living at Amsterdam, one John Conrad Amman, who effected the same in several children born deaf with surprising success. He reduced the art to a systematic method, which he published in his "Surdus Loquens," Amstelod. 1692, and "De Loquela," ibid.

1700. But no person has excelled Mr. Braidwood, in the art of teaching the deaf and dumb to speak. The instances of his success with various pupils, born perfectly deaf, but whom he has nevertheless taught to speak, read, write, cast accounts, and even to become masters of the most abstruse branches of science, are numerous and astonishing. In the Phil. Trans. No. 312, we have an account by Mr. Waller, R. S. Secretary, of a man and his sister, each about 50 years old, born in the same town with Mr. Waller, who had neither of them the least sense of hearing; yet both of them knew, by the motion of the lips only, whatever was said to them, and would answer pertinently to the question proposed. It seems they could both hear and speak when children, but lost their sense afterwards; whence they retained their speech, which, though uncouth, was yet intelligible. Such another instance is that of Mr. Goddy's daughter, minister of St. Gervais in Geneva, related by Bishop Burnet: "At two years old they perceived she had lost her hearing; and ever since, though she hears great noises, yet she hears nothing of what is said to her. But by observing the motions of the mouth and lips of others, she acquired so many words, that out of these she has formed a sort of jargon, in which she can hold conversation whole days with those that can speak her language. She knows nothing that is said to her, unless she sees the motions of their mouths that speak to her, so that in the night they are obliged to light candles to speak to her. One thing will appear the strangest part of the whole narration: she has a sister, with whom she has practised her language more than any body else; and in the night, by laying her hand on her sister's mouth, she can perceive by that what she saith, and so can discourse with her in the dark." (Burn. Let. IV. p. 248. See **DUMBNESS**.) It is observable, that deaf persons, and several other persons dull of hearing, hear better and more easily if a loud noise be raised at the time when one speaks to them: which is owing, no doubt, to the greater tension of the ear-drum on that occasion. Dr. Wallis mentions a deaf woman, who if a drum were beat in the room could hear any thing very clearly; so that her husband hired a drummer for a servant, that by this means he might hold conversation with his wife. The same author mentions another, who, living near a steeple, could always hear very well, if there was a ringing of three or four bells, but never otherwise.

DEAL, in carpentry, a thin kind of fir plank. They are formed by sawing the trunk of a tree into a great many longitudinal divisions, of more or less thickness according to the purposes they are intended to serve. A very good method of seasoning planks for deal, is to throw them into salt water as soon as they are sawed; and keep them there three or four days, frequently turning them. In this case they will be rendered much harder, by drying afterwards in the air and sun: but neither this, nor any other method yet known, will preserve them from shrinking. Rods of deal expand laterally, or cross the grain, in moist weather, and contract again in dry; and thence have been found to make an useful hygrometer. Deals are imported into this country from Christiana, and other parts of Norway; from Dantzic, and various parts of Prussia; from St. Petersburg, Archangel, Narva, Memel, &c. They are sold by the piece, or by the standard hundred, or by the long hundred of 120. A standard, or reduced deal, is one inch and a half thick, eleven inches wide, and twelve feet long.

DEAL, in geography, a town of England, in Kent, between Dover and Sandwich; supposed to be the Dola of Ninnius, and situated on a flat and level coast, 7 miles S. by E. of Sandwich, and 72 E. by S. of London. Lon. 1. 29. E. Lat. 51. 13. N.

DEALBATION, [*dealbatio*, Lat.] the act of bleaching or whitening; rendering things white which were not so before: a word in little use.

DEAMENA, in the mythology, the goddess who was supposed to preside over women during their menses.

DEAN, [*decanus*, Latin; *doyen*, Fr.] from the Greek word *δεκα*; in English, ten; because he was anciently set over ten canons or prebendaries at least in some cathedral church.

DEAN is an ecclesiastical dignitary in cathedral and collegiate churches, and head of the chapter. As there are two foundations of cathedral churches in England, the old and the new, so there are two ways of creating deans. Those of the old foundation, founded before the suppression of monasteries, as the deans of St. Paul's, York, &c. are raised to that dignity much after the manner of bishops, the king first sending his congé d'elire, the chapter electing

electing, and the king granting his royal assent, the bishop confirms him, and gives his mandate to install him. Those of the new foundation, whose deanries were raised upon the ruins of priories and convents, such as the deans of Canterbury, Durham, Ely, Norwich, Winchester, &c. are donative, and installed by virtue of the king's letters patent, without either election or confirmation. Canonists distinguish between deans of cathedral and those of collegiate churches. The first, with their chapter, are regularly subject to the jurisdiction of the bishop. As to the latter, they have usually the contentious jurisdiction in themselves, though sometimes this belongs to them in common with the chapter. There are cathedral churches which never had a dean, and in which the bishop is head of the chapter, and in his absence, the archdeacon: such are the cathedrals of St. David and Landaff. There are also deans without a chapter, as the dean of Battle in Sussex, dean of the arches, &c. and deans without a jurisdiction, as the dean of the chapel royal. In this sense the word is applied to the chief of certain peculiar churches or chapels.

DEAN AND CHAPTER are the council of the bishop, to assist him with their advice in affairs of religion, as well as in the temporal concerns of his see. When the rest of the clergy were settled in the several parishes of each diocese, these were reserved for the celebration of divine service in the bishop's own cathedral; and the chief of them who presided over the rest, obtained the name of decanus or dean, being probably at first appointed to superintend ten canons or prebendaries.

DEAN OF A MONASTERY was a superior established under the abbot, to ease him in taking care of ten monks; whence he was called decanus.

DEAN, RURAL, called also Arch-presbyter, originally exercised jurisdiction over ten churches in the country, and afterwards became only the bishop's substitute, to grant letters of administration, probates of wills, &c.; to convocate the clergy; and to signify to them sometimes by letters the bishop's will, and to give induction to the archdeacon. Their office is now lost in that of the archdeacons and chancellors.

DEAN, in geography, a forest of England in Gloucestershire, between the Severn and the county of Monmouth.

DEAN, GREAT DEAN, or MICHAEL DEAN, a town in the above forest, 12 miles W. of Gloucester.

DEAN, is also a title given to certain civil officers; as

1. **DEAN OF FACULTY**, the president of the Faculty of Advocates, in Scotland.

2. **DEAN OF GUILD**, the chief judge of the Guild Court. See **LAW**.

DEATH is generally considered as the separation of the soul from the body; in which sense it stands opposed to life, which consists in the union thereof. Physicians usually define death by a total stoppage of the circulation of the blood, and a cessation of the animal and vital functions consequent thereon; as respiration, sensation, &c. An animal body, by the actions inseparable from life, undergoes a continual change. Its smallest fibres become rigid; its minute vessels grow into solid fibres no longer pervious to the fluids; its greater vessels grow hard and narrow; and every thing becomes contracted, closed, and bound up; whence the dryness, immobility, and extenuation, observed in old age. By such means the offices of the minuter vessels are destroyed; the humours stagnate, harden, and at length coalesce with the solids. Thus are the subtilist fluids in the body intercepted and lost, the concoction weakened, and the reparation prevented; only the coarser juices continue to run slowly through the greater vessels, to the preservation of life, after the animal functions are destroyed. At length, in the process of these changes, death itself becomes inevitable, as the necessary consequence of life. But it is rare that life is thus long protracted, or that death succeeds merely from the decays and impairment of old age. Diseases, a long and horrid train, cut the work short. The signs of death are in many cases very uncertain. If we consult what Winslow or Bruchier have said on this subject, we shall be convinced, that between life and death the shade is so very undistinguishable, that all the powers of art can scarcely determine, where the one ends and the other begins. The colour of the visage, the warmth of the body, and suppleness of the joints, are but uncertain signs of life still subsisting; while, on the contrary, the paleness of the complexion, the coldness of the body, the stiffness of the extremities, the cessation of all

motion, and the total insensibility of the parts, are but uncertain marks of death begun. In the same manner also, with regard to the pulse and breathing; these motions are often so kept under, that it is impossible to perceive them. By bringing a looking-glass near to the mouth of the person supposed to be dead, people often expect to find whether he breathes or not. But this is a very uncertain experiment: the glass is frequently sullied by the vapour of the dead man's body; and often the person is still alive, though the glass is no way tarnished. In the same manner, neither burning nor scarifying, neither noises in the ears nor pungent spirits applied to the nostrils, give certain signs of the discontinuance of life; and there are many instances of persons who have endured them all, and afterwards recovered without any external assistance, to the astonishment of the spectators. This ought to be a caution against hasty burials, especially in cases of sudden death, drowning, &c. No person who has died, or appeared to die suddenly, should be interred till undoubted signs of putrefaction appear.

DEATH, SYMPTOMS OF: 1. Cessation of the pulse; 2. Total suppression of breathing; 3. Loss of animal heat; 4. Rigidity of the body, and inflexibility of the limbs; 5. Relaxation of the lower jaw; 6. Inability of the eye-balls to return to their sockets, when pressed by the finger; 7. Dimness, faintness, and sinking of the cornea, or uppermost horny coat of the eye; 8. Foam in the cavity of the mouth; 9. Blue spots of various sizes, and on different parts of the body; 10. A cadaverous smell; 11. Insensibility to all external stimulants. All these symptoms, however, if individually considered, are far from being conclusive: they then only afford a certain criterion of death, when most or all those appearances concur at the same time, especially if the sixth, seventh, and tenth of the signs be strongly marked.

DEATH APPARENT, is that state in which life is suspended, either because the body is not susceptible of external stimuli, or the interior organs are in a state similar to that of palsy. Dr. Struve, in his "Practical Essay on the Art of recovering Suspended Animation," lately translated from the German 12mo. London, 1801, exhibits the following view of all the Symptoms of Life: A slight degree of warmth in the region of the heart, accompanied with contractions and dilatations; a vibrating motion of the whole body, especially after being sprinkled with cold water; and a convulsive tension of some muscles. Doubtful Signs: Rigidity of the limbs, gradual smoothness of the skin, warmth and redness in particular parts of the body, hiccough, contraction and hissing of the nostrils, a tremulous motion of the whole body, mucus issuing from the nose during the artificial inflation of the lungs, a slight convulsive motion of the mouth, and a firm compression of the teeth. More certain signs: Gentle throbbing of the heart; pulsation of the temporal arteries; a slight convulsive motion of the inner corner of the eye; vibration of the eye-ball; and almost imperceptible convulsions of the muscles surrounding the neck. Distinct signs of Life: A gentle motion of the jaw; gradual redness of the lips and cheeks; contraction of the different muscles in the face; convulsive motions of the toes; sneezing; tremor of the whole body; vomiting; respiration interrupted by coughing; and groaning.

DEATH, in law: The law makes a distinction between natural and civil death.

DEATH, CIVIL, takes place, where a person is not actually dead, but adjudged so by law. Thus, if any person, for whose life an estate is granted, remains beyond sea, or is otherwise absent, seven years, and no proof of his being alive, he shall be accounted naturally dead.

DEATH, NATURAL, in law, means a person actually dead.

DEATH-WATCH, in natural history, is also called pediculus, fatidicus, mortisaga, pulsatorius, &c. There are two kinds of death-watches. 1. Of the first we have a good account in the Phil. Trans. by Mr. Allen. It is a small beetle, $\frac{1}{8}$ of an inch long, of a dark brown colour, spotted; having pellucid wings under the vagina, a large cap or helmet on the head, and two antennæ proceeding from beneath the eyes, and doing the office of proboscides. The part it beats withal, he observed, was the extreme edge of the face, which he chooses to call the upper lip, the mouth being contracted by this bony part, and lying underneath out of view. This account is confirmed by Dr. Derham; with this difference, that instead of ticking with the upper lip, he observed the insect to draw back its mouth, and beat with its forehead. That

author had two death-watches, a male and a female, which he kept alive in a box several months; and could bring one of them to beat whenever he pleased, by imitating its beating. By this ticking noise he could frequently invite the male to get up upon the other in the way of coition. When the male found he got up in vain, he would get off again, beat very eagerly, and then up again: Whence the Dr. concludes those pulsations to be the way whereby these insects woo one another, and find out and invite each other to copulation. II. The second kind of death-watch is an insect in appearance quite different from the first. The former only beats seven or eight strokes at a time, and quicker; the latter will beat some hours together without intermission; and his strokes are more leisurely, and like the beat of a watch. It is a small greyish insect, much like a louse when viewed with the naked eye. It is very common in all parts of the house in summer: it is very nimble in running to shelter, and shy of beating when disturbed; but will beat very freely, and even answer one's beating, if viewed without giving it disturbance, or shaking the place where it lies, &c. Dr. Derham cannot say whether they beat in any other thing, but he never heard their noise except in or near paper. He is in doubt whether it be made by their heads, or rather snouts, against the paper; or whether it be not made after some such manner as grasshoppers and crickets make their noise. He inclines to the former opinion. The reason of his doubt is, that he observed the animal's body to shake and give a jerk at every beat, but could scarce perceive any part of its body to touch the paper. But its body is so small and near the paper, and its motion in ticking so quick, that he thinks it might be, yet he did not perceive it. The ticking, as in the other, he judges to be a wooing act.

DEBENHAM, a town in Suffolk, 84 miles N. N. E. of London.

DEBENTURE, [*debentur*, Latin, from *debeo*,] a writ or note, by which a debt is claimed.

DEBENTURE is used at the customhouse for a kind of certificate signed by the officers of the customs, which intitles a merchant exporting goods to the receipt of a bounty or draw-back. All merchandises that are designed to be taken on board for that voyage being entered and shipped, and the ship being regularly cleared out, and sailed out of port on her intended voyage, debentures may be made out from the exporter's entries, in order to obtain the draw-backs, allowances, bounties, or premiums; which debentures for foreign goods are to be paid within one month after demand. And in making out these debentures, it must be observed, that every piece of vellum, parchment, or paper, containing any debenture for drawing back customs or duties, must, before writing, be stamped, and pay a duty of eight-pence. The forms of debentures vary according to the merchandise exported. In the execution of debentures for tobacco, it must be particularly observed, 1. That debentures for the same quantity may be made on one or more parchments. 2. That the exporter's oath must be printed, specifying whether he acts for himself or on commission. 3. If exported to any other foreign ports than Ireland, the word Ireland must be added to the oath after Great Britain. 4. That as no tobacco may be consumed on board of ships of war in Europe but what has paid full duties, and been manufactured in Great Britain, no drawback is to be allowed for tobacco exported in any man of war. 5. That the eight pounds per hogshead of 350 pounds, or more, allowed for draught at importation, must not be deducted on exportation. 6. That debentures for tobacco exported to Ireland must not be paid till a certificate be produced, testifying the landing thereof. 7. That no persons may swear to the exportation but such as are permitted to swear to debentures for other goods. In debentures for all other foreign goods, no person may be admitted to swear to the exportation but the true exporter, either as a proprietor, or who, being employed by commission, is concerned in the direction of the voyage. All kinds of debentures, before being delivered or paid to the exporters, are entered into a separate book kept for that purpose by the collector and comptroller of the customs.

DEBILITY, is that feeble state of life in which the vital functions are languidly performed; when the mind loses its cheerfulness and vivacity; when the limbs are tottering with weakness, and the digestive faculty is impaired. This complaint, which at present is so prevalent, even in the bloom of life, and among those who ought to form the most vigorous and robust part of a nation,

may arise from a great variety of causes, of which the following are the principal: 1. Descent from enfeebled parents; 2. Changes in the admixture, and component parts of the surrounding atmosphere. 3. A sedentary and indolent mode of life. 4. Immoderate sleep; or, in a still more hurtful degree, want of the necessary portion of sleep and repose. 5. Too great exertions either of mind or body. 6. The unnecessary and imprudent use of medicines; lastly, the almost total disuse, and exclusion of gymnastic exercise, and the general introduction of sedentary games, the effect of which creates an almost universal apathy to every pursuit that requires exertion. Debility is the source of numerous disorders, such as spasms, palsy, violent evacuations, hemorrhages, putrid and nervous fevers, fainting fits, and apparent death.

DEBIR, in ancient geography, a sacerdotal city of Palestine, in Hebron.

DE-BOIS-BLANC, an island of the United States, belonging to the North-Western Territory, which was a voluntary gift of the Chipeway Indians, at the treaty of peace, concluded by General Wayne, at Greenville, in 1795.

DEBRECEN, DEBRECHIN, DEBRECZIN, or DEBRETZEN, a large and populous town of Hungary, 67 miles W. N. W. of Colosvar, and 165 E. S. E. of Vienna.

DEBRUIZED, in heraldry, a term peculiar to the English, by which is intimated the grievous restraint of any animal, debarred of its natural freedom, by any of the ordinaries being laid over it.

DEBT, debitum, in law, any thing due to another, whether it be money, goods, or services; or the action brought for recovering the same. Where money is due upon any speciality, an action of debt, and no other, lies. On a bond, debt may be brought against the obligor or his heir, who has lands by descent, if the executors have not sufficient to pay it; and an heir mediate may be sued for debt, as if he were an immediate heir. If a person acknowledges, by deed, that he has so much of another's money in his hands, here the action of debt will lie for it; and where one owes a sum of money to another, who hath his note under hand, without a seal, action of debt on a mutuum lies. Debt lies also on a recognizance; so upon a statute merchant, which is in nature of a bond, or obligation: but it is said to be otherwise, in case of a statute staple. Whether an action of debt be brought on a bill, bond, lease, &c. the several writings are to be well considered, by which the plaintiff warrants his action, and the sum due must be rightly set forth: thus, if it be for rent, the time of commencement and ending must be specified; and the judgement, where the demand is in the debt and detinet, is to recover the debt, damages, and costs of suit. But in a debt on a single bill, a defendant may plead payment, before the action brought in bar; and, on bond, he may bring in the principal, interest, and costs pending the action, and thereupon be discharged.

DEBT TO THE KING, comprehends in it all rents, issues, amerciaments, and other things due to the king, whose debts are preferred before those of a subject; and until his debt is satisfied, he may protect the debtor from the arrests of others. Pledges shall not be distrained for these debts, where the principal is sufficient.

DEBT, NATIONAL. See NATIONAL DEBT.

DEBTOR, a person who owes any thing to another, in contradistinction to creditor, which is he to whom the debt is owing. See BOOK-KEEPING. Where debt is a simple contract, it follows the person of the debtor, and, it is said, not of the creditor, as to actions brought, &c. There have been divers statutes discharging debtors out of prison, when they had no effects to pay their creditors.

DECACHORDON, in antiquity, a musical instrument with ten strings, called by the Hebrews hasur, being almost the same as our harp, of a triangular figure, with an hollow belly, and sounding from the lower part.

DECADE, [*deka*, Gr. *decem*, Lat.] the sum of ten; a number containing ten.

DECADE, in literary history, has been appropriated to the number of books, into which the Roman History of Titus Livius is divided.

DECADE, in the new French calendar. See CALENDAR.

DECADI, in the French calendar, the name of the 10th day of each decade, or the 10th, 20th, and 30th day of each month.

DECAGON, in geometry, a plane figure with ten sides and ten angles; it is called a regular decagon, when all the sides and angles are equal. If we suppose the radius of a circle to be

r , then will $\sqrt{\frac{5}{2}r^2 - \frac{1}{2}r}$, or $\sqrt{\frac{5-1}{2}} + r$, be the side of a decagon

inscribed in that circle. Again, supposing the side of a decagon to be 1, the area thereof will be 8.69; whence as 1 to 8.69, so is the square of the side of any given decagon to the area of that decagon.

DECAYGNIA, [from $\delta\epsilon\kappa\alpha$, ten, and $\gamma\upsilon\gamma\eta$, a woman,] an order in the class decandria, consisting of plants whose flowers are furnished with ten stamina and ten styles. See BOTANY.

DECALOGUE, [$\delta\epsilon\kappa\alpha\lambda\omicron\gamma\omicron$,] the ten commandments given by God to Moses. They were engraved by God on two tables of stone. The Jews, by way of eminence, called these commandments the ten words, from whence they had afterwards the name of decalogue: but they joined the 1st and 2d into one, and divided the last into two. They understand that against stealing to relate to the stealing of men, or kidnapping; alleging, that the stealing one another's goods or property is forbidden in the last commandment. The church of Rome has struck the 2d commandment quite out of the decalogue; and to make their number complete, has split the tenth into two. The reason is obvious.

DECANDRIA, [$\delta\epsilon\kappa\alpha$, ten, and $\sigma\iota\ \alpha\upsilon\delta\eta\epsilon\varsigma$, men,] in the Linnean system of botany, a class of plants, the great characteristic of which is, that they have hermaphrodite flowers, with ten stamina in each. See BOTANY.

DECANTATION, among chemists, &c. the gently pouring off a liquor from its fæces, by inclining the lip or canthus of the vessel; whence the name. The design of this operation, is in order to have the liquor free from the sediment, which, upon standing, it lets fall to the bottom of the vessel.

DECANUS, in Roman antiquity, an officer who presided over the ten officers, and was head of the contubernium, or serjeant of a file of soldiers.

DECAPOLIS, [$\delta\epsilon\kappa\alpha$ and $\eta\ \pi\acute{o\lambda\iota\varsigma$,] in ancient geography, a district beyond Jordan, almost wholly belonging to the half-tribe of Manasseh; before the captivity, called Bethsan.

DECAPROTI, DECEPRIMI, in Roman antiquity, officers for gathering the taxes.

DECARCH, [from $\delta\epsilon\kappa\alpha$, ten, and $\alpha\rho\chi\eta\varsigma$, or $\alpha\rho\chi\omega\nu$, chief,] a captain of ten.

DECCAN, an Indian term signifying South, under which the East Indian geographers include all the countries of India S. of the parallels of 21° or 22° of N. Lat. forming an extent of territory nearly equal to the British islands, Spain, and European Turkey; but in its proper and more limited sense, it means only the countries situated between Hindostan Proper, the Carnatic, the Western Indian sea, and the province of Orissa; i. e. the provinces of Candeish, Dowlatabad, or Amednagar, Visiapour, Golconda, and the western part of Berar. Hydrabad is the capital.

DECCAN SHABAZPOUR, an island lying in the mouth of the Ganges. Lon. 98.58 . E. Lat. 22.30 . N.

DECEIT, *dolus*, in law, a subtle trick, or device, to which may be added all manner of craft and collusion, or underhand practice, used to defraud another, by any means whatever. Deceit is an offence both by common law and by statute. All practices of defrauding, or endeavouring to defraud, another of his right, are punishable by fine and imprisonment, and sometimes pillory, &c. and there is a writ called deception, that lies for one who receives injury or damage, &c. A writ of deceit lies against attorneys, for losses sustained by their default; also against bakers, brewers, and other artificers, for not selling good commodities, or refusing to perform a bargain: in all which cases, they are, by statute, liable to penalties in proportion to their offence.

DECEIVED, in the manege; a horse is said to be deceived, upon a demivault of one or two treads, when working, for instance, to the right, and not having yet finished above half the demivault, he is pressed one time or motion forwards, with the inner leg, and then is put to a reprite upon the left, in the same cadence with which he began; and thus he regains the place where the demivault had been begun to the right, and works to the left: thus a horse may be deceived upon any hand.

DECEMBER, the month wherein the sun enters the tropic of Capricorn, and makes the winter-solstice. Among the ancient Romans December was under the protection of Vesta. Romulus assigned it 30 days, Numa reduced it to 29, which Julius Cæsar increased to 31. In the reign of Commodus, this month was called, by way of flattery, Amazonius, in honour of a courtesan whom that prince passionately loved, and had got painted like an Amazon; but this name died with that tyrant. At the end of December they had the juveniles ludi; and the country people kept the feast of the goddess Vacuna in the fields, having then gathered in their fruits and sown their corn; whence seems to be derived our popular festival called Harvest-Home.

DECEMPEDA, [$\delta\epsilon\kappa\alpha\mu\pi\epsilon\delta\alpha$, from *decem*, ten, and *pes*, a foot,] ten feet rod, an instrument used by the ancients in measuring. It was a rule or rod divided into ten feet; the foot was subdivided into 12 inches, and each inch into 10 digits. The decempeda was used both in measuring land, like the chain among us; and by architects to give the proper dimensions and proportions to the parts of their buildings, which use it still retains.

DECEMVIRATE, [*decemviratus*, Lat.] the dignity and office of the ten governors of Rome, who were appointed to rule the commonwealth instead of consuls. Their authority subsisted only two years. Any body of ten men.

DECEMVIRI, ten magistrates of absolute authority among the Romans. I. The privileges of the patricians raised dissatisfaction among the plebeians; who, though freed from the power of the Tarquins, still saw that the administration of justice depended upon the will and caprice of their superiors, without any written statute to direct them, and convince them that they were governed with equity and impartiality. The tribunes complained to the senate, and demanded that a code of laws might be framed for the use and benefit of the Roman people. This petition was complied with; and three ambassadors were sent to Athens and the other Grecian states, to collect the laws of Solon and all the other celebrated legislators of Greece. Upon the return of the commissioners it was universally agreed, that ten new magistrates called Decemviri, should be elected from the senate to put the project into execution. Their power was absolute, all other officers ceased after their election, and they presided over the city with regal authority. They were invested with the badges of the consul, in the enjoyment of which they succeeded by turns; and only one was preceded by the fasces, and had the power of assembling the senate and confirming decrees. The first decemvirs were Appius Claudius, T. Genutius, P. Sextus, Sp. Veturius, C. Julius, A. Manlius, Ser. Sulpitius, Pluricius, T. Romulus, and Sp. Posthumus; A. U. C. 302. Under them the laws which had been exposed to public view, that every citizen might speak his sentiments, were publicly approved of as constitutional, and ratified by the priests and augurs in the most solemn and religious manner. They were ten in number, and were engraved on tables of brass; two were afterwards added, whence they were called the laws of the XII tables, *leges XII tabularum*, and *leges decemvires*. The decemviral power, which was at first beheld by all ranks of people with the greatest satisfaction, was continued; but in the 3d year after their creation the decemvirs became odious on account of their tyranny; and the attempt of Ap. Claudius to ravish Virginia totally abolished the office. The people were so exasperated against them, that they demanded them from the senate to burn them alive. Consuls were again appointed, and tranquillity re-established in the state. II. There were other officers in Rome called decemvirs, who were originally appointed in the absence of the prætor to administer justice. Their appointment became afterwards necessary, and they generally assisted at sales called subhastiones, because a spear, *hasta*, was fixed at the door of the place where the goods were exposed to sale. They were called *decemviri litibus judicandis*. III. The officers whom Tarquin appointed to guard the Sibylline books were also called decemviri. They were originally two in number, called *duumviri*, till A. U. C. 388, when their number was increased to ten, five of whom were chosen from the plebeians and five from the patricians. Sylla increased their number to 15, hence called *quindecimvirs*.

DECEM TALES, in law, a writ that issues directed to the sheriff, whereby he is commanded to make a supply of jurymen, where a full jury does not appear on a trial at bar.

DECENNALIA, ancient Roman festivals, celebrated by the emperors

emperors every 10th year of their reigns, with sacrifices, games, and largesses for the people. Augustus first instituted these solemnities, in which he was imitated by his successors.

DECHALES, **CLAUDIUS FRANCIS MILLIET**, an excellent mathematician, mechanic, and astronomer, descended from a noble family, and born at Chambery in 1611. His principal performances are an edition of Euclid's Elements, in which the unserviceable propositions are rejected, and the uses of those retained, annexed; a discourse on fortification; and another on navigation. These with others have been collected first in 3 vols. folio, and afterwards in 4, under the title of *Mundus Mathematicus*: being indeed a complete course of mathematics. He died in 1678, professor of mathematics in the university of Turin.

DECIATES, or **DECIATH**, an ancient people of Gallia Narbonensis, near the borders of Italy, on the Mediterranean.

DECIATUM OPIRUM, in ancient geography, a town of the Deciates, situated between Antibes and Nice.

DECIDUOUS, an appellation chiefly used in respect to plants; thus, the calyx or cup of a flower is said to be deciduous, when it falls along with the flower leaves; and, on the contrary, it is called permanent, when it remains after they are fallen. Again, deciduous leaves are those which fall in autumn; in contradistinction to those of the evergreens, which remain all the winter.

DECIES TANTUM, a writ which lies against a juror who has taken money for giving his verdict; called so of the effect, because it is to recover ten times as much as he took. Stat. 98 Edw. III. c. 12 and 13. Decies tantum lies against sheriffs taking a reward for arraying a pannel. 11 H. VI. c. 14. See *Vin. Abr.* 378 and 382.

DECIL, in astronomy, an aspect or position of two planets, when they are distant from each other a tenth part of the zodiac.

DECIMÆ, **TITHES**. - See **TITHES**.

DECIMAL ARITHMETIC, the art of computing by decimal fractions.

DECIMAL FRACTION, that whose denominator is always 1, with one or more cyphers: thus, an unit may be imagined to be equally divided into 10 parts, and each of these into 10 more; so that by a continual decimal subdivision the unit may be supposed to be divided into 10, 100, 1000, &c. equal parts, called tenth, hundredth, thousand parts of an unit. See **ARITHMETIC**.

DECIMATION, a punishment inflicted by the ancient Romans, on such soldiers as quitted their posts, or behaved themselves cowardly in the field. The names of the guilty were put into an urn or helmet, and as many were drawn out as made the tenth part of the whole number, and those were put to the sword, and the others saved.

DECIPHERING, the art of reading or explaining ciphers. See **CIPHER**. The rules of deciphering are different, according to the language in which the ciphers are wrote: but in fact it is difficult, if not impossible, to form any general rules, which will apply in all cases to the discovery of the meaning of ciphers; which are arbitrary in their nature, and the rules of which must vary in almost every different instance of importance, as the sole object of those who use them is to prevent a possibility of detection. And where even the language in which the ciphers are wrote is uncertain, the difficulty of deciphering must be greatly increased, and the art rendered entirely conjectural.

DECIZE, a town of France, in the department of Nievre, 16 miles S. E. of Nevers.

DECK OF A SHIP, is a planked floor from stem to stern, upon which the guns lie, and where the men walk to and fro. Great ships have three decks, first, second, and third, beginning to count from the lowermost. Half-deck reaches from the main-mast to the stem of the ship. Quarter-deck is that aloft the steerage, reaching to the round house. Flush-deck is that which lies even in a right line fore and aft, from stem to stern. A rope-deck is made of cordages, interwoven and stretched over a vessel, through which it is easy to annoy an enemy who comes to board her. They are little used but by small vessels, to defend them from privateers. See **SHIPBUILDING**.

DECK, FLUSH, implies a continued floor laid from stem to stern, upon one line, without any stops or intervals.

DECK, HALF, a space under the quarter-deck of a ship of war, contained between the foremost bulk head of the steerage and the

fore-part of the quarter-deck. In the colliers of Northumberland the steerage itself is called the half-deck, and is usually the habitation of the crew.

DECLAMATION, a speech made in public, in the tone and manner of an oration, uniting the expression of action to the propriety of pronunciation, in order to give the sentiment its full impression upon the mind. The word is also used in a derogatory sense, as when it is said, "such a speech was mere declamation," it implies, that it was deficient in point of reasoning, or had more sound than sense. According to the manners and customs of the present age, public harangues are made only, 1. In the pulpit. 2. In the senate, in council, or other public assembly. 3. By public professors. 4. On the theatre. We shall notice the three first:

1. **DECLAMATION IN THE PULPIT**. The dignity and sanctity of the place, and the importance of the subject, require the preacher to exert the utmost powers of his voice to produce a pronunciation that is perfectly distinct and harmonious, and that he observe a deportment and action which is expressive and graceful. No man, therefore, who is destitute of a good voice, should ascend the pulpit. The preacher should not, however, roar like a common crier, and rend the ear with a voice like thunder; for such kind of declamation is not only without meaning and without persuasion, but highly incongruous with the meek and gentle spirit of the gospel. He should likewise take particular care to avoid a monotony; his voice should rise from the beginning, as it were by degrees, and its greatest strength should be exerted in the application. Each inflexion of the voice should be adapted to the phrase, and to the meaning of the words; and each remarkable expression should have its peculiar inflexion. The dogmatic requires a plain, uniform tone of voice only; and the menaces of the gospel demand a greater force than its promises and rewards: but the latter should not be pronounced in the soft tone of a flute, nor the former with the loud sound of a trumpet. The voice should still retain its natural tone in all its various inflexions. Happy is that preacher, to whom nature has given a voice that is at once strong, flexible, and harmonious. An air of complacency and benevolence, as well as devotion, should be constantly visible in the countenance of the preacher. But every appearance of affectation must be carefully avoided: for nothing is so disgusting to an audience, as even the semblance of dissimulation. Eyes constantly rolling, turning towards heaven, and streaming with tears, rather denote a hypocrite, than a man possessed of the real spirit of religion, and who feels the true import of what he preaches. An air of affected devotion infallibly destroys the efficacy of all that the preacher can say, however just and important it may be. On the other hand, he must avoid every appearance of mirth or railery, or of that cold unfeeling manner, which is so apt to freeze the heart of his hearers. The body should be in general erect, and in a natural and easy attitude. The perpetual movement or contortion of the body, has a ridiculous effect in the pulpit, and makes the figure of a preacher and a harlequin too similar. On the other hand, he ought not to remain constantly upright and motionless, like a speaking statue. The motions of the hands give a strong expression to a discourse; but they should be decent, grave, noble, and expressive. The preacher, who is incessantly in action, who is perpetually clapping his hands, or who menaces with a clenched fist, or who counts his arguments on his fingers, will only excite mirth among his auditory. In a word, declamation is an art that the sacred orator should study with assiduity. The design of a sermon is to convince, to affect, and to persuade. The voice, the countenance, and the action, which are to produce this triple effect, are therefore objects to which the preacher should particularly apply himself.

2. **DECLAMATION IN THE SENATE, &c.** The declamation of a minister or statesman, in the senate, in council, or other public assembly, is of a more unconfined nature. To persuade, to move the passions, and gain an ascendancy in a public assembly, the orator should himself feel the force of what he says, and the declamation should only express that internal sensation. But nothing should be carried to excess. A suavity in the tone of voice, a dignity of deportment, a graceful action, and a certain tranquillity of countenance, should constantly accompany the statesman when he speaks in public, even when he is most earnestly engaged in debate, or when he is addressing his sovereign in person. A pleasing tone of voice, and a distinct pronunciation, prejudice

the hearers greatly in the speaker's favour. A young man may improve these to a surprising degree. Demosthenes, who had a natural impediment in his speech, was accustomed to go to the sea-shore, and partly filling his mouth with pebbles he declaimed with a loud voice. The stones by degrees gave a volubility to his tongue, and the roaring of the waves reconciled him insensibly to the noise of the multitude.

3. DECLARATION OF PUBLIC PROFESSORS. The principal object of a public professor is the instruction of the studious youth: for which purpose, he is to convince and persuade. Every tone of voice, every expression of the countenance, or action of the body, which can produce this effect by enforcing the words, should therefore be employed by those who are to teach the sciences. There is one essential reflection which every professor ought to make; viz. that he is surrounded by young students, naturally possessed with vivacity, often ludicrous, and for the most part previously instructed in the preparatory sciences. They are therefore constantly inclined to criticise, to jest, and to ridicule: for which reason, the professor should endeavour to inspire them with respect and attention, by a grave, commanding, and venerable countenance; and carefully avoid any appearance of grimace in his action, and every kind of affectation in his discourse, that he may not afford the least opportunity for pleasantry.

DECLARATION, is a shewing in writing the grief and complaint of the demandant, or plaintiff, against the defendant, or tenant, wherein he is supposed to have done some wrong. And this ought to be plain and certain, both because it impeaches the defendant, and also compels him to answer thereto. It is also an exposition of the writ, with the addition of time, circumstances, &c. and must be true as well as clear, for the court will not take things in it by implication; and it sets forth the names both of the plaintiff and defendant, the nature and cause of the action, &c. and the damage received. Such a declaration in an action real is termed a count, and it is essential, that the count or declaration ought to contain demonstration, declaration, and conclusion; and in the conclusion the plaintiff ought to aver, and offer to prove his suit, and shew the damages he has sustained by the wrong done him. Declaration must be certain: containing, 1. Such sufficient certainty whereby the court may give a peremptory and final judgement upon the matter in controversy. 2. The defendant may make a direct answer to the matter contained therein. 3. That the jury, after issue joined, may give a complete verdict thereupon. 4. No blank, or space, to be left therein.

DECLARATION OF WAR, a public proclamation made by the herald at arms to the members or subjects of a state, declaring them to be at war with some foreign power, and forbidding all and every one to aid or assist the common enemy at their peril.

DECLENSION, in grammar, an inflexion of nouns according to their divers cases, as nominative, genitive, dative, &c. With regard to languages, where the nouns do not admit of changes in the same number, declension is the expression of the different states a noun is in, and the different relations it has. See **GRAMMAR**.

DECLENSION OF A DISEASE is when it is past its height.

DECLINATION, in astronomy, the distance of any celestial object from the equinoctial, either northward or southward. It is either true or apparent, according as the real or apparent place of the object is considered. The declination being an arch of a secondary of the equinoctial intercepted between a given point and the equinoctial, and perpendicular to the same, the declination of a star, &c. is found in the following manner. First observe the altitude of the pole, as PR, Plate L.L. fig. 6, this subtracted from 90°, gives the height of the equator AH; then the meridian-altitude of the star HD being observed, if it be greater than the altitude of the equator AH, the latter subtracted from the former, leaves the declination northward AD: or if the altitude of the star HT be less than that of the equator AH, the former subtracted from the latter, leaves the declination southward TA. If the star be in the quadrant ZR, then the least altitude MR, subtracted from the altitude of the pole PR, leaves the distance from the pole PM; which subtracted again from the quadrant PQ, leaves the declination MQ. See **ASTRONOMY**.

DECLINATION OF THE SEA-COMPASS, OR NEEDLE, is its variation from the true meridian of any place. See **VARIATION**.

DECLINATION OF A WALL OR PLANE FOR DIALS is an arch of the horizon, contained either between the plane and the prime vertical circle, if you reckon it from the east or west; or else between the meridian and the plane, if you account it from north or south. There are many ways given by authors for finding the declination of a plane, of which all those that depend upon the magnetic needle deserve to be suspected on many accounts. The common method, by finding the sun's horizontal distance from the pole of the plane, is subject to many errors and difficulties. The way therefore we would recommend as the best for finding the declination of a plane, is by a declinator. See the next article.

DECLINATOR, or DECLINATORY, an instrument contrived for taking the declinations, inclinations, and reclinations, of planes. It is constructed in the following manner: on a square wooden board, ABCD, Plate L.L. fig. 7, describe a semicircle AED, and divide the two quadrants AE and ED into 90°, each beginning from E, as in the figure: then having fixed a pin in the centre F, fit a ruler HI, upon the same, moveable thereon, with a box and needle K, fig. 8. In order to take the declination of a plane, apply the side AD to the plane proposed, as MN, fig. 9, and move the ruler FG, with the compass G, about the centre F, till the needle rest upon the line of the magnetical meridian of the place: if the ruler cut the quadrant in E, the plane is either directly northern or southern; but if it cut between D and E, the plane declines to the west; and if between A and E, to the east, by the quantity of the angle GFE. Would you take the inclinations and reclinations of planes with this instrument, instead of the ruler and needle, a thread with a plummet is fitted on a pin in the centre F; then the side BC of the declinator ABCD, fig. 10, being applied to the proposed plane, as IL, if the plum-line FG cut the semicircle AED, in the point E, the plane is horizontal; or if it cut the quadrant ED, in any point at G, then will EFG be the angle of inclination: lastly, if applying the side AB to the plane, the plummet cut E, the plane is vertical. Hence if the quantity of the angle of inclination be compared with the elevation of the pole and equator, it is easily known whether the plane be inclined or reclined. See **INCLINATION** and **RECLINATION**.

DECLINING DIALS, those which do not face directly any of the four cardinal points. See **DIALING**.

DECLIVIS, in anatomy, a muscle otherwise called obliquus descendens.

DECOCTION, [*decoctum*, Lat.] the act of boiling any thing, to extract its virtues.

DECOCTION is only applicable to matters containing some principles soluble in water; such particularly are animal and vegetable matters. Decoction ought not to be used with such substances as contain any volatile principles, as they would be dissipated in the air during the process. But it may be safely used, nay, even becomes necessary, when the matters to be treated are solid, and of a close and compact texture; because then the water could not extract its principles without a boiling heat. Most soft animal matters, as flesh, skin, tendons, may be conveniently boiled in water; because they contain no principle volatile with a boiling heat. Water extracts from them nothing but a gelatinous substance, and some oily parts which float on the surface of the water. All vegetable matters which are inodorous, and particularly those which are hard, as roots, barks, &c. are generally boiled, when an extraction of their principles by water is required. To this rule, however, there are some exceptions. Peruvian bark, for instance, gives its strength to cold water better than to such as is boiling hot. Many other vegetables have also the property of yielding less to boiling than cold water. And therefore a general rule may be established, that decoction ought not to be employed but when absolutely necessary, that is, when the same principles, or the same quantities of those principles cannot be obtained by an infusion, and that without heat, if it can be so done, considering that the proximate principles of vegetables are generally so delicate, and so susceptible of change and decomposition, that frequently the most gentle heat changes much their nature and properties.

DECOLLATION is used for a painting, wherein is represented John the Baptist's head struck off from his trunk. It is likewise the name of a festival held in honour of that martyr.

DECOMPOSITION, in chemistry, usually signifies the division or separation of the constituent parts of bodies. It differs from mere mechanical division, in that when a body is chemically decomposed, the parts into which it is resolved are essentially different from the body itself; but though a mechanical force is applied to it ever so long, or if with ever so much violence, the minutest particles into which the body may be reduced, still retain their original nature. Thus, let nitre be reduced to ever so fine a powder, each particle retains the nature of nitre, as much as the compounded mass; but sulphuric acid is applied, a decomposition takes place, and one of the largest component parts of the nitre rises in the form of a smoking acid spirit, which never could have been suspected to lie hid in the mild neutral salt.

DECORATION, in architecture, any thing that adorns and enriches a building, church, triumphal arch, or the like, either without side or within. The orders of architecture contribute greatly to the decoration; but the several parts of those orders must have their just proportions, characters, and ornaments; otherwise the finest order will bring confusion rather than richness. See **ARCHITECTURE**. Decorations in churches, are paintings, vases, festoons, &c. occasionally applied to the walls; and with so much conduct and discretion, as not to take off any thing from the form of the architecture: as is much practised in Italy at the solemn feasts.

DECORUM, in architecture, is the suitableness of a building, and the several parts and ornaments thereof, to the station and occasion.

DECOUPLE, in heraldry, the same as uncoupled; thus a chevron decouple, is a chevron wanting so much of it towards the point, that the two ends stand at a distance from one another, being parted and uncoupled.

DECOY, among fowlers, a place made for catching wild fowl. A decoy is generally made where there is a large pond surrounded with wood, and beyond that a marshy and uncultivated country: if the piece of water is not thus surrounded, it will be attended with the noise and other accidents which may be expected to frighten the wild fowl from a quiet haunt, where they mean to sleep, during the day, in security. If these noises or disturbances are wilful, an action will lie against the disturber. As soon as the evening sets in, the decoy rises (as they term it), and the wild fowl feeds, during the night. If the evening is still, the noise of their wings during their flight, is heard at a very great distance, and is a pleasing, though melancholy sound. This rising of the decoy in the evening, is in Somersetshire called radding. The decoy ducks are fed with hempseed, which is thrown over the screens in small quantities, to bring them forwards into the pipes or canals, and to allure the wild fowl to follow, as this seed floats. There are several pipes, as they are called, which lead up a narrow ditch that closes at last with a funnel net. Over these pipes (which grow narrower from their first entrance) is a continued arch of netting suspended on hoops. It is necessary to have a pipe, or ditch, for almost every wind that can blow, as upon this circumstance it depends which pipe the fowl will take to; and the decoy man always keeps on the leeward side of the ducks, to prevent his effluvia reaching their sagacious nostrils. All along each pipe, at certain intervals are placed screens made of reeds, so situated, that it is impossible the wild fowl should see the decoy man, before they have passed on towards the end of the pipe, where the purse net is placed. The inducement of the wild fowl to go up one of these pipes is, because the decoy ducks trained to this lead the way, either after hearing the whistle of the decoy man, or enticed by the hempseed: the latter will dive under water, whilst the wild fowl fly on, and are taken in the purse net. It often happens, however, that the wild fowl are in such a state of sleepiness and dozing, that they will not follow the decoy duck. Use is then generally made of a dog, who is taught his lesson; he passes backwards and forwards between the reed screens (in which are little holes, both for the decoy man to see, and the little dog to pass through); this attracts the eye of the wild fowl, who, not choosing to be interrupted, advance towards the small and contemptible animal, that they may drive him away. The dog all the time, by the direction of the decoy man, plays among the screens of reeds, nearer and nearer the purse-net; till at last, perhaps, the decoy man appears behind a screen, and the wild fowl not daring to pass by him in return, nor being able to escape upwards on account of the net covering, rush on into the purse-net. Sometimes the dog

will not attract their attention, if a red handkerchief, or something very singular, is not put about him. The general season for catching fowls in decoy, is from the end of October till February; the taking of them earlier is prohibited by an act 10 Geo. II. c. 32, which forbids it from June 1 to October 1, under the penalty of 5s. for each bird destroyed within that space. The Lincolnshire decoys are commonly set at a certain annual rent, from 5l. to 20l. a year; and there is one in Somersetshire that pays 30l. The former contribute principally to supply the markets in London. Amazing numbers of ducks, wigons, and teal, are taken a few winters past, in one season, and in only ten decoys, in the neighbourhood of Wainfleet, the number amounted to 31,200, in which were included several other species of ducks. These quantities make them so cheap on the spot, that the decoy men would be content to contract for years to deliver their ducks at Boston, for 10d. per couple. It was customary formerly to have in the fens an annual driving of the young ducks before they took wing. Numbers of people assembled, who beat a vast tract, and forced the birds into a net placed at the spot where the sport was to terminate; 150 dozens have been taken at once; but this practice being supposed to be detrimental, has been abolished by act of parliament.

DECOY, in naval affairs, a stratagem employed by a ship of war, to betray a vessel of inferior force into an uncautious pursuit, till she has drawn her within the range of her cannon, or what is called within gunshot. It is usually performed by painting the stern and sides in such a manner as to disguise the ship, and represent her either much smaller and of inferior force, or as a friend to the hostile vessel, which she endeavours to ensnare, by assuming the emblems and ornaments of the nation to which the stranger is supposed to belong. When she has thus provoked the adversary to chase, in hopes of acquiring a prize, she continues the decoy, by spreading a great sail, as endeavouring to escape; at the same time that her course is considerably retarded by an artful alteration of her trim till the enemy approaches. Decoying is also performed to elude the chase of a ship of a superior force in a dark night, by throwing out a lighted cask of pitch into the sea, which will burn for a considerable time, and misguide the enemy. Immediately after the cask is thrown out, the ship changes her course, and may easily escape, if at any tolerable distance from the foe.

DECREE, in the civil law, is a determination which the emperor pronounces upon hearing a particular cause between the plaintiff and defendant.

DECREE IN CHANCERY, the determination of the lord chancellor, upon a full hearing of the merits of a cause.

DECREE OF COUNCILS, laws made by them, to regulate the doctrine and policy of the church.

DECREET, in the law of Scotland, a final decree or judgment of the lords of session, from which an appeal only lies to parliament.

DECREMENT, in heraldry, signifies the wane of the moon from the full to the new. The moon in this state is called moon decrecent, or in decours; and when borne in coat armour, faces to the left side, when in the increment.

DECREPITATION, in chemistry, signifies the quick separation of the parts of a body, occasioned by a strong heat, and accompanied with noise and crackling. This effect is most frequently produced by water contained betwixt the parts of the decrepitating body, when these parts have a certain degree of adhesion together. This water being quickly reduced into vapour by the heat suddenly applied to it, rarefies, and bursts with noise the parts which compress it. The bodies most subject to decrepitation are certain salts, such as common salt, vitriolated tartar, nitre of lead, &c. the decrepitation of all which proceeds from the water of their crystallization. Clays which are not perfectly dry, and flints, are also subject to decrepitation.

DECRESCENT, [from *decrescens*, Lat.] growing less; being in a state of decrease.

DECRETAL, [*decretal*, Lat.] the collection of the pope's decrees. The decretals compose the second part of the canon law. The first genuine one, acknowledged by all the learned as such, is a letter of Pope Siricius, written A. D. 385, to Himerus, bishop of Tarragona, in Spain, concerning some disorders which had crept into the churches of Spain. Gratian published a collection of decretals, containing all the ordinances made by the popes till A. D. 1150. Gregory IX. in 1227, following the example of Theodo-

sus and Justinian, formed a constitution of his own, collecting into one body all the decisions and all the causes which served to advance the papal power; which collection of decretals was called the pentateuch, because it contains five books.

DECTURAPOUR, one of the Laccadive islands, in the Indian sea. Lon. 72. 0. E. Lat. 12. 8. N.

DECUMARIA, in botany, a genus of the monogynia order, and didecandria class of plants. Calyx eight to twelve-leaved, superior; petals eight to twelve; capsule eight-celled, with many seeds. There is but one species, viz. *D. barbara*, climbing decumaria, a native of Carolina.

DECUPLE PROPORTION, that of ten to one.

DECURIA, a **DECURY**, among the ancient Romans, ten men under one leader, called the Decurio. The decurio was the third part of a turma, or the 30th of a legion of horse, which consisted of 300 men. The Roman cavalry was divided into decuria, which were subdivisions of a century, each century containing ten decuries.

DECURIO, a subaltern officer in the Roman armies, who commanded a decuria.

DECURIONES, **MUNICIPALES**, magistrates in the Roman provinces, who formed a body to represent the Roman senate in free and corporate towns.

DECUSSATION, in geometry, optics, and anatomy, signifies the crossing of two lines, rays, or nerves, when they meet in a point, and then go on separately from one another.

DECUSSORIUM, an instrument used by surgeons, which, by pressing gently on the dura mater, causes an evacuation of the pus collected between it and the cranium, through the perforation made by the trepan.

DEDDINGTON, a town of Oxfordshire, 16 miles N. of Oxford.

DEDHAM, a town in Essex, seated on the Stour, 7 miles N. N. E. of Colchester.

DEDICATION, [*dedicatio*, Lat.] the act of consecrating a temple, altar, statue, palace, &c. to the honour of some deity. The use of dedications is very ancient both among the worshippers of the true God and among the heathens: the Hebrews call it *hhanuchah*, "imitation;" which the Greek translators render *ἱεραία*, and *ἱεραγωγία*, "renewing." In the scripture we meet with dedications of the tabernacle, of altars, of the first and second temple, and even of the houses of private persons. One of the most solemn on record is that of the first temple by Solomon. (1 Kings viii. 2 Chron. vi.) There were also dedications of vessels, and garments of the priests and Levites, and even of the men themselves. The heathens had also dedications of temples, altars, and images, of their gods, &c. Nebuchadnezzar held a solemn dedication of his statue, Dan. iii. 2. Pilate dedicated gilt bucklers at Jerusalem to Tiberias, Philo de legat. Petronius would have dedicated a statue to the emperor in the same city, *ibid*. p. 791. Tacitus, *Hist. lib. iv. c. 53*. mentions the dedication of the capital, upon rebuilding it by Vespasian, &c. The Jews celebrated the anniversary of the dedication of their temple every year for eight days. This was first enjoined by Judas Maccabeus, and the whole synagogue, in the year of the Syro-Macedonian era 148, i. e. 164 years before Christ. The heathens had similar anniversaries, as that of the dedication of the temple of Parthenope, mentioned by Lycophron. Under Christianity, dedication is only applied to a church; and is properly the consecration thereof performed by a bishop, with a number of ceremonies prescribed by the church. The Christians finding themselves at liberty under Constantine, in lieu of their ruinous churches, built new ones in every place; and dedicated them with a deal of solemnity. The dedication was usually performed in a synod; at least they assembled a number of bishops to assist at the service. We have the description of those of the churches at Jerusalem and Tyre in Eusebius, and many others in later writers.

DEDICATION, [*dedicatio*, Lat.] in literature, is an address prefixed to a book, soliciting patronage, or testifying respect for the person to whom it is made.

DEE, a river of England and Wales, which rises in the N. W. angle of Merionethshire, and falls into the Irish sea 15 miles below Chester.

DEE, a river of Ireland, which crosses the county of Louth.

DEE, a river of Scotland, in Aberdeenshire.

DEE, JOHN, a famous mathematician and astrologer, was born

at London in July 1527, where his father was a wealthy vintner. In 1542, he was sent to St. John's college, Cambridge. After five years close application to mathematical studies, particularly astronomy, he went to Holland, to visit several eminent mathematicians on the continent. Having continued abroad near a year, he returned to Cambridge; and was there elected one of the fellows of Trinity college, then first erected by king Henry VIII. In 1548, he took the degree of M.A. and left England a second time; his stay at home being rendered uneasy to him, by the suspicions that were entertained of his being a conjuror; arising partly from his application to astronomy, but especially on account of a piece of machinery in the *Enigma* of Aristophanes, which he exhibited to the university, and in which he represented the Scarabeus flying up to Jupiter, with a man, and a basket of victuals on its back. These suspicions he could never afterwards shake off; nor did his subsequent conduct, tend to clear him of the imputation; for if he was not actually a conjuror, it was not for want of endeavours. Upon leaving England, he went to the university of Louvain; where he was much esteemed, and visited by several persons of high rank. Here he resided about two years, and then set out for France; where, in the college of Rheims, he read lectures of Euclid's elements with vast applause. In 1551, he returned to England, and king Edward VI. assigned him a pension of 100 crowns, which he afterwards relinquished for the rectory of Upton upon Severn: but soon after the accession of queen Mary, having some correspondence with the lady Elizabeth's servants, he was accused of practising against the queen's life by enchantment. On this account he suffered a tedious confinement, and was several times examined; till, in 1555, he obtained his liberty by an order of council. Upon queen Elizabeth's accession, our astrologer was consulted by lord Dudley, concerning a propitious day for her coronation. He was, on this occasion, introduced to the queen, who made him great promises, which were never performed, though she condescended to receive his instructions relative to his unintelligible writings, which he published about this time. In 1564, he made another voyage to the continent; to present a book he had dedicated to the emperor Maximilian. He returned to England, but in 1571, we find him in Lorrain; where, being dangerously ill, the queen sent over two physicians to his relief. Having once more returned to his native country, he settled at Mortlake in Surrey, where he continued his studies with unremitting ardour, and collected a considerable library of curious books and MSS. with a variety of instruments; most of which were afterwards destroyed by the mob, as belonging to one who dealt with the devil. In 1578, the queen being much indisposed, Mr. Dee was sent abroad to consult with German physicians and philosophers (astrologers no doubt) on the occasion. We now behold him again in England, where he was soon after employed in a more rational service. The queen desirous to be informed concerning her title to those countries which had been discovered by her subjects, commanded Mr. Dee to consult the ancient records, and furnish her with proper geographical descriptions. Accordingly he presented her, in three weeks after, with two large rolls, in which the discovered countries were geographically described, and historically illustrated. These rolls are preserved in the Cottonian library. His next employment was the reformation of the calendar, on which subject he wrote a rational and learned treatise, preserved in the Ashmolean library at Oxford. Though Dee was undoubtedly a man of parts and learning, he became at last a credulous alchemist, and gave his mind to necromancy. In 1581, he fell acquainted with one Edward Kelley, by whose assistance he performed diverse incantations, and maintained a very frequent intercourse with spirits. He was, it is said, intimate with the angels Raphael and Gabriel. One of them made him a present of a black speculum, in which his angels and demons appeared as often as he had occasion for them; they answered his questions, and Kelley's business was to record their dictates. In 1583, they were both introduced to a Polish nobleman, then in England, named Albert Laski, palatine of Siradia, a person addicted to the same antichristian pursuits. He was so charmed with Dee and his companion, that he persuaded them to accompany him to his native country. They embarked for Holland in September 1593; and travelling overland, arrived at the town of Laski in February following. Their patron, however, finding himself abused by their abominations, persuaded them to pay a visit to the emperor Rodolph II.; who, in a very short time, was soon disgusted with

them. They were afterwards introduced to Stephen, king of Poland, but with no better success. Soon after this they were invited by a rich Bohemian nobleman, to his castle of Trebona, where they continued for some time in great affluence; owing, as they asserted, to their art of transmutation by means of a certain powder in the possession of Kelley. Dee now quarrelling with his companion in iniquity, quitted Bohemia, and returned to England, where he was once more graciously received by the queen; who, in 1595, made him warden of Manchester college, in which town he resided several years. In 1604, he returned to his house at Mortlake, where he died in 1608, aged 81, leaving a large family, and many works, behind him. The black stone into which Dee used to call his spirits, was in the collection of the earls of Peterborough, whence it came to Lady Elizabeth Germaine. It was next the property of the late duke of Argyle, and is now Mr. Walpole's. It has been found upon examination to be nothing but a polished piece of cannel coal. The celebrated Dr. Hook, many years after Dee's death, has endeavoured to prove that his journal, published by Casaubon, was entirely cryptographical, concealing his political transactions, and that under the mask of pursuing the occult sciences, he was employed by queen Elizabeth as a spy. He is said to have been created LL. D. at Louvain.

DEED, an instrument written on paper or parchment, which relates principally to the conveyance, or transferring of property, and the validity of which consists in the following essential particulars: 1. Proper parties to contract with one another, and a proper subject matter to be contracted for; 2. A good and sufficient consideration; 3. Writing on parchment, or paper, duly stamped; 4. Sufficient and legal words, properly disposed; 5. Reading (if it be desired) before execution; 6. By stat. 29 Car. 2. c. 3, in many cases signing also; and, lastly, delivery which must be done either by the party himself, or by his attorney, lawfully authorized, and expressed in the attestation. If any of these requisites be wanting, the deed is absolutely void, from the beginning. The preservation of deeds is an object that has ever engaged the attention of the lawyer and the antiquary: it is of still greater importance to those who hold estates or other tenements, in order to enable them to peruse such papers as have been kept for a series of years, and which from moisture, or other causes, are almost illegible. To facilitate this desirable object, we select the following, as being the most simple of the many recipes which have been recommended: immerse the parchment obliterated by time, into a vessel of cold water, fresh drawn from a well: in the space of a minute, it should be taken out, and pressed between two blotting papers, to prevent it from shrivelling, while it is drying. As soon as it is moderately dry (if the characters be not legible,) the operation should be repeated two or three times. Thus, the skin will resume its pristine colour, and appear throughout alike. In construction of law, the first deed and the last will stand in force; and where a deed is by indenture between parties, none can have an action upon such deed, but the person who is a party to it. In a deed-poll, however, one person may covenant with another, who is not a party, to do certain acts; for the non-performance of which he may bring his action. Where a man justifies title under any deed, he ought to produce that deed; if it be alleged in pleading, it must be produced to the court, that it may determine whether the deed contain sufficient words to make a valid contract.

DEEMSTERS, or **DEMSTERS**, [from *dema*, Sax. a judge or umpire,] all controversies in the Isle of Man are decided without process, writings, or any charges, by certain judges, chosen yearly from among themselves, called deemsters; there being two for each division of the island: they sit judges in all courts, either for life or property; and with the advice of 24 keys, declare what is law in uncommon emergencies.

DEEP SEA-LINE, or **DIP SEA-LINE**, in the sea-language a small line to sound with: some a hundred and fifty fathoms long, with a hollow plummet at the head, and tallow put into it, to bring up stones, gravel, sand, shells, and the like, from the bottom, in order to know the differences of the ground; which being entered from time to time in their books, by comparing of observations, they guess by their soundings, &c. what coasts they are on, though they cannot see land.

DEER, an island of the United States, in Penobscot Bay, on the coast of Hancock county, in the district of Maine, 19 miles in circumference.

DEER, [*deor*, Sax. *thier*, Teutonic; *θῆρ*, Gr.] that class of

animals which is hunted for venison, containing many subordinate species; as the stag, or red deer, the buck, or fallow deer, the roebuck, and others. See **CERVUS**.

DEERFIELD, a town of New Hampshire 35 miles N. W. of Portsmouth.

DEERFIELD, or **POCOMTIC**, a river of Vermont, which receiving many streams, enters Massachusetts, thence falls into the Connecticut.

DE FACTO, [Lat.] something actually in fact, or existing; in contradistinction to *de jure*, where a thing is only so in justice, but not in fact: as a king *de facto* is a person who is actually in possession of a crown, but has no legal right to the same; and a king *de jure* is the person who has a just right to the crown, though he is not possessed of it.

DEFAMATION, the offence of speaking slanderous words of another; and where any person circulates any report injurious to the credit or character of another, the party injured may bring an action to recover damages proportioned to the injury he has sustained; but it is incumbent upon the party to prove that he has sustained an injury, to entitle him to damages. In some cases, however, as for words spoken which, by law, are in themselves actionable, as calling a tradesman a bankrupt, a cheat, or swindler, &c. there is no occasion to prove any particular damage, but the plaintiff must be particularly attentive to state words precisely as they were spoken, otherwise he will be nonsuited.

DEFAULT, is commonly taken for non-appearance in court at a day assigned. If a plaintiff make default in appearance in a trial at law, he will be nonsuited; and where a defendant makes a default, judgement shall be had against him by default.

DEFAULT IN CRIMINAL CASES. If an offender, being indicted, appears at the *capias*, and pleads to issue, and is let to bail to attend his trial, and then makes default; here the inquest, in case of felony, shall never be taken by default: but a *capias ad audiendum juratum* shall issue, and if the party is not taken, an exigent; and if he appear on that writ, and then makes default, an *exigi facias de novo* may be granted: but where, upon the *capias* on exigent, the sheriff returns *cepi corpus*, and at the day has not his body, the sheriff shall be punished; but no new exigent awarded because in custody of record. 2 H. H. 202.

DEFAULT OF JURORS. If jurors make default in their appearance for trying of causes, they shall forfeit their issues, unless they have any reasonable excuse proved by witnesses, in which case the justices may discharge the issues for default. Stat. 35 H. VIII. c. 6.

DEFEASANCE, or **DEFEISANCE**, the difference between a common condition and a defeasance is, that the condition is annexed to, or inserted in, the deed; and a defeasance is a deed by itself, concluded and agreed on between the parties, and having relation to another deed.

DEFECATE, or **DEFECATE**, in chemistry, a term applied to a body freed and purged from feces and impurities. See the article **CLARIFICATION**, &c.

DEFECTION, the deserting, abandoning, or falling off from, a party, or interest, a person had been engaged in.

DEFECTIVE, in general, an appellation given to things which want some of the properties that naturally they ought to have. Thus,

DEFECTIVE NOUNS are those which want one of the numbers, or one or more cases. See **NOUN**.

DEFENCE, in fortification, all sorts of works that cover and defend the opposite posts, as flanks, casemates, parapets, and *faussebrays*. See **FORTIFICATION**.

DEFENCE, TO BE IN A POSTURE OF, is to be in a condition to resist or oppose an enemy.

DEFENCE, LINE OF, a supposed line drawn from the angle of the curtain, or from any other part in the curtain, to the flanked angle of the opposite bastion. See **FORTIFICATION**.

DEFENCE, in law, signifies a plea, or what the defendant ought to make after the plaintiff's count, or declaration, viz. that he defends all the wrong, force, and damages, where and when he ought, &c. If the defendant would plead to the jurisdiction, he must omit the words, where and when he ought; and if he would shew any disability in the plaintiff, and demand judgement, if the plaintiff shall be answered unto, then he ought to omit the defence of the damage. There is a full defence usually in personal actions.

DEFENCES,

DEFENCES, in heraldry, are the weapons of any beast, as the horns of a stag, the tusks of a wild boar, &c.

DEFEND, a term used in our old statutes, for, to prohibit or forbid.

DEFENDANT, in law, the person sued in an action personal; as tenant is he who is sued in an action real. See ACTION.

DEFENDEMUS, in law, a word formerly used in gifts and grants, having this force, that it binds the donor and his heirs to defend the donee, if any persons claimed right to, or laid any incumbrance on, the thing given, otherwise than is contained in the deed of gift.

DEFENDER OF THE FAITH, [*fidei defensor*, Lat.] a peculiar title belonging to the king of England; as Catholicus to the king of Spain, and Christianissimus to the king of France, &c. These titles were given by the popes of Rome. That of *fidei defensor* was first conferred by Leo X. on king Henry VIII. for writing against Martin Luther; and the bull for it bears date quinto idus Octob. 1521. It was afterwards confirmed by Clement VII. But the pope, on Henry's suppressing the houses of religion at the time of the reformation, not only deprived him of his title, but deposed him from his crown also; though in the 35th year of his reign, his title, &c. was confirmed by parliament; and has continued to be used by all his successors. Chamberlayne says, the title belonged to the kings of England before that time; and for proof hereof appeals to several charters granted to the university of Oxford; so that pope Leo's bull was only a renovation of the ancient right.

DEFICIENT NUMBERS, in arithmetic, are those numbers whose parts, added together, make less than the integer, whose parts they are, such is 8, its parts 1, 2, 4, making only 7.

DEFILE, in fortification, a straight narrow passage, through which a company of horse or foot can pass only in file, by making a small front; so that the enemy may take an opportunity to stop their march and charge them with so much the more advantage, in regard that those in the front and rear, cannot reciprocally come to the relief of one another.

DEFILE is to reduce an army to a small front, in order to march through a defile.

DEFINITE, in grammar, is applied to an article that has a precise determinate signification; such as the article *the* in English, *le* and *la* in French, &c. which fix and ascertain the noun they belong to, to some particular; the king, *le roi*, the queen, *la reine*, *i. e.* the king or queen of the country we are in, or speaking of; whereas the articles, *a*, *an*, *un* or *une*, mark nothing particular, and are therefore called indefinite: thus a king, an artist, un roi, une reine, mean a king, artist, or queen, of any country or any age.

DEFINITION, the shewing the meaning of one word by several other not synonymous terms. The meaning of words being only the ideas they are made to stand for, by him that uses them, the meaning of any term is then shewed, or the word is defined, when, by other words, the idea it is made the sign of, and is annexed to it in the mind of the speaker, is, as it were, represented and set before the view of another; and thus its signification is ascertained. This is the only end and use of definitions, and therefore the only measure of what is, or is not, a good definition. The names then of simple ideas are incapable of being defined, because the several terms of a definition signifying several ideas, they can altogether by no means, represent an idea which has no composition at all; and therefore a definition, which is properly but shewing the meaning of any one word by several others, not signifying the same each, can in the names of the simple ideas have no place. Definitions, which then take place in compound ideas only are of two sorts: the definition of the name, which is the explanation of what any word means; and the definition of the thing, which explains in what the nature of that thing consists. In order to form a definition of any thing, we must employ these three acts of the mind, first compare the thing to be defined with other things that are most like to itself, and see wherein its essence and nature agrees with them; and that is called the general nature or genus in a definition: so, if you would define what wine is, first compare it with other things like itself, as cyder, perry, &c. and you will find that it agrees essentially with them in this, that it is a sort of juice. Secondly, consider the most remarkable and primary attribute, property, or idea, wherein the thing differs from

those other things that are most like it, and that is its essential or specific difference: so that wine differs from cyder and perry, and all other juices, in its being pressed from a grape. This may be called its special nature, which distinguishes it from other juices. Thirdly, join the general and special nature together, or the genus and the difference, and these make up a definition; so the juice of a grape, or juice pressed from grapes, is the definition of wine. Here it must be observed, that in speaking of the genus and difference, as composing a definition, it must always be understood, that the nearest genus and specific difference are required. The next general nature, or the nearest genus, must be used in a definition, because it includes all the rest: as if I were to define wine, I must say, wine is a juice, which is the nearest genus; and not say, wine is a liquid, which is a remote general nature; or, wine is a substance which is yet more remote, for juice includes both liquid and substance. Besides neither of these two remote general natures would make any distinction between wine and a thousand other substances, or other liquids: a remote genus leaves the thing too much undistinguished. The specific difference is that primary attribute which distinguishes each species from one another, while they stand ranked under the same general nature or genus; so that the specific difference of wine is its pressure from the grape, as cyder is pressed from apples, and perry from pears. In definitions we must also use the primary attribute that distinguishes the species, or special nature; and not attempt to define wine by its particular tastes, or effects, or rather properties, which are but secondary, or consequential, when its pressure from the grape is the most obvious and primary distinction of it from all other juices. In some cases, indeed, it is not so easily known, which is the primary idea that distinguishes one thing from another; so some would as soon define winter by the coldness of the season, as by the shortness of the days, though the shortness of the days is doubtless the most just, primary, and philosophical difference; since winter-days are always the shortest, but not always the coldest; besides, the shortness is one cause of the coldness, but the coldness is no cause of their shortness. The special rules for a good definition are these: 1. A definition must be universal or adequate, that is, it must agree to all the particular species or individuals that are included under the same idea. 2. It must be proper, and peculiar to the thing defined, and agree to that alone. These two rules, being observed, will always render a definition reciprocal with the thing defined, that is, the definition may be used in the place of the thing defined; or they may be mutually affirmed concerning each other. 3. A definition should be clear and plain; and indeed it is a general rule concerning the definition both of names and things, that no word should be used in either of them, which has any difficulty in it, unless it has been before defined. 4. A definition should be short, so that it must have no tautology in it, nor any words superfluous. 5. Neither the thing defined, nor a mere synonymous name should make any part of the definition. Though the defining by the genus and difference be the shortest way, yet it may be doubted whether it be the best; certainly it is not the only, and so not absolutely necessary. Thus, man may be defined to be a solid extended substance, having life, sense, spontaneous motion, and the faculty of reasoning; and certainly the meaning of the word man would be as well understood as when it is defined a rational animal.

DEFINITION, in rhetoric, is defined by Cicero, a short comprehensive explanation of a thing. The definitions of the orator, it must be observed, differ much from those of the logician and philosopher: the orators take a large compass, and define things more ornamentally: thus, "man is a curious work of an almighty Creator, framed after his own image, endued with reason, and born with immortality:" but this rhetorical definition, in strictness, comes nearer to the nature of a description, than any accurate definition.

DEFLAGRATION, [*deflagratio*, Lat.] in chemistry, the act of burning two or more substances together, as charcoal and nitre. When nitre, (nitrate of potash,) is mixed with an equal weight of sulphur, charcoal, or other inflammable substance, and the mixture is thrown into a crucible heated to redness, a very vivid combustion is instantly excited: this is called deflagration, which is occasioned by the disengagement of a large portion of oxygen, from the nitre thus suddenly presented to the inflammable body, and hence the vivid combustion that is excited; and for the production of this, it is not even requisite to raise the temperature so high as that which would be necessary, if applied alone, to decom-

pose the nitre, the affinity of the inflammable body to the oxygen of the nitre, causing it to take place at a temperature somewhat lower. The nitrogen, or azote of the nitric acid, passes off in the state of gas, and the potash with which the acid was united, remains mixed, or united with the body formed by the combination of the oxygen, and the inflammable substance.

DEFLECTION OF THE RAYS OF LIGHT, a property which Dr. Hook observed in 1675, and read an account of before the Royal Society, March 18, the same year. He says he found it different both from reflection and refraction, and that it was made towards the surface of the opaque body, perpendicularly. This property Sir Isaac Newton calls inflection.

DEFLECTION, in navigation, the tendency of a ship from her true course, by reason of currents, &c. which turn her out of her right way.

DE FOE, DANIEL, a writer famous for politics and poetry. He was bred a hosier, which profession he soon forsook, and became one of the most enterprising authors that any age has produced. When discontents ran high at the Revolution, and king William was obliged to dismiss his Dutch guards, De Foe, who had true notions of civil liberty, ridiculed the enemies of government in his well known poem, called "The true-born Englishman;" which had a prodigious sale. The next satire he wrote was intitled, "Reformation of Manners;" aimed at some persons of high rank, who rendered themselves a disgrace to their country. When the ecclesiastics breathed too much of a spirit of persecution, De Foe wrote a tract called "The Shortest Way with the Dissenters;" for which he was called to account, and explained himself with great firmness. He was afterwards sentenced to the pillory for attacking some public measures; which so little intimidated him, that, in defiance of their usage, he wrote a "Hymn to the Pillory." It would be endless to enumerate all his publications; but the following are the principal: "The History of the Plague in 1665;" a novel intitled "The History of Colonel Jack;" "A new Voyage round the World by a Company of Merchants," printed for Bettesworth, 1725; "The History of Roxana;" "Memoirs of a Cavalier;" "The History of Moll Flanders;" a religious romance, intitled "Religious Courtship," which has undergone upwards of 20 editions; and the "Life and Adventures of Robinson Crusoe, an admirable performance, of which there have been editions without number, but concerning which there is an anecdote, that does the author of it no credit, as to the better part of a writer's character, honesty. When Captain Woods Rogers touched at the island of Juan Fernandez, in the South Sea, he brought away Alexander Selkirk, a Scots sailor, who had been left ashore there, and had lived on that desolate place above four years. When Selkirk came back to England, he wrote a narrative of his adventures, and put the papers into the hands of De Foe, to digest for publication; who ungenerously converted the materials into the History of Robinson Crusoe, and returned Selkirk his papers again! A fraud for which, the distinguished merit of that romance can never atone. Daniel de Foe died at Islington, in 1731. All his productions of the romantic species, but especially the two last mentioned, are much in vogue amongst country readers; and, on account of their moral and religious tendency, may very probably in some measure counteract the pernicious effects, produced by the too general circulation of modern novels, those occasional vehicles of impiety and infidelity.

DEFOLIATION, [from *de*, and *folium*, a leaf,] the fall of the leaves; a term opposed to frondescentia, the annual renovation of the leaves. Most plants in cold and temperate climates shed their leaves every year: this happens in autumn, and is generally announced by the flowering of the common meadow-saffron. The term is only applied to trees and shrubs; for herbs perish down to the root every year, losing stem, leaves, and all. All plants do not drop their leaves at the same time. The ash and walnut trees, though latest in unfolding, are soonest divested of them: the latter seldom carries its leaves above five months. On the oak and hornbeam, the leaves die and wither as soon as the cold commences; but remain attached to the branches till they are pushed off by the new ones, which unfold themselves the following spring. These trees are doubtless a kind of ever-greens: the leaves are probably destroyed only by cold; and perhaps would continue longer on the plant, but for the force of the spring sap, joined to the moisture. In mild and dry seasons,

the lilac, privet, yellow jessamine of the woods, and maple of Crete, preserve their leaves green until spring, and do not drop them till the new leaves are beginning to appear. The fig-tree, and many other trees that grow between the tropics, are of this particular class of ever-greens. The trees in Egypt, says Dr. Hasselquist, cast their leaves in the end of December and beginning of January having young leaves before all the old ones are fallen off; and, to forward this operation, few of the trees have buds: the sycamore, and willow, indeed, have some, but with few and quite loose stipules or scales. Buds seem not so necessary in the southern as in the northern countries. Some trees and shrubs preserve their leaves constantly through the whole year: and are not in the least influenced by the clemency or inclemency of seasons. Such are the fir, juniper, yew, cedar, cypress, and many other trees, hence denominated ever-greens. The falling off of the leaves of deciduous trees seems principally to depend on the temperature of the atmosphere, which likewise serves to hasten or retard the appearance in question. An ardent sun contributes to hasten the dropping of the leaves. Hence in hot and dry summers, the leaves of the lime-tree and horse-chesnut turn yellow about the first of September; whilst in other years, the yellowness does not appear till the beginning of October. Nothing, however, contributes more to hasten the fall of the leaves, than immoderate cold or moist weather in autumn; moderate droughts, on the other hand, serve to retard it. As a proof of this position, Mr. Adanson relates, that in 1759, the leaves of the elm-tree, which generally fall off about the 25th of November, continued in verdure and vigour at Paris, where the autumn was remarkably dry, till the 10th of the following month. The following table, respecting the mean times in which different trees shed their leaves, is founded upon observations:

Gooseberry-tree and bladder-sena,	} Generally quit their leaves about	Oct. 1st.
Walnut and ash,		—15th.
Almond-tree; horse-chesnut, and lime-tree,		—20th.
Maple, hazle nut, black poplar, and aspen tree,		—25th.
Birch, plane-tree, mountain osier, false acacia, pear, and apple tree,		Nov. 1st.
Vine, mulberry, fig, sumac, and angelica tree,	}	—10th.
Elm-tree and willow,		—15th.
Apricot and eldertrees,		—20th.

It is remarkable that an ever-green tree grafted upon a deciduous, determines the latter to retain its leaves. This observation is confirmed by repeated experiments; particularly by grafting the laurel, or cherry-bay, an ever-green, on the common cherry; and the ilex, or ever-green oak, on the oak.

DEFORCEMENT, a with-holding of lands and tenements by force from the right owner.

DEFORCEMENT, in Scots law, the opposing or resisting of the officers of the law in the execution of their office.

DEFORMITY, [*deformitas*, Lat.] generally signifies the want of that symmetry and uniformity, which are necessary to constitute the beauty of an object; it is more particularly applied to the human frame. The chief cause of the personal deformity so frequent at present, is the neglect of paying proper attention to the clothing of infants, by which they are deprived of the free use of their limbs; and thus, in a great measure, rendered unserviceable to society. But, though deformity may apparently be prejudicial to health, it is ultimately a real advantage. Deformed persons, it is true, possess a less share of strength than others; they should therefore be naturally more careful to preserve it, as well as their health; which can be effected only by a strict adherence to temperance. This object will likewise be considerably facilitated by moderate exercise, which few, in such a situation, can want strength to perform; and, as they are not calculated for violent exercise, they are consequently exempt from all the disorders arising from that source; and may thus attain a mature old age. For a further investigation of this subject, we refer the reader to an ingenious essay, intitled "Deformity," by Mr. Hay, in 8vo. published in the year 1753, and of which a new edition appeared a few years since, collectively with his other works, in two vols. 4to. where it is amply discussed.

DEFOSSIO, or **DEFOSSION**, the punishment of burying alive, inflicted among the Romans on vestal virgins guilty of incontinency. It is also a custom among the Hungarians to inflict this punishment on women convicted of adultery. Heretics were also punished in this manner.

DEGENERATION OF PLANTS. Some naturalists have been of opinion, that plants are capable of degenerating into quite indistinct species; but this is a mere chimera. All that happens in the degeneration of a plant, is the losing its usual beauty, colour, smell, &c. a circumstance entirely owing to its being planted in an improper soil, climate, &c.

DEGLUTITION, in medicine, the act of swallowing the food, performed by means of the tongue driving the aliment into the œsophagus, which, by the contraction of the sphincter, protrudes the contents downwards.

DEGNIZLU, or **DENIZSLEY,** a town of Asiatic Turkey, in the province of Natolia, 108 miles E. S. E. of Smyrna.

DEGRADATION, the act of depriving a person for ever of a dignity or degree of honour, and taking away the title, badge, and privileges, of it.

DEGRADATION, in our law-books, is called Disgradation and Deposition. The degradation of a peer, a priest, a knight, a gentleman, an officer, &c. are performed with divers ceremonies, in which the person degraded is stripped of those ornaments and rights which were the ensigns of his order and degree.

DEGRADATION, in painting, expresses the lessening the appearance of distant objects in a landscape, in the same manner as they would appear to an eye placed at that distance from them.

DEGRADED CROSS, in heraldry, a cross divided into steps at each end, diminishing as they ascend towards the centre, called by the French *perronnée*.

DEGREE, [*dégré* Fr.] in geometry, a division of a circle, including a three hundred and sixtieth part of its circumference. Every circle is supposed to be divided into three hundred and sixty parts, called degrees, and each degree divided into sixty other parts, called minutes; each of these minutes being again divided into sixty seconds, each second into sixty thirds, and each third into sixty fourths, and so on. By this means no more degrees or parts are reckoned in the greatest circle than in the least that is; and therefore if the same angle at the centre be subtended by two concentric arches, as many degrees are counted in the one as in the other; for these two arches have the same proportion to their whole peripheries. See **TRIGONOMETRY**.

DEGREE OF LATITUDE, and **DEGREE OF LONGITUDE.** See **LATITUDE**, **LONGITUDE**, **GEOGRAPHY**, and **ASTRONOMY**.

DEGREE, in the civil and canon laws, denotes an interval in kinship, by which proximity, and remoteness of blood are computed. See **CONSANGUINITY**, and **DESCENT**.

DEGREE, in universities, denotes a quality conferred on the students or members thereof, as a testimony of their proficiency in the arts or sciences, and intitling them to certain privileges. The degrees are much the same in all universities, but the laws thereof, and the previous discipline or exercise differ. The degrees are bachelor, master, and doctor, instead of which last, in some foreign universities, they have licentiate. In each faculty, there are two degrees, bachelor and doctor, which were antiently called bachelor and master. In the arts likewise there are two degrees which still retain the antient denomination, viz. bachelor and master. With regard to obtaining degrees at Oxford and Cambridge, matters are nearly on the same footing, only at Cambridge the discipline is somewhat more severe, and the exercises more difficult. For the degree of bachelor of arts, besides residence in the university near four years, it is required that the person in the last year have defended three questions in natural philosophy, mathematics, or ethics, and answered the objections of three several opponents at two several times; as also that he have opposed three times. After which, being examined by the master and fellows of the college, he is referred to seek his degree in the schools, where he is to sit three days, and be examined by two masters of arts appointed for the purpose. For the degree of master of arts, the candidate is obliged three several times to maintain two philosophical questions in the public schools, and to answer the objections brought against him by a master of arts. He must also keep two acts in the bachelors school, and declaim once. To pass bachelor of divinity, the candidate must have been seven years master of arts: he must have opposed a bachelor of divinity twice, kept one divinity act, and preached before the university once in Latin and once in English. For the degree of doctor, see **DOCTOR**.

DEGREES OF COMPARISON, in grammar, are three; viz. the positive, comparative, and superlative. See **GRAMMAR**.

DEGREES, in music, are the little intervals whereof the concords, or harmonical intervals, are composed. Musical degrees are three, 1st. The greater tone, whose ratio is 8:9. 2. The less tone, whose ratio is 9:10. and 3. The semitone, whose ratio is 15:16.

DEJANIRA, in fabulous history, daughter of Oeneus king of Etolia, and wife of Hercules. The centaur Nessus, endeavouring to ravish her, was slain by Hercules with a poisoned arrow.

DEINSE or **DEYNSE,** a town of France in the department of Escaut, 9 miles S. W. of Ghent.

DEIPHON, in fabulous history, a brother of Triptolemus, and son of Celeus and Metanira. When Ceres travelled over the world, she stopped at his father's court, and undertook to nurse him and bring him up. To reward the hospitality of Celeus, the goddess, to make his son immortal, every evening placed him on burning coals, to purify him from his mortal particles.

DEISCAL or **DEISHEAL,** in the ancient British customs, the name of a ceremony originally used in the druidical worship, and retained in many places down to a very late period as a civil ceremony towards persons of particular distinction. The temples of the ancient Britons were all circular; and the druids in performing the public offices of their religion, never neglected to make three turns round the altar, accompanied by all the worshippers. This practice was so habitual to the ancient Britons, that it continued in some places many ages after the druids and their religion were both destroyed. In the Scottish isles, the vulgar never came to the ancient sacrificing and fire-hallowing cairns, but they walk three times round them, from east to west, according to the course of the sun.

DEISM [*déisme*, Fr. from *Deus*, God, Lat.] may properly be used to denote natural religion, as comprehending those truths which have a real foundation in reason and nature; and in this sense it is so far from being opposite to Christianity, that it is one great design of the gospel to illustrate and enforce it. Thus some of the deistical writers have affected to use it. But deism more precisely signifies that system of religion relating both to doctrine and practice, which, it is supposed, every man may discover for himself, by the mere force of natural reason, independent of all revelation, and exclusive of it; and this religion, Dr. Tindal and others pretend, is so perfect, as to be incapable of receiving any addition or improvement even from divine revelation. It is indeed surprising, that men of learning and philosophy, who reject Christianity, on account of its miracles and mysteries, See **DEISTS**, notwithstanding its many evidences external and internal, should nevertheless adopt opinions, without the smallest evidence, which, if they were true, would be not only more miraculous, but even more mysterious, because paradoxical and contradictory. For miraculous it certainly would be, if a finite, limited, foolish, imperfect, material, being, whose days are of yesterday, and whose whole mass of knowledge is acquired from external and visible objects, through the medium of his five senses, could, by his own powers alone, discover the existence, nature, powers, and character, of an infinitely and eternally wise, good, perfect, unlimited, immaterial, and invisible, Being, without the smallest information or revelation from him. And it is a self-evident contradiction, to say, that such a weak and imperfect being could discover, or (what, in matters of this kind, amounts to the same thing,) form a system of religion and morality, so perfectly pure and excellent, that the omnipotent Author of all wisdom, goodness, and perfection, could not improve it, or give a better in its stead. Yet such contradictory systems are adopted as sterling truths, by many modern deists: which affords the Christian a strong proof of the truth of our Saviour's prophecy, that at his second coming he will hardly find faith on the earth.

DEIST, a sect or class of people also denominated **FREE-THINKERS**; they profess to think freely for themselves; and to follow the light and law of nature, rejecting revelation, and opposing Christianity. The name of Deists seems to have been first assumed as the denomination of a party, about the middle of the 16th century, by some gentlemen in France and Italy, who were desirous of thus disguising their opposition to Christianity, by a more honourable appellation than that of Atheists. Viret, an eminent reformer, mentions certain persons, in his epistle dedicatory, prefixed to the second volume of his "Instruction Chrétienne," published in 1563, who called themselves by a new name, that

that of Deists. These, he tells us, professed to believe in God, but shewed no regard to Jesus Christ, and considered the doctrine of the apostles and evangelists as fables and dreams. He adds, that they laughed at all religion, though they outwardly conformed to the religion of those with whom they lived, or whom they wished to please, or feared to offend. Some, he observed, professed to believe the immortality of the soul; others denied both this doctrine and that of providence. Many of them were considered as persons of acute and subtil genius, and took pains in disseminating their notions. The deists hold, that, considering the multiplicity of religions, the numerous pretences to revelation, and the precarious arguments generally advanced in proof thereof, the best and surest way is to return to the simplicity of nature and the belief of one God; which is the only truth agreed to by all nations. They complain, that the freedom of thinking and reasoning is oppressed under the yoke of religion; and that the minds of men are tyrannized over, by the necessity imposed on them of believing inconceivable mysteries; and contend that nothing should be required to be assented to or believed, but what their reason clearly conceives. The distinguishing character of modern deists is, that they discard all pretences to revelation, as the effects of imposture or enthusiasm. They profess a regard for natural religion, though they are far from being agreed in their notions concerning it. They are classed by some of their own writers into mortal and immortal deists; the latter acknowledging a future state; and the former denying it, or representing it as very uncertain. Dr. Clarke distinguishes four sorts of deists. 1. Those who pretend to believe the existence of an eternal, infinite, independent, intelligent Being, who made the world, without concerning himself in the government of it. 2. Those who believe the being and natural providence of God, but deny the difference of actions as morally good or evil, resolving it into the arbitrary constitution of human laws; and therefore they suppose that God takes no notice of them. With respect to both these classes, he observes, that their opinions can consistently terminate in nothing but downright atheism. 3. Those who having right apprehensions concerning the nature, attributes, and all-governing providence of God, seem also to have some notion of his moral perfections; though they consider them as transcendent, and such in nature and degree, that we can form no true judgement, nor argue with any certainty concerning them: but they deny the immortality of human souls; alleging that men perish at death, and that the present life is the whole of human existence. 4. Those who believe the existence, perfections, and providence, of God, the obligations of natural religion, and a state of future retribution, on the evidence of the light of nature, without a divine revelation; such as these, he says, are the only true deists; but their principles, he apprehends, should lead them to embrace Christianity; and therefore he concludes that there is now no consistent scheme of deism in the world. The first deistical writer of any note that appeared in this country was Herbert baron of Cherbury. He lived and wrote in the seventeenth century. His book "De Veritate" was first published at Paris in 1624. This, together with his book "De Causis Errorum," and his treatise "De Religione Laici," were afterwards published in London. His celebrated work "De Religione Gentilium" was published at Amsterdam in 1663 in 4to, and in 1700 in 8vo.; and an English translation of it was published at London in 1705. As he was one of the first that formed deism into a system, and asserted the sufficiency, universality, and absolute perfection, of natural religion, with a view to discard all extraordinary revelation as useless and needless, we shall subjoin the five fundamental articles of this universal religion. They are these: 1. That there is one supreme God. 2. That he is chiefly to be worshipped. 3. That piety and virtue are the principal part of his worship. 4. That we must repent of our sins; and if we do so, God will pardon them. 5. That there are rewards for good men and punishments for bad men, both here and hereafter. Our own age has produced a number of advocates in the same cause; and however they may have differed among themselves, they have been agreed in their attempts of invalidating the evidence and authority of divine revelation. We might mention Hobbes, Blount, Toland, Collins, Woolston, Tindal, Morgan, Chubb, Lord Bolingbroke, Hume, Gibbon, Paine, &c. Some have added Lord Shaftesbury, and the late Lord Kaimes, to the number. Among foreigners, Voltaire, Rousseau, Condorcet, and many other celebrated French

authors, have rendered themselves conspicuous by their deistical writings. But the friends of Christianity have no reason to regret the free and unreserved discussion which their religion has undergone. Objections have been stated and urged in their full force, and as fully answered; arguments and railery have been repelled; and the controversy between Christians and Deists has called forth a great number of excellent writers, who have illustrated both the doctrines and evidences of Christianity, in a manner that will ever reflect honour on their names, and be of lasting service to the cause of genuine religion, and the best interests of mankind. With all their boast of reason, the deists, have not been able to produce one solid argument to invalidate revelation, or the Christian doctrine of salvation as delivered in the gospel. On the other hand, the truth of revelation has been evinced by the clearest, and most solid arguments, which were ever urged in favour of any truth. We shall here add this advice, viz. let him who wishes to be fully assured of the truth of revelation, attend, in simplicity and sincerity of heart to its doctrines and precepts, and he will experience its efficacy so as fully to be satisfied, that it is of God and not of man.

DE-LA-WAR, a town of Virginia, in King William's county, 20 miles N. by W. of Williamsbury.

DELAWARE, a river of the United States, which was called Chihohocki by the aboriginals, and in an old Nuremburg map is named Zuydt river. It rises by two principal head waters in New York state.

DELAWARE, one of the United States of N. America, situated between 38° 29' 30" and 39° 54' N. lat. and between 75° and 75° 48' W. lon. being in length 92 miles, and in breadth 24, containing 2000 square miles, or 1,200,000 acres. This state derived its name from Lord De-La-War, who was instrumental in establishing the first settlement of Virginia. It is divided into three counties, Newcastle, Kent, and Sussex; whose chief towns are Wilmington, Newcastle, Dover, Milford, and Lewes. Dover is the seat of government. The state of Delaware, the upper parts of the county of Newcastle excepted, are in general low and level. It is chiefly an agricultural state, including a very fertile tract of country; and scarcely any part of the United States is better adapted to the different purposes of agriculture, or in which a greater variety of the most useful productions can be conveniently and plentifully reared. This state produces plentiful crops of Indian corn, barley, rye, oats, flax, buck wheat, and potatoes. It abounds in natural and artificial meadows, containing a very large variety of grasses. Hemp, cotton, and silk, if properly attended to, would thrive well.

DELAWARE BAY is 60 miles long, from the cape to the entrance of the river, Delaware, at Bombay Hook; and occupies a space of about 630,000 acres. It is so wide in some parts, that a ship, in the middle of it, cannot be seen from the land. It opens into the Atlantic on the N. W. and S. E. between Cape Henlopen on the right, and Cape May on the left; which are 18 or 20 miles apart.

DELAWARE COUNTY, in Pennsylvania, is S. W. of Philadelphia county, on Delaware river.

DELAWARE COUNTY, a new county in the state of New York, on the head waters of Delaware river, taken from Otsego county.

DELAWARES, a nation of North American Indians, formerly numerous and powerful, and who possessed part of Pennsylvania, New Jersey, and New York. This name was given them by the Europeans; for they call themselves Lennilenape, that is, Indian men; or Woapanachky, which signifies a people living towards the rising sun. They now reside about half-way between lake Erie and Ohio river.

DELEGATES, COURT OF, a court wherein all causes of appeal, by way of devolution from either of the archbishops, are decided. This is the great court of appeal in all ecclesiastical causes. These delegates are appointed by the king's commission under his great seal, and issuing out of chancery, to represent his royal person, and hear all appeals to him made by virtue of the statute 25 Henry VIII. cap. 19. This commission is usually filled with lords spiritual and temporal, judges of the courts at Westminster, and doctors of the civil law. Appeals to Rome were always looked upon by the English nation, even in the times of Popery, with an evil eye, as being contrary to the liberty of the subject, the honour of the crown, and the independence of the whole

whole realm; and were first introduced in very turbulent times, in the 16th year of King Stephen, (A. D. 1151,) at the same period (Sir Henry Spelman observes,) that the civil and canon laws were first imported into England. However, the custom of appealing to Rome in causes ecclesiastical were so prevalent, that it never could be thoroughly broken off, till the grand rupture happened in the reign of Henry VIII. when all the jurisdiction usurped by the Pope in matters ecclesiastical was restored to the crown, to which it originally belonged: so that the statute 25 Henry VIII. was but declaratory of the ancient law of the realm. But in case the king himself be party in any of these suits, the appeal does not then lie to him in chancery, which would be absurd; but, by the 24 Henry VIII. cap. 12, to all the bishops of the realm, assembled in the upper house of convocation.

DELEGATION, in law, a commission extraordinary given by a judge to take cognisance of, and determine some cause, which ordinarily does not come before him.

DELEGATION, in Scots law, the extinguishing an obligation on a former debtor, by another becoming bound in his place.

DELFINO, a town of European Turkey, in Albania, 356 miles west of Constantinople, and 60 S. S. W. of Edessa.

DELFT, one of the eight departments into which the Batavian republic, was divided in March 1798. Delft is the capital. It is pleasantly situated among the meadows on the river Schie, 3 miles N. W. of Rotterdam.

DELFT WARE, a kind of pottery of baked earth, covered with an enamel or white glazing, which gives it the appearance and neatness of porcelain. Some kinds of it differ much from others, either in sustaining sudden heat without breaking, or in the beauty and regularity of their forms, of their enamel, and of the painting with which they are ornamented. In general, the fine and beautiful enamelled potteries, which approach the nearest to porcelain in external appearance, are least able to resist a brisk fire. Those which best sustain a sudden heat, are coarse, and resemble common pottery. The basis of this pottery is clay, which is to be mixed, when too fat, with such a quantity of sand, that the earth shall preserve enough of its ductility to be worked, moulded, and turned easily: and yet that its fatness shall be sufficiently taken from it, that it may not crack or shrink too much in drying or in baking. Vessels formed of this earth must be dried very gently to avoid cracking. They are then to be placed in a furnace to receive a slight baking, which is only meant to give them a certain consistence or hardness. And, lastly they are to be covered with an enamel or glazing; which is done, by putting upon the vessels thus prepared, the enamel, which has been ground very fine, and diluted with water. As vessels on which the enamel is applied are but slightly baked, they readily imbibe the water in which the enamel is suspended, and a layer of this enamel adheres to their surface: these vessels may then be painted with colours composed of metallic calces, mixed and ground with a fusible glass. When they are become perfectly dry, they are to be placed in the furnace, included in cases of baked earth called seggars, and exposed to a heat capable of fusing uniformly the enamel which covers them. This heat given to fuse the enamel being much stronger than that which was applied at first to give some consistence to the ware, is also the heat necessary to complete the baking of it. The furnace and the colours used for painting this ware, are the same as those employed for Porcelain. The glazing which is nothing but white enamel, ought to be so opaque as not to shew the ware under it. There are many receipts for making these enamels; but all of them are composed of sand or flints, vitrifying salts, oxide of lead, and oxide of tin; and the sand must be perfectly vitrified, so as to form a glass considerably fusible. Somewhat less than an equal part of alkaline salt, or twice its weight of oxide of lead, is requisite to effect such vitrifications of sand. The oxide of tin is not intended to be vitrified, but to give a white opaque colour to the mass; and one part of it is to be added to three or four parts of all the other ingredients taken together. From these general principles various enamels may be made to suit the different kinds of earthenware. To make the enamel, lead and tin are oxydized together with a strong fire; and the sand is also to be made into a frit with the salt or ashes. The whole is then to be well mixed and ground together. The matter is then to be placed under the furnace, where it is melted and vitrified during the baking of the ware. It is next to be ground in a mill, and

applied as above directed. Concerning the earth of which the ware is made, M. Bosc d'Antic observes, that pure clay is not a proper material when used alone. Different kinds of earth mixed together are found to succeed better. Pieces of ware made of clay alone, are found to require too much time to dry; and they crack, and lose their form, unless they are made exceedingly thick. An addition of marle diminishes the contraction of the clay; renders it less compact; and allows the water to escape, without altering the form of the ware in drying. It affords also a better ground for the enamel; which appears more glossy and white than when laid on clay alone. The kinds of clay which are chiefly used in the composition of delft ware, are the blue and green. A mixture of blue clay and marle would not be sufficiently solid, and would be apt to scale, unless it were exposed to a fire more intense than what is commonly used for the burning of delft ware. To give a greater solidity, some red clay is added; which on account of its ferruginous matter, possesses the requisite binding quality. The proportion of these ingredients vary in different works, according to the different qualities of the earths employed. Three parts of blue clay, two parts of red clay, and five parts of marle, form the composition used in several manufactories. M. d'Antic thinks, that the best delft ware might be made of equal parts of pure clay and pure calcareous earth; but this composition would require that the fire should be continued twice as long as it generally is.

DELFTHAVEN, a sea-port town of the late Batavian republic, in the department of Delft, 2 miles S. W. of Rotterdam.

DELHI, or **DELLI**, a province of Hindostan Proper, bounded on the N. W. by Lahore, on the N. E. by Serinagur, on the E. by the Rohila country on the S. by Agra, and on the W. by Moultan.

DELHI, the capital of the above province, is seated on the W. bank of the river Jumna, and is surrounded with brick walls 4 or 5 feet thick; it is the nominal capital, at present, of all Hindostan, and was the actual capital during the greatest part of the time since the Mohammedan conquest. It is 880 miles N. E. by N. of Bombay. Lon. 77. 40. E. Lat. 28. 37. N.

DELIA, in antiquity, a festival celebrated every 5th year in the island of Delos, in honour of Apollo. It was first instituted by Theseus, who at his return from Crete placed a statue there, which he had received from Ariadne.

DELIBAMENTA, in antiquity, a libation to the infernal gods, always offered by pouring downwards.

DELIBERANDI ANNUS, in the Scots law, a year allowed to an heir, to deliberate whether he will enter heir or not.

DELIBERATIVE, [*deliberativus*, Lat.] an appellation given to a branch of rhetoric, employed in proving a thing, or convincing an assembly thereof, in order to persuade them to put it in execution.

DELIBERATIVE VOICE, a right to give advice, and to vote in an assembly. In councils, the bishops have deliberative voices; those beneath them have only consultative voices.

DELICT, in Scots law, a small offence, or breach of the peace, punishable only by fine or short imprisonment.

DELIMA, in botany, a genus of the monogynia order, and polyandria class of plants. No corolla; calyx five-leaved, with a two-seeded berry. One species a native of Ceylon.

DELINQUENT, [from *delinquo*, Lat.] a guilty person, or one who has committed some fault, or offence, for which he is punishable.

DELIQUESCENT, in chemistry, the property which certain bodies have of attracting moisture from the air, and thereby becoming liquid. This property is never found but in saline substances, or matters containing them. It is caused by the great affinity which these substances have for water. The more simple they are, according to Mr. Macquer, the more they incline to deliquescence. Hence, acids, and certain alkalis, which are the most simple, are also the most deliquescent salts. Many neutral salts are deliquescent, chiefly those whose bases are not saline substances. See **CHEMISTRY**.

DELIQUUM, [from *deliquesco*, to be dissolved,] in chemistry, Salt of tartar, or any fixed alkali, set in a cellar or other moist place, and in an open vessel, resolves or runs into a kind of liquor called by the chemists oil of tartar per deliquium.

DELIQUUM, or **DELIQUUM ANIMI**, in medicine, [from *delinquo*,

quo, to swoon,] a swooning or fainting away; called also asphyxia, eclysis, lipopsychia, lipothymia, and syncope.

DELIRIUM, [Lat.] in medicine, the production of ideas not answerable to external causes, from an internal indisposition of the brain, attended with a wrong judgement following from those ideas, and an affection of the mind, and motion of the body, accordingly; and from these increased through various degrees, either alone or joined together, various kinds of deliria are produced.

DELIVERY. See **MIDWIFERY**.

DELMENHORST, a town of Germany, in the circle of Westphalia, and county of Oldenburgh, eight miles S. W. of Bremer.

DELOS, an island of the Archipelago, very famous in ancient history. Originally it is reported to have been a floating island, but afterwards it became fixed. It was fabled to have been the birth-place of Apollo and Diana. Anciently it was governed by its own kings. It is now called *Dii*.

DELOS, an extensive city in the above island, which occupied a spacious plain, reaching from the one coast to the other. It was well peopled, and the richest city in the Archipelago, especially after the destruction of Corinth; merchants flocking thither from all parts, both on account of the immunity they enjoyed, and of its convenient situation between Europe and Asia.

DELPHI, in ancient geography, a town of Phocis situated on the S. W. extremity of mount Parnassus. It was famous for a temple and oracle of Apollo, of which the following was said to be the origin: a number of goats that were feeding on mount Parnassus came near a place which had a deep and long perforation. The steam which issued from the hole seemed to inspire the goats, and they played and frisked about in such an uncommon manner, that the herd was tempted to lean on the hole, and see what mysteries the place contained. He was immediately seized with a fit of enthusiasm, his expressions were wild and extravagant, and passed for prophecies. This circumstance was soon known about the country, and many experienced the same enthusiastic inspiration. The place was revered; a temple was erected to Apollo; and a city built, which became the most illustrious in Phocis. The influence of its oracle controlled the councils of states, directed the course of armies, and decided the fate of kingdoms. The ancient history of Greece is full of its energy, and early register of its authority. The circumjacent cities were the stewards and guardians of the god. Their deputies composed the famous Amphictyonic assembly, which once guided Greece.

DELPHINIUM, **DOLPHIN FLOWER**, or **LARKSPUR**: a genus of the trigynia order, and polyandria class of plants; natural order, Multisiliquæ. No calyx; petals five; nectarium bifid, horned behind; siliquæ three or one. There are eleven species; hardy annuals or perennials. They are herbaceous plants of upright growth, rising from 18 inches to four feet in height, garnished with finely divided leaves, and terminated by long spikes of pentapetalous flowers of blue, red, white, or violet colours.

DELPHINIUS, an epithet of Apollo, so called, as it is pretended, because he assumed the form of a dolphin, to conduct Castalius and his colony from the isle of Crete to the Sinus Crisæus Delphinium, one of the courts of judicature of the Athenians.

DELPHINUS, the **DOLPHIN**, in astronomy. See **ASTRONOMY**.

DELPHINUS, the **DOLPHIN**, in zoology, a genus of the class mammalia, order cetæ. Teeth in each jaw; spiracle on the head. Shaw enumerates six species, and Gmelin four.

D. DELPHIS, the **TRUE DOLPHIN**. Historians and philosophers seem to have contended who should invent most fables concerning this fish. It was consecrated to the gods, was celebrated in the earliest time for its fondness of the human race, was honoured with the title of the sacred fish, and distinguished by those of boy-loving and philanthropist. It gave rise to a long train of inventions, proofs of the credulity and ignorance of the times. Aristotle steers the clearest of all the ancients from these fables, and gives in general a faithful history of this animal; but the elder Pliny, Ælian, and others, seem to preserve no bounds in their belief of the tales related of this fish's attachment to mankind. Scarce an accident could happen at sea, but the dolphin offered himself to convey to shore the unfortunate. Arion the musician, when flung into the ocean by the pirates, was received and saved by this benevolent fish. (Ovidii Fasti. Lib. ii. 113.) We are at a loss to account for the origin of those fables, since it does not ap-

pear that the dolphin shews a greater attachment to mankind, than the rest of the cetaceous tribe. We know, that at present the appearance of this fish and the porpessæ are far from being esteemed favourable omens by the seamen: for their boundings, springs, and frolics, in the water, are held to be sure signs of an approaching gale. It is during their leaps out of that element, that they assume a temporary form that is not natural to them; but which the ancient painters and sculptors have almost always given them. A dolphin is scarce exhibited by the ancients in a straight shape, but almost always incurvated: such are those on the coin of Alexander the Great, preserved by Belon, as well as on several other pieces of antiquity. The poets describe them much in the same manner, and it is not improbable but that the one had borrowed from the other. (See Senec. Trag. Agam. 430.) The natural shape of the dolphin is almost straight, the back being very slightly incurvated, and the body slender: the nose is long, narrow, and pointed, not much unlike the beak of some birds, for which reason the French call it *Poye de mer*. See Plate LV. It has in all forty teeth; twenty-one in the upper jaw and nineteen in the lower; a little above an inch long, conic at their upper end, sharp-pointed, bending a little in. They are placed at small distances from each other; so that when the mouth is shut, the teeth of both jaws lock into one another. It was formerly reckoned a great delicacy: Dr. Caius says, that one, which was taken in his time, was thought a present worthy the duke of Norfolk, who distributed part of it among his friends.

D. PHOCENA, or the **PORPESSE**, is the most abundant of cetaceous animals, and is found particularly in the European seas, whence it often advances very nearly to the mouths of considerable rivers. Its general length is from five to eight feet. Porpesses are gregarious, and are frequently seen frolicking on the water, and playing their uncouth gambols, more especially in boisterous and tempestuous weather. They feed principally on smaller fishes, and pursue the shoals of herrings and mackerel with apparently unwearied vigour and insatiable appetite. They are covered immediately under the skin with a fatty substance of considerable thickness, and which produces a large quantity of oil. The porpessæ were formerly considered, not merely as eatable, but as a species of luxury, being served up at noble and royal tables. Such, however, are the revolutions of taste, that by the least fastidious appetite this food is at present decidedly rejected.

D. ORCA, the **GRAMPUS**, is found from the length of fifteen feet to that of twenty-five. It is remarkably thick in proportion to its length, one of eighteen feet being in the thickest place ten feet diameter. With reason then did Pliny call this "an immense heap of flesh armed with dreadful teeth." It is extremely voracious; and will not even spare the porpessæ, a congenerous fish. It is said to be a great enemy to the whale, and that it will fasten on it like a dog on a bull, till the animal roars with pain. The nose is flat and turns up at the end. There are 30 teeth in each jaw: those before are blunt, round, and slender: the farthest sharp and thick; between each is a space adapted to receive the teeth of the opposite jaw when the mouth is closed. The spout hole is in the top of the neck. The colour of the back is black, but on each shoulder is a large white spot; the sides marbled with black and white; the belly of a snowy whiteness. These fishes sometimes appear on our coasts; but are found in much greater numbers off the N. Cape in Norway, whence they are called the North-Capers.

DELPHOS, a town, or rather village, of Turkey in Asia, in the province of Libadia: occupying part of the site of the ancient Delphi.

DELSPERG, a town of Switzerland, in the bishopric of Basle, 10 miles N. W. of Soleure.

DELTA, a part of Lower Egypt, which takes up a considerable space of ground between the branches of the Nile and the Mediterranean Sea: the ancients called it the Delta, because it is in the form of a triangle, like the Greek Δ. The principal towns on the coast are Damietta, Rosetta, and Alexandria; but, within land, Menousia, and Maaku or Elmalâ.

DELTOIDE, [from *delta*, *delta*, the fourth letter of the Greek alphabet, and Δ, likeness; so called by reason of its resembling this letter,] an epithet applied to a triangular muscle arising from the clavicula, and from the process of the same, whose action is to raise the arm upward. See **ANATOMY**.

DELUGE, [*diluvium*, Lat.] an inundation, or overflowing of the earth, either wholly, or in part, by water. We have several deluges recorded in history, as that of Ogyges, which overflowed almost all Attica, and that of Deucalion, which drowned all Thessaly, in Greece: but the most memorable was that called the universal deluge, or Noah's flood, which overflowed and destroyed the whole earth, and out of which only Noah, and those with him in the ark, escaped. This flood makes one of the most considerable epochs in chronology. Its history is given by Moses, Gen. chap. vi. and vii. Its time is fixed by the best chronologers, to the year from the creation, 1656, answering to the year before Christ, 2348. From this flood, the state of the world is divided into diluvian and antediluvian. Among the many testimonies of the truth of this part of the Mosaic history, we may account the general voice of mankind at all times, and in all parts of the world. The objections of the free-thinkers have indeed principally turned upon three points, viz. 1. The want of any direct history of that event by the profane writers of antiquity: 2. the apparent impossibility of accounting for the quantity of water necessary to overflow the whole earth to such a depth as it is said to have been: and 3. there appearing no necessity for an universal deluge, as the same end might have been accomplished by a partial one. The first of these objections has given rise to several very elaborate treatises. Mr. Bryant, in his *System of Mythology*, has with great learning and considerable success endeavoured to shew, that the deluge was one of the principal, if not the only foundation, of the Gentile worship; that the first of all their deities was Noah; that all nations of the world look up to him as their founder: and that he, his sons, and the first patriarchs, are alluded to, in most if not all of the religious ceremonies, not only of the ancient but of the modern heathens. In short, he observes that the deluge, so far from being forgot, or obscurely mentioned by the heathen world, is in reality conspicuous throughout every one of their acts of religious worship. The Egyptian Osiris (he says) was the same with Ham the son of Noah; though the name was sometimes bestowed on Noah himself. Osiris, according to Diodorus Siculus, was wonderfully preserved in an ark, and taught the use of the vine; to build, plant, &c. He proceeds to shew from the hieroglyphics, fables, and ceremonies, which are found in the heathen mythology, and history, as well as from the names which were applied to the objects and places of their worship, as gods, heroes, temples &c. that an indubitable account of an universal deluge and the principal circumstances of it, as mentioned in the sacred scriptures, is preserved in every part of the pagan world. 2. The fact being thus established by the universal consent of mankind, that there was a general deluge which overflowed the whole world; it is worthy of inquiry, by what means it may be supposed to have been accomplished. The chief hypotheses are the following:—1. It has been asserted, that a quantity of water was created on purpose, and at a proper time annihilated, by divine power. This, however, besides its being absolutely without evidence, is directly contrary to the words of the sacred writer, whom the asserters of this hypothesis mean to defend. He expressly derives the waters of the flood from two sources; first, the fountains of the great deep, which he tells us were all broken up; and secondly, the windows of heaven, which he says were opened: and speaking of the decrease of the waters, he says, the fountains of the deep and the windows of heaven were stopped, and the waters returned continually from off the earth. It is obvious, that Moses was so far from having any difficulty about the quantity of water, that he thought the sources from whence it came were not exhausted; since both of them required to be stopped by the same almighty hand who opened them. 2. Dr. Burnet, in his "*Telluris Theoria Sacra*," endeavours to shew, that all the waters in the ocean are not sufficient to cover the earth to the depth assigned by Moses. Supposing the sea drained quite dry, and all the clouds of the atmosphere dissolved into rain, we should still want the greatest part of the water of a deluge. According to the Dr. no less than eight oceans would have been requisite. To get clear of this difficulty, he and others have adopted Descartes's theory. That philosopher will have the antediluvian world to have been perfectly round and equal, without mountains or valleys. He accounts for its formation on mechanical principles, by supposing it at first in the condition of a thick turbid fluid replete with divers heterogeneous matters; which, subsiding by slow degrees, formed themselves into different concentric strata, or beds, by the laws of gravity. Dr. Burnet improves

on this theory, by supposing the primitive earth to have been no more than a crust investing the water contained in the ocean, and in the central abyss, which he and others suppose to exist in the bowels of the earth. At the time of the flood, this outward crust broke in a thousand places; and sunk down among the water, which thus spouted up in vast cataracts, and overflowed the whole surface. He supposes also, that before the flood there was a perfect coincidence of the equator with the ecliptic, and consequently that the antediluvian world enjoyed a perpetual spring; but that the violence of the shock, by which the outer crust was broken, shifted also the position of the earth, and produced the present obliquity of the ecliptic. This theory is not only equally arbitrary with the former, but directly contrary to the words of Moses, who assures us, that all the high hills were covered; while Dr. Burnet affirms that there were no hills then in being. 3. Other authors, supposing a sufficient fund of water in the sea or abyss, are only concerned for an expedient to bring it forth. Accordingly Mr. Ray has recourse to a shifting of the earth's centre of gravity, which, drawing after it the water out of its channel, overwhelmed the several parts of the earth successively. But this could only occasion a partial deluge in that part of the globe, towards which the centre of gravity was translated: nor can the possibility of such a translation be allowed, since the centre of gravity is the necessary result of the materials composing our globe, and not alterable whilst the parts remained in the same position. 4. Dr. Hook's opinion of the compression of a shell of earth into a prolate spheroid, thereby pressing out the water of the abyss under the earth, may very well account for the waters overflowing two opposite zones of the globe; but the middle zone being by much the greater part of the earth's surface, must thus have been raised higher from the centre, and consequently more out of the water than before. 5. Dr. Halley ascribes the deluge to the shock of a comet, whereby the polar and diurnal rotation of the globe would be instantly changed. The great agitation that must have been occasioned by it in the sea, he observes, would be sufficient to account for all those strange appearances of heaping vast quantities of earth and high cliffs upon beds of shells, which were once the bottom of the sea, and raising up mountains where none were before. Such a shock as this, impelling the solid parts, would occasion the waters, and all fluid substances that were unconfined, as the sea is, to run violently towards that part of the globe where the blow was received, and that with force sufficient to take with it the very bottom of the ocean, and remove it to the land. It is objected to this system, that such a shock must have brought on the deluge instantaneously, and not gradually, as it is expressly said to have happened. Phil. Trans. No. 383, p. 120. 6. The inquisitive Mr. Whiston, in his "*New Theory of the Earth*," has a very ingenious hypothesis, similar to that of Dr. Halley, but more fully explained. He shews from several remarkable coincidences, that a comet descending in the plane of the ecliptic, towards its perihelion, passed just before the earth on the first day of the deluge; the consequences whereof would be, first, that this comet, when it came below the moon, would raise a vast and strong tide, both in the small seas, which, according to his hypothesis, were in the antediluvian earth, (for he allows no great ocean there as in ours,) and also in the abyss which was under the upper crust of the earth; and this tide would rise and increase all the time of the approach of the comet towards the earth; and would be at its greatest height when the comet was at its least distance from it. By the force of this tide, as well as by the attraction of the comet, he judges, that the abyss must put on an elliptical figure, whose surface being considerably larger than the former spherical one, the outward crust of the earth, incumbent on the abyss, must accommodate itself to that figure, which it could not do while it held solid, and conjoined together. He concludes, therefore, that it must of necessity be extended, and at last broke by the violence of the said tides and attraction; out of which the included water issuing, was a great means of the deluge: this answering to what Moses speaks of the "fountains of the great deep being broke open."—Again, the same comet, he shews, in its descent towards the sun, passed so close by the body of the earth, as to involve it in its atmosphere and tail for a considerable time; and of consequence left a vast quantity of its vapours, both expanded and condensed, on its surface; a great part of which being rarefied by the solar heat, would be drawn up into the atmosphere, and afterwards return in violent rains; and this he takes to be what Moses intimates by "the windows of heaven being

being opened," and particularly by the "forty days rain." For as to the following rain, which with this made the whole time of raining 150 days, Mr. Whiston attributes it to the earth coming a second time within the atmosphere of the comet as the comet was on its return from the sun. 7. Dr. Woodward, taking the several strata found in the earth for the relicts of a deluge, and considering the circumstances of those fishes, shells, and other exuviae, found in them, draws several inferences, which seem to illustrate the effects of the deluge. These marine bodies, and other spoils of salt-water fish, were carried out of the sea by the universal deluge; and on the return of the water, were left behind upon the land, &c. See Nat. Hist. of the Earth, p. 1 and 2. 8. According to M. De La Pryme, the antediluvian world had an external sea as well as land, with mountains, rivers, &c. and the deluge was effected by breaking the subterraneous caverns, and pillars thereof, with dreadful earthquakes, and causing the same to be for the most part, if not wholly, absorbed, swallowed up, and covered by the seas that we now have. This earth of ours arose (he says) out of the bottom of the antediluvian sea; and in its room, just as many islands are swallowed down, and others thrust up in their stead. 9. Mr. King has lately adopted an hypothesis resembling this last. He ascribes the deluge to subterraneous fires within the bowels of the earth, which burst forth with great violence under the sea, and raised up the bottom of the ocean, so as to pour out the waters over the face of what was before dry land, which thus became the sea, and has since continued, and that which was before the bottom of the sea became dry land. An earthquake thus occasioned will account, he supposes, for the access of the deluge and the confused disposition of marine productions in the post-diluvian earth. Phil. Trans. vol. lvii. p. 44, &c. These three last hypotheses appear to be pretty plausible, because they seem to account for the well-known phenomena of shell-fish, shells, and various other marine productions, as well as trees and the bones and horns of numberless quadrupeds, &c. being found deeply buried in the earth among various strata, and in the heart or mountains far distant from the sea, or the places where the plants and animals are originally and usually produced. But on these, as on all the other hypotheses, it may be remarked, that they are quite arbitrary, and without the least foundation from the words of Moses. The sacred historian speaks not one word of earthquakes, comets, or subterraneous fires; nay, from the nature of the thing, we know it is impossible that the flood could have been occasioned by an earthquake, and the ark preserved, without a miracle, which is not to be supposed, when we endeavour to account for events upon natural principles. It is certain, that if a ship sinks at sea, the commotion excited in the water by the descent of such a large body, will swallow up a small boat that happens to come too near. If the pillars of the earth itself then were broken, what must the commotion have been, when the continents of Europe, Asia, and Africa, descended into the abyss at once? not to mention America, which lying at so great a distance from Noah, he might be supposed out of danger from that quarter. By what miracle was the ark preserved amidst the tumult of those impetuous waves which must have rushed in from all quarters? Besides, as the ark was built not at sea, but on dry ground; when the earth on which it rested sunk down, the ark must have sunk along with it; and the waters falling in as it were overhead, must have dashed in pieces the strongest vessel that can be imagined. Earthquakes, also, operate suddenly and violently; whereas, according to the Mosaic account, the flood came on gradually, and did not arrive at its height till six weeks, or perhaps five months, after it began. 10. Mr. Hutchinson and his followers present us with a theory of the deluge, which they pretend to derive from the word of God itself. This theory has been illustrated by Mr. Catcot, who, in 1768, published a volume on the subject. He asserts, that when the world was first created, at the time when it is said to have been "without form and void," the terrestrial matter was then entirely dissolved in the aqueous; so that the whole formed, as it were, a thick muddy water. The figure of this mass was spherical; and on the outside of this sphere lay the gross dark air. Within the sphere of the earth and water was an immense cavity, called by Moses the deep; and this internal cavity was filled with air of a kind similar to that on the outside. On the creation of light, the internal air received elasticity sufficient to burst out through the external covering of earth and water. Upon this the water descended, filled up the void, and left the earth in a form

similar to what it hath at present. Thus, according to him, the antediluvian world, as well as the present, consisted of a vast collection of water, called the great deep, or the abyss; and over this the shell of earth perforated in many places; by which means the waters of the ocean communicated with the abyss. The breaking up of these fountains was occasioned by a miraculous pressure of the atmosphere, from the immediate action of the Deity himself. So violent was this pressure, that the air descended to where it had been originally; occupied the space of the abyss; and drove out the waters over the whole face of the dry land. But this account, so far from being infallibly certain, seems inconsistent with the most common observations. No pressure, however violent, will cause water to rise above its level, unless that pressure is unequal. If, therefore, the atmosphere entered into the supposed abyss, by a vehement pressure on the surface of the ocean, that pressure must only have been on one place, or on a few places: and even though we suppose the atmosphere to have been the agent made use of, it is impossible that it could have remained for any time in the abyss without a continued miracle; as the pressure of the water would immediately have forced it up again through those holes which had afforded it a passage downwards. The explanation given from Hutchinson by Mr. Catcot, of the "windows of heaven," is somewhat extraordinary. According to him, these windows are not in heaven, but in the bowels of the earth; and mean no more than the cracks and fissures by which the airs found a passage through the shell or covering of earth, which they utterly dissolved and reduced to its original state of fluidity. It is, however, difficult to conceive how the opening of such windows as these could cause a violent rain for 40 days and nights. These several theories are all of them very far from being satisfactory, and some of them are quite contradictory: however, they serve to shew the weakness of our reason and the limited state of our knowledge, for though we cannot find out one way naturally to account for the deluge, yet we are well satisfied that God could find a thousand ways to effect this purpose. The following theory, inserted under the article DELUGE, in the Encyclopædia Britannica, is more agreeable both to Scripture, and to the latest discoveries in natural philosophy, than any of those above-mentioned. 1. "If we consider the quantity of water requisite for the purpose of the deluge, it will not appear so very extraordinary as has been commonly represented. The height of the highest hills is thought not to be quite four miles. It will therefore be deemed a sufficient allowance, when we suppose the waters of the deluge to have been four miles deep on the surface of the ground. Now it is certain, that water, or any other matter, when spread out at large upon the ground, seems to occupy an immense space in comparison of what it does when contained in a cubical vessel, or when packed together in a cubical form. Suppose we wanted to overflow a room 16 feet every way, or containing 256 square feet, with water, to the height of one foot, it may be nearly done by a cubical vessel of six feet filled with water. A cube of eight feet will cover it two feet deep, and a cube of ten feet will very nearly cover it four feet deep. It makes not the least difference whether we suppose feet or miles to be covered. A cube of ten miles of water would very nearly overflow 256 square miles of plain ground to the height of four miles. But if we take into our account the vast number of eminences with which the surface of the earth abounds, the above-mentioned quantity of water would do a great deal more. If, therefore, we attempt to calculate the quantity of water sufficient to deluge the earth, we must make a very considerable allowance for the bulk of all the hills on its surface. To consider this matter, however, in its utmost latitude: the surface of the earth is supposed, by the latest computations, to contain 199,512,595 square miles. To overflow this surface to the height of four miles, is required a parallelopiped of water 16 miles deep, and containing 49,878,148 square miles of surface. Now, considering the immense thickness of the globe of the earth, it can by no means be improbable, that this whole quantity of water may be contained in its bowels, without the necessity of any remarkable abyss or huge collection of water, such as most of our theorists suppose to exist in the centre. It is certain, that as far as the earth has been dug, it hath been found not dry, but moist; nor have we the least reason to imagine, that it is not at least equally moist all the way down to the centre. How moist it really is cannot be known, nor the quantity of water requisite to impart to it the degree of moisture it has; but we are sure it must be immense.

mense. The earth is computed to be near 8000 miles in diameter. The ocean is of an unfathomable depth; but there is no reason for supposing it more than a few miles. To make all reasonable allowances, however, we shall suppose the whole solid matter in the globe to be only equal to a cube of 5000 miles; and even on this supposition we shall find, that all the waters of the deluge would not be half sufficient to moisten it. The above-mentioned parallelopiped of water would indeed contain 798,050,368 cubic miles of that fluid; but the cube of earth containing no less than 125,000 millions of cubic miles, it is evident that the quantity assigned for the deluge would scarce be known to moisten it. It could have indeed no more effect this way, than a single pound of water could have upon 150 times its bulk of dry earth. We are persuaded therefore, that any person who will try by experiment how much water a given quantity of earth contains, and from that experiment will make calculations with regard to the whole quantity of water contained in the bowels of the earth, must be abundantly satisfied, that though all the water of the deluge had been thence derived, the diminution of the general store would, comparatively speaking, have been next to nothing.

2. It was not from the bowels of the earth only that the waters were discharged, but also from the air; for we are assured by Moses, that it rained 40 days and 40 nights. This source of the diluvian waters hath been considered as of small consequence by almost every one who hath treated on the subject. The general opinion concerning this matter we shall transcribe from the "Universal History," Vol. I. where it is very fully expressed. "According to the observations made of the quantity of water that falls in rain, the rains could not afford one ocean, nor half an ocean, and would be a very inconsiderable part of what was necessary for a deluge. If it rained 40 days and 40 nights throughout the whole earth at once, it might be sufficient to lay all the lower grounds under water, but it would signify very little as to the overflowing of the mountains; so that it has been said, that if the deluge had been made by rains only, there would have needed not 40 days, but 40 years, to have brought it to pass. And if we suppose the whole atmosphere condensed into water, it would not all have been sufficient for this effect; for it is certain, that it could not have risen above 32 feet, the height to which water can be raised by the pressure of the atmosphere: for the weight of the whole air, when condensed into water, can be no more than equal to its weight in its natural state, and must become no less than 800 times denser; for that is the difference between the weight of the heaviest air and that of water." On this subject we must observe, that there is a very general mistake with regard to the air, similar to the above-mentioned one regarding the earth. Because the earth below our feet appears to our senses firm and compact, therefore the vast quantity of water, contained even in the most solid parts of it, and which will readily appear on proper experiment, is overlooked, and treated as a non-entity. In like manner, because the air does not always deluge with excessive rains, it is also imagined that it contains but very little water. Because the pressure of the air is able to raise only 32 feet of water on the surface of the earth, it is therefore supposed we may know to what depth the atmosphere could deluge the earth, if it was to let fall the whole water contained in it. But daily observations shew, that the pressure of the atmosphere has not the least connection with the quantity of water it contains. Nay, if there is any connection, the air seems to be lightest when it contains most water. In the course of a long summer's drought, for instance, the mercury in the barometer will stand at 30 inches, or little more. If it does so at the beginning of the drought, it ought to ascend continually during the time the dry weather continues; because the air is all the while absorbing water in great quantity from the surface of the earth and sea. This, however, is known to be contrary to fact. At such times the mercury does not ascend, but remains stationary; and what is still more extraordinary, when the drought is about to have an end, the air, while it yet contains the whole quantity of water it absorbed, and has not discharged one single drop, becomes suddenly lighter, and the mercury will perhaps sink an inch before any rain falls. The most surprising phenomenon, however, is yet to come. After the atmosphere has been discharging for a number of days successively a quantity of matter 800 times heavier than itself, instead of being lightened by the discharge, it becomes heavier, nay specifically heavier than it was before. It is also certain, that very dry air, provided it is not at the same time very hot, is always

heaviest; and the driest air which we are acquainted with, namely Dr. Priestley's dephlogisticated air, is considerably heavier than the air we commonly breathe. For these reasons we think the quantity of water contained in the whole atmosphere ought to be considered as indefinite, especially as we know that by whatever agent it is suspended, that agent must counteract the force of gravity, otherwise the water would immediately descend; and while the force of gravity in any substance is counteracted, that substance cannot appear to us to gravitate at all. 3. The above considerations render it probable at least, that there is in nature a quantity of water sufficient to deluge the world, provided it was applied to the purpose. We must next consider whether there is any natural agent powerful enough to effect this purpose. We shall take the phrases used by Moses in their most obvious sense. The breaking up of the fountains of the deep we may reasonably suppose to have been the opening of all the passages, whether small or great, through which the subterraneous waters possibly could discharge themselves on the surface of the earth. The opening of the windows of heaven we may also suppose to be the pouring out of the water contained in the atmosphere through those invisible passages by which it enters in such a manner as totally to elude every one of our senses, as when water is absorbed by the air in evaporation. As both these are said to have been opened at the same time, it seems from thence probable, that one natural agent was employed to do both. Now it is certain, that the industry of modern inquirers has discovered an agent unknown to the former ages, and whose influence is so great, that with regard to this world it may be said to have a kind of omnipotence. The agent we mean is electricity. It is certain, that, by means of it, immense quantities of water can be raised to a great height in the air. This is proved by the phenomena of water-spouts. Mr. Forster relates, that he happened to see one break very near him, and observed a flash of lightning proceed from it at the moment of its breaking. The conclusion from this is obvious. When the electric matter was discharged from the water, it could no longer be supported by the atmosphere, but immediately fell down. Though water-spouts do not often appear in this country, yet every one must have made an observation somewhat similar to Mr. Forster's. In a violent storm of thunder and rain, after every flash of lightning, or discharge of electricity from the clouds, the rain pours down with increased violence; thus shewing that the cloud, having parted with so much of its electricity, cannot longer be supported in the form of vapour, but must descend in rain. It is not indeed yet discovered that electricity is the cause of the suspension of water in the atmosphere; but it is certain that evaporation is promoted by electrifying the fluid to be evaporated. (See ELECTRICITY and EVAPORATION.) It may therefore be admitted as a possibility, that the electric fluid contained in the air is the agent by which it is enabled to suspend the water which rises in vapour. If, therefore, the air is deprived of the due proportion of this fluid, it is evident that rain must fall in prodigious quantities. Again we are assured, from the most undeniable observations, that electricity is able to swell up water on the surface of the earth. This we can make it do even in our trifling experiments; and much more must the whole force of the fluid be supposed capable of doing it, if applied to the waters of the ocean, or any others. The agitation of the sea in earthquakes is a sufficient proof of this. (See EARTHQUAKE.) It is certain, that at these times there is a discharge of a vast quantity of electric matter from the earth into the air; and as soon as this happens, all becomes quiet on the surface of the earth. From a multitude of observations it also appears, that there is at all times a passage of electric matter from the atmosphere into the earth, and vice versa from the earth into the atmosphere. There is therefore no absurdity in supposing the Deity to have influenced the action of the natural powers, in such a manner, that for 40 days and nights the electric matter contained in the atmosphere, should descend into the bowels of the earth; if indeed there is occasion for supposing any such immediate influence at all, since it is not impossible that there might have been, from some natural cause, a descent of this matter from the atmosphere for that time. But by whatever cause the descent was occasioned, the consequence would be, the breaking up of the fountains of the deep, and the opening the windows of heaven. The water contained in the atmosphere being left without support, would descend in impetuous rains; while the waters of the ocean, those from which fountains originate, and those contained in the solid earth itself, would rise from

from the very centre, and meet the waters which descended from above. Thus the breaking up of the fountains of the deep, and the opening of the windows of heaven, would accompany each other, as Moses tells us they actually did; for, according to him, both happened on the same day. In this manner the flood would come on quietly and gradually, without that violence to the globe which Burnet, Whiston, and other theorists, are obliged to suppose. The abatement of the waters would ensue on the ascent of the electric fluid to where it was before. The atmosphere would then absorb the water as formerly; that which had ascended through the earth would again subside; and thus every thing would return to its pristine state." 3. The proof of the universal deluge is so strong from the traditions prevalent among almost all nations on the face of the earth, that no farther objection could be made to the Mosaic account, were it not that the necessity of an universal deluge is denied by some, who contend that all the deluges mentioned in history, or recorded by tradition, were only partial, and may be accounted for from the swelling of rivers, or other accidental causes. Many indeed, even of those who profess to believe the Mosaic account, have thought that the deluge was not universal; or, that though it might be universal with respect to mankind, it was not so with regard to the earth itself. The learned Isaac Vossius was of this opinion, though his reasons seem principally to have been, that he could not conceive how an universal deluge could happen. Bishop Stillingfleet adopted the same opinion, from a persuasion that the earth was by no means fully peopled, and therefore there was no necessity for the deluge being universal. And Mr. Coetlogon, in his *Universal History of Arts and Sciences*, has adopted the same idea, to accommodate the belief of a deluge to the opinions of freethinkers. All the arguments that have been advanced by these ingenious authors, in support of a partial deluge, may be summed up in the three following articles: 1. The impossibility, in a natural way, of accounting for the quantity of water necessary to overflow the whole world; 2. The small number of mankind supposed at that time to have existed on the earth; and, 3. The inutility of an universal deluge; when the divine purposes could have been equally well answered by a partial one. But to all this we may make one general answer, that a partial deluge, sufficiently great to have overwhelmed the whole human race, though the globe had not been half-peopled, is in the nature of things impossible. We cannot imagine that the waters could accumulate upon any country without going off to the sea, while the latter retained its usual level; neither can we suppose any part of the sea to remain above the level of the rest. On the supposition of Bishop Stillingfleet, therefore, that the deluge extended over the whole continent of Asia, we know that it must have covered the high mountains of Ararat, on which the ark rested; Caucasus, Taurus, &c. The height of Ararat is indetermined, as no traveller of any credit pretends to have ascended to its top; but from the distance at which it is seen, we can scarce look upon it to be inferior to the most celebrated mountains of the old continent. Sir John Chardin thinks that some part of Caucasus is higher; and supposing each of these to be only a mile and an half in height, the sea all round the globe must have been raised to the same height; and therefore all that could remain of dry ground, as a shelter to animals of any kind, must have been the uninhabitable tops of some high mountains scattered at immense distances from one another. We may, therefore, with equal reason suppose, that these were in like manner covered, and that no living creature whatever could find shelter for a moment; and it is certainly more agreeable for the character of the Deity to believe, that he would at once destroy animal life by suffocation in water, rather than allow numbers of them to collect themselves on the tops of mountains, to perish with hunger and cold. It is besides very improbable, that any creature, whether bird or beast, could sustain a continued rain of 40 days and 40 nights, even without supposing them to have been absolutely immersed in water. This consideration alone is sufficient to shew, that the deluge must have been universal with regard to the world as well as the human race. At the time of the deluge, according to the most moderate computations, the world must have been vastly more full of people than at present. The lowest calculation indeed seems incredible; since, according to it, the world must have contained upwards of 68,719 times as many inhabitants as are at present to be met with in the empire of China, the most populous country in the world: but China bears a much larger proportion to the habit-

able part of the world than this. The violences exercised by mankind upon one another, have always been the chief means of thinning their numbers, and preventing the earth from being overstocked with inhabitants; and the strong expression in Scripture, that the "earth was filled with violence," shews that it must have gone to an extraordinary height. But though this violence must have undoubtedly thinned the old world of its inhabitants, it must likewise have dispersed some of them into distant regions. There is therefore no reason for supposing, that before the flood the human race were not driven into the remotest regions of the habitable world, or that America was destitute of inhabitants then, more than it is at present. At any rate, the schemes of Vossius and Coetlogon, who would confine the whole race of mankind to a small part of Asia, must appear highly erroneous. Objections have been made to the doctrine of an universal deluge from the state of the continent of America, and the number of animals peculiar to that and other countries, which could not be supposed to travel to such a distance either to, or from the ark. On this subject bishop Stillingfleet observes, that the supposition of animals being propagated much farther in the world than mankind before the flood, seems very probable, "because the production of animals is parallel in Genesis with that of fishes, and both of them different from man. (See Gen. i. 20-25.) From hence I observe this difference between the formation of animals and of man, that in one, God gave a prolific power to the earth and waters for the production of the several living creatures which came from them, so that the seminal principles of them were contained in the matter out of which they were produced, which was otherwise in man, who was made by a peculiar hand of the great Creator himself, who thence is said to have formed man out of the dust of the ground. If now this supposition be embraced, by it we presently clear ourselves of many difficulties concerning the propagation of animals in the world, and their conservation in the ark. Besides, some kind of animals cannot live out of the climate wherein they are; and there are many sorts of animals discovered in America and the adjoining islands, which have left no remainders of themselves in these parts of the world. And it seems very strange, that these should emigrate into those parts of the world from the place of the flood, and leave none at all of their number behind them in these parts whence they were propagated." To this Mr. Cockburn, in his treatise on the deluge, replies, 1. That as it pleased God to create only one man and one woman at the beginning, and their posterity were sufficient to overspread the earth, it might well be supposed to be furnished with animals from an original pair of each. 2. On the supposition of many pairs of brute animals having been created originally, they must, when the human race were few in number, have multiplied to such a degree as to render the world uninhabitable. We have good reason therefore to conclude, that there was but one pair of animals created at first, that they might not increase too fast for mankind; and though they would multiply much more, and increase faster than men could do, they had room to spread themselves for a long time without much annoyance to man; and as men increased in number and extended their habitations, they would be able to drive them further off, or defend themselves from their depredations." 3. Though at the restoration of the world it was to be re-peopled by six persons instead of two, and though at the same time animal food was given to man, yet Noah was commanded only to take a single pair of each of the animals, clean beasts, which are but few in number, only excepted. It is further observable, that notwithstanding this scanty supply of animals, they had increased so much by the time of Nimrod, that it then became necessary to hunt and destroy them; and Nimrod was celebrated for his courage and skill in that necessary employment. 4. Mr. Cockburn is of opinion, that America must have been peopled before the flood, as the old continent could not be supposed able to hold the number of inhabitants. 5. With regard to the main difficulty, viz. how the animals peculiar to different countries could travel to such distances to and from the ark, he replies, that America has nothing peculiar to it, but what may equally well be urged both with respect to Asia and Africa; each of them having animals peculiar to themselves. It is also possible, that there might formerly be a more easy communication between the Asiatic and American continents than there is now. He likewise observes, that though the ark rested on mount Ararat, yet we are not told where it was built, which might be far enough from the place commonly supposed.

posed. But in whatever part of the earth the ark was built, it was at God's command that the several kinds of animals came thither in order to their preservation; and his power could bring them from the farthest parts of the earth, during the 120 years that the world lay under condemnation. Though after all, none of the animals might have very far to travel to the ark; for if only one pair of each kind was created at first, and all of these in or near one place, since they were all brought before Adam, and received names from him, there is no absurdity in supposing, that some of every kind might remain in the country where they were first produced, from whence Noah's habitation might not be very distant. Neither can any objection be brought from the extinction of some species of animals in certain countries of the world, since they might have been hunted and destroyed either by the human race, or by other creatures. Among other questions which have been started on this subject, one is, by what means were the ravenous animals, which feed only upon flesh, supported in the ark? For this some authors have supposed, that Noah, besides those animals whom he took into the ark for preservation, took likewise a great number for slaughter. Bishop Wilkins has allowed no fewer than 1825 sheep, though he was of opinion, that there were no carnivorous animals before the flood; and this latter opinion is adopted by Mr. Cockburn. The idea indeed of slaughtering a number of harmless animals to satisfy a few vile rapacious ones, and that too in a place designed for the common asylum of the animal creation, seems inconsistent with that scheme of mercy displayed in the whole transaction. It is by much the more probable supposition, then, that though some animals had been accustomed to live on flesh in their natural state, they could nevertheless subsist upon vegetable food. This seems the more probable, as some animals naturally carnivorous, particularly dogs and cats, may be supported in their domestic state by vegetable food alone. If we extend this to the whole canine and feline genera, we shall take in the most of the beasts of prey; as lions, tigers, leopards, panthers, wolves, foxes, hyænas, &c. Bears are well known sometimes to feed on berries; snakes will eat bread and milk; and there is no reason to suppose, that even the most carnivorous birds could not be kept alive by gram or other vegetable food. By thus excluding such a number of useless animals, a very considerable space will be allowed for the circulation of air in the ark, the want of which seems to be the most inexplicable difficulty, if we may judge from the present constitution of things. See **ARK**.

DEMAIN, DEMEAN, DEMESNE, [*domaine*, Fr.] 1. That land which a man holds originally of himself, called *dominium* by the civilians, and opposed to *feodum*, or fee, which signifies those that are held of a superior lord. It is sometimes used also for a distinction, between those lands that the lord of the manor has in his own hands, or in the hands of his lessee, demised or let upon a rent for a term of years or life, and such other lands appertaining to the said manor as belong to free or copyholders. 2. Estate in land.

DEMAND, calling upon a man for any sum or sums of money, or any other thing due. By the several statutes of limitation, debts, claims, &c. are to be demanded and made in time, or they will be lost by law. There are two manner of demands, the one in deed, the other in law; in deed, as in every precept there is an express demand; in law, as in every entry in land, distress for rent, taking or seizing of goods, and such like acts, which may be done without any words, are demands in law. Where there is a duty which the law makes payable on demand, no demand need be made; but if there be no duty but demand, in such case there must be a demand to make the duty.

DEMERARA, a district of South America, in Dutch Guiana, which forms one government with Issequibo.

DEMERARA, DEMERARY, or DEMERARI, a river in the above district, about 2 miles wide at its mouth, opposite the fort, on the E. bank of the river.

DEMESNE. See **DEMAIN**.

DEMESNE LANDS. See **REVENUE**.

DEMETÆ, an ancient people of Britain, supposed to be a branch of the Silures, who occupied that inner corner formed by the Bristol Channel and the Frish Sea.

DEMETER, or DEMETRA, [*Δημήτηρ*, Gr.] the name given by the Greeks to Ceres.

DEMETRIA, a festival in honour of Ceres. It was then cus-

tomary for the votaries of the goddess to lash themselves with whips made of the bark of trees.

DEMETRIOWITZ, a city of Russia, in the duchy of Smolensko. Lon. 37. 0. E. Lat. 53. 20. N.

DEMETRIUS I. surnamed **POLIORCETES**, *i. e.* a taker of towns, was the son of Antigonus, king of Asia, by Stratonice. At the age of twenty-two, he was sent by his father against Ptolemy, who invaded Syria. He was defeated near Gaza; but he soon repaired his loss by a victory over one of the generals of the enemy. He afterwards sailed with a fleet of 250 ships to Athens, and restored the Athenians to liberty, by freeing them from the power of Cassander and Ptolemy, and expelling the garrison, which was stationed there under Demetrius Phalereus. After this successful expedition, he besieged and took Munychia, and defeated Cassander at Thermopylae. His reception at Athens after these victories was attended with the most servile flattery; and the Athenians were not ashamed to raise altars to him as to a god, and consult his oracles. This uncommon success raised the jealousy of the successors of Alexander; and Seleucus, Cassander, and Lysimachus, united to destroy Antigonus and his son. Their hostile armies met at Ipsus, B. C. 301: Antigonus was killed in the battle; and Demetrius, after a severe loss, retired to Ephesus. The Athenians, who had lately adored him as a god, refused to admit him into their city. But he soon after ravaged the territory of Lysimachus, and reconciled himself to Seleucus, to whom he gave his daughter Stratonice in marriage. Athens now laboured under tyranny, and Demetrius relieved it a second time, and pardoned the inhabitants. The loss of his possessions in Asia recalled him from Greece, and he established himself on the throne of Macedonia by killing Alexander, in self-defence. Here he was continually at war with the neighbouring states, and the superior power of his adversaries obliged him to leave Macedonia, after he had sat on the throne for seven years. He passed into Asia, and attacked some of the provinces of Lysimachus with various success; but famine and pestilence, having destroyed the greatest part of his army, he applied to Seleucus for assistance. He met with a kind reception: but hostilities were again soon begun; and though he gained some advantages over his son-in-law, he was at last forsaken by his troops, and taken prisoner. Though he was kept in confinement by Seleucus, yet he maintained himself like a prince, and passed his time in hunting and in every laborious exercise. His son Antigonus offered Seleucus all his possessions, and even his person, to procure his father's liberty; but all proved unavailing, and Demetrius died in the 54th year of his age, after a confinement of three years, B. C. 286. His remains were given to Antigonus, and honoured with a splendid funeral at Corinth, and thence conveyed by his friends with royal pomp to Demetrius.

DEMETRIUS, the disciple of Apollonius Tyaneus, a cynic philosopher in the age of Caligula. The emperor wished to gain the philosopher to his interest by a large present; but Demetrius refused it with indignation, and said, "If Caligula wishes to bribe me, let him send me his crown. Vespasian was displeased with his insolence, and banished him to an island. The cynic derided the punishment, and satirized the emperor. He died in an extreme old age; and Seneca observes, that "nature had brought him forth to shew mankind, that an exalted genius can live securely without being corrupted by the vices of the surrounding world."

DEMIANSKOI, a town of Russia, in the government of Tobolsk, 100 miles N.N.E. of Tobolsk.

DEMI-CANNON LOWEST, a great gun that carries a ball of thirty pounds weight, and six inches diameter. The diameter of the bore is six inches two-eighths parts.

DEMI-CANNON OF THE GREATEST SIZE, a gun six inches and six-eighths parts diameter in the bore, twelve feet long. It carries a ball of six inches five-eighths diameter, and thirty-six pounds weight.

DEMI-CANNON ORDINARY, a great gun six inches four-eighths diameter in the bore, twelve feet long. It carries a shot six inches one-sixth diameter, and thirty-two pounds weight.

DEMI-CULVERIN, ELDER SORT, a gun four inches six-eighths diameter in the bore, ten feet, one-third in length. It carries a ball four inches four-eighths parts diameter, and twelve pounds eleven ounces weight. It weighs 3000 pounds, and carries a ball point blank 178 paces.

DEMI-CULVERIN

DEMI-CULVERIN OF THE LOWEST SIZE, a gun four inches two-eighths diameter in the bore, and ten feet long. It carries a ball four inches diameter, and nine pounds weight. It is 2000 pound weight, and carries a ball 174 paces.

DEMI-CULVERIN ORDINARY, a gun four inches four-eighths diameter in the bore, ten feet long. It carries a ball four inches two-eighths diameter, and ten pounds eleven ounces weight. It is 2700 lb. weight, and carries a ball point blank 175 paces.

DEMI-GORGE, in fortification, is that part of the polygon which remains after the flank is raised, and goes from the curtain to the angle of the polygon. It is half of the vacant space or entrance into a bastion. See **FORTIFICATION**.

DEMI-LUNE, HALF-MOON, in fortification, an outwork consisting of two faces and two little flanks, frequently built before the angle of a bastion, and sometimes also before the curtain, though now much disused. See **FORTIFICATION**.

DEMIQUAVER, a note in music, two of which are equal to a quaver.

DEMISE, in law, is applied to an estate either in fee simple, fee tail, or for term of life or years; and so it is commonly taken in many writs.

DEMISE, and **RE-DEMISE**, denote a conveyance where there are mutual leases made from one to another of the same land, or something out of it.

DEMI-SEMI-QUAVER, in music, the shortest note, two of them being equal to a semi-quaver.

DEMIURGE, [from *δημιος*, a public servant, and *εργον*, work,] in the mythology of the eastern philosophers, was one of the *Æons* employed by the supreme Deity in the creation of the world. The character they give him is a compound of shining qualities and insupportable arrogance; and his excessive lust of empire effaces his talents and virtues. He is represented as claiming dominion over the new world he has formed, as his sovereign right; and excluding totally the supreme Deity from all concern in it, he demands from mankind, for himself and his associates, divine honours.

DEMMIN, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania, 26 miles S. of Stralsund.

DEMOCIDES, a celebrated physician of Croton, who was famous for his attachment to his native soil. Though caressed and enriched by the king of Persia, whose queen he had snatched from the jaws of death, he abandoned wealth and honours, and by stratagem escaped to the humble comforts of a private life at Croton.

DEMOCRACY, [*δημοκρατία*, from *δemos*, the people, and *κρατία*, to govern,] literally signifies that form of government wherein the people govern, or are equally entitled to govern, themselves. In this sense of the word, the world has not yet seen a pure democracy. Among the ancient republics, the two that approached nearest to it were Athens and Rome. But in both these commonwealths there were distinctions of ranks, between certain privileged orders and the great body of the people, which were inconsistent with that perfect equality, which seems requisite to constitute the essence of a democracy. And personal slavery, which is not only inconsistent with liberty, but imperceptibly undermines it, wherever it is permitted, disgraced the constitutions of both. All the modern states of Europe, that have assumed the name of republics within these few centuries, have been more or less aristocratic. Venice was the most tyrannical aristocracy that ever existed. Genoa was not much better; and of the Swiss cantons, all but one were mere oligarchies. Basil was the only one that had any thing like a democratic form of government, though even it was inferior to that of ancient Athens.

Holland was only a limited monarchy, with the substitution of the title stadtholder for that of King. Of the various republics which the present age has produced, not one can be strictly said to be a pure democracy. Among the sixteen United States of America, not above three have established that *sine qua non* of democracy, universal suffrage; and slavery is not only permitted, but interwoven with the very constitution of the whole United States, although the citizens of three of them have not taken advantage of this permission. And even in the French, Batavian, Cisalpine, Ligurian, Roman, and Helvetic republics, a pure democracy was far from being established, notwithstanding their boasted systems of liberty and equality. For although hereditary honours, distinctions of rank by titles, and ecclesiastical hierarchies, as well as personal slavery, were abolished in all of them, yet a very considerable part of the people had no vote in electing their governors;

even after the privileged electors had exercised their constitutional powers in choosing their representatives, we have seen by recent instances, that the directory (of France at least, and from them we may judge of the rest), could exercise a power beyond the constitution, of turning out and even banishing, a number of those representatives, upon mere alleged disaffection to the constitution, without so much as trial by jury, to establish the fact. In short we may safely say, the experiment of a pure democracy, wherein all do, or may, govern all, by frequent and free election and representation, has not yet been made. The French constitution of 1793, indeed, exhibited a plausible theory of such a perfect democracy; but while the fascinating plan was held out to the people in theory, it was never attempted to be reduced to practice; but, instead of it, the most absolute despotism took place, and a few individuals, assuming the whole power of the state, in their own hands, marked with indelible characters of blood the awful lesson to posterity, of the dreadful consequences of a conjunction of the legislative and executive powers, in the hands of any, but especially in those of a small oligarchy. On the whole, from all the experiments that have as yet been made, the philanthropic philosopher will be apt to doubt, whether a perfect democracy is not inconsistent with the present imperfect state of human nature; and whether, wherever it is attempted to be established, the ungovernable passions of mankind will not soon make it degenerate either into a tyrannical oligarchy, or absolute anarchy.

DEMOCRITUS, a famous philosopher of antiquity, was born at Abdera, in Thrace, about the 80th Olympiad, or B. C. 460. His father, says Valerius Maximus, was able to entertain the army of Xerxes. At his father's death it is said that his portion amounted to about 100 talents, which is near 20,000*l.* sterling. His extraordinary love of knowledge, induced him to travel into all countries famed for learned men. He went to visit the priests of Egypt, from whom he learned geometry; he consulted the Chaldean and the Persian philosophers, and it is said that he penetrated even into India and Ethiopia, to confer with the Gymnosophists. In these travels he wasted his substance, so that on his return, he was obliged to be maintained by his brother; notwithstanding which, he gave such proofs of superior understanding, that he procured the highest honours of his country; which he governed with unlimited sway, as well as consummate wisdom. The magistrates of Abdera made him a present of 500 talents, and erected statues to him even in his lifetime: but being naturally more inclined to contemplation than delighted with public honours and employments, he withdrew into solitude and retirement. He incessantly laughed at human life, as a continued farce, which made the inhabitants of Abdera think he was mad; on which he sent for Hippocrates to cure him; but that celebrated physician having discoursed with the philosopher, expresses the utmost veneration for him, and told the Abderians, that those who esteemed themselves the most healthy were the most distempered. Democritus died, according to Diogenes Laertius, aged 109. He was the author of many books, which are lost; and from these Epicurus borrowed his philosophy.

DEMOIVRE, ABRAHAM, an eminent French mathematician, born at Vitry, in Champagne, in May 1667. Being a protestant, he fled to London upon the revocation of the edict of Nantes, in 1685. He had studied mathematics in France, but the *Principia Mathematica* of Sir Isaac Newton soon convinced him how little he had advanced in the science he professed to teach. He fell hard to work; made himself master of Newton's principles, and soon became connected with, and celebrated among the first rate mathematicians. His abilities soon procured him an admission into the Royal Society of London, and afterwards into the Academy of Sciences at Paris. His merit was so acknowledged by the former, that they judged him a fit person to decide the famous contest between Newton and Leibnitz. The collection of the academy at Paris contains no memoir of this author, who died at London, Nov. 1754, soon after his admission into it; but the Philosophical Transactions of London have several, and all of them interesting. He published also some capital works, such as, "*Miscellanea Analytica, de Seriebus & Quadraturis*," 1730, 4to. But perhaps he has been more generally known by his "*Doctrine of Chances*; or Method of calculating the Probabilities of Events at Play." This work was first printed 1718, in 4to, and dedicated to Sir Isaac Newton: it was reprinted 1738, with great alterations and improvements; and a third edition was afterwards published

with additions, and "A Treatise on Annuities," dedicated to Lord Carpenter.

DEMON. See **DÆMON**.

DEMONA, or VAL DI DEMONA, [*i. e.* the valley of demons,] a province of Sicily, so called from mount *Ætna* being situated in it, whose continual flames led the superstitious inhabitants anciently to believe that it was a chimney of hell.

DEMONOLOGY, [*δαίμων* and *λογία*,] discourse of the nature of devils. Thus king James entitled his book concerning witches.

DEMONSTRABLE, a term used in the schools, to signify that a thing may be clearly proved. Thus it is demonstrable, that the three angles of a triangle, are equal to two right ones.

DEMONSTRATION, [*demonstratio*, Lat.] in logic, a series of syllogisms, all whose premises are either definitions, self-evident truths, or propositions already established. See **LOGIC**.

DEMONSTRATIVE, in grammar, a term given to such pronouns as serve to demonstrate or point out a thing or person. Of this number are *hic, hac, hoc*, among the Latins; and *this, that, these, those*, in English.

DEMOSTHENES, the famous Athenian orator, was born at Athens, B. C. 381. He lost his father at seven years of age; and was placed under the conduct of guardians, who robbed him of his substance, and neglected his education. Demosthenes soon repaired this loss by his extraordinary abilities. He became the disciple of Isæus and Plato, and studied the orations of Isocrates. At the age of 17 he gave a proof of his eloquence and abilities against his guardians, from whom he recovered the greatest part of his estate. His rising talents were, however, impeded by various natural defects, but which he overcame by dint of resolution and unwearied attention. He declaimed by the sea-shore, that he might be used to the noise of a tumultuous assembly; and with pebbles in his mouth, that he might correct a defect in his speech. He practised at home with a naked sword hanging over his shoulder, that he might check an ungraceful motion to which he was subject. He confined himself in a subterraneous cave, to devote himself more closely to study; and to check all inclination to appear in public, he shaved one-half of his head. In this solitary retirement, by the help of a glimmering lamp, he composed the greatest part of his orations, which have since been the admiration of all ages, though his contemporaries and rivals inveighed against them, and observed that they smelt of oil. His abilities as an orator raised him to consequence at Athens, and he was soon placed at the head of government. In this public capacity he roused his countrymen from their indolence, and animated them against the encroachments of Philip of Macedonia. In the battle of Cheronæa, however, his eloquence could not supply the want of courage, and he saved his life by flight. After the death of Philip, he declared himself warmly against his son Alexander; when the Macedonians demanded of the Athenians their orators, Demosthenes reminded his countrymen of the fable of the sheep which delivered up their dogs to the wolves. By the prevalence of party, however, he was forced to retire to Trœzen in *Ægina*, where, it is said, he lived with more effeminacy than heroism. When Antipater made war against Greece after the death of Alexander, Demosthenes was publicly recalled from his exile, and a galley was sent to fetch him from *Ægina*. His return was attended with much splendor, and all the citizens crowded at the Piræus to see him land. But his triumph and popularity were short. Antipater and Craterus were near Athens, and demanded all the orators to be delivered up into their hands. Demosthenes fled to the temple of Neptune in Calauria; when he saw no hopes of safety, he took a dose of poison, which he always carried in a quill, and expired on the day that the Thesmophoria were celebrated, B. C. 322. The Athenians raised a brazen statue to his honour, with a suitable inscription. Demosthenes has been deservedly called the prince of orators. Indeed no orator had ever a finer field than Demosthenes in his *Olynthiacs* and *Philippics*, which are his capital orations; and undoubtedly to the greatness of the subject, and to that integrity, and public spirit, which breathe in them, they owe a large portion of their merit. The subject is, to excite the indignation of his countrymen against Philip of Macedon, the public enemy of the liberties of Greece; and to guard them against the treacherous measures by which that crafty tyrant endeavoured to lull them into a neglect of their danger. To attain this end, he uses every proper means to animate a people, distinguished by justice, humanity, and valour, but in many instances become cor-

rupt and degenerate. He boldly accuses them of venality, indolence, and indifference, to the public good; while at the same time, he reminds them of their former glory, and of their present resources. His contemporary orators, who were bribed by Philip, and who persuaded the people to peace, he openly reproaches as traitors to their country. He not only prompts to vigorous measures, but teaches how they are to be carried into execution. His orations are strongly animated, and full of the impetuosity and ardour of public spirit. His composition is not distinguished by ornament and splendor. It is an energy of thought, peculiarly his own, which forms his character, and raises him above his species. He seems not to attend to words, but to things. We forget the orator, and think of the subject. He has no parade and ostentation, no studied introductions; but is like a man full of his subject, who, after preparing his audience by a sentence or two for the reception of plain truths, enters directly on business. The style of Demosthenes is strong and concise; though sometimes it must be confessed, harsh and abrupt. His words are highly expressive, and his arrangement firm and manly. Negligent of less graces, he seems to have aimed at that true sublime which lies in sentiment. His action and pronunciation are said to have been uncommonly vehement and ardent; which, from the manner of his writings, we should readily believe. His character appears to have been of the austere rather than of the gentle kind. He is always grave, serious, and passionate; never degrading himself, nor attempting any thing like pleasantry. If his admirable eloquence be in any respect faulty, it is that he sometimes borders on the hard and dry. He may be thought to want smoothness and grace; which is attributed to his imitating too closely the manner of Thucydides, who was his great model for style, and whose history he is said to have transcribed eight times with his own hand. But these defects are more than atoned for by that masterly force of masculine eloquence, which, as it overpowered all who heard it, cannot, even in the present day, be read without emotion. Cicero calls him a perfect model, and such as he himself wished to be. These two great princes of eloquence have been often compared together; but the judgement hesitates to which to give the preference. The archbishop of Cambray, however, seems to have stated their merits with great justice and perspicuity, in his "Reflections on Rhetoric, and Poetry." "I do not hesitate (says he) to declare, that I think Demosthenes superior to Cicero. I am persuaded no one can admire Cicero more than I do. He adorns whatever he attempts. He does honour to language. He disposes of words in a manner peculiar to himself. His style has great variety of character. Whenever he pleases, he is even concise and vehement; for instance, against Catiline, against Verres, against Antony. But ornament is too visible in his writings. His art is wonderful, but it is perceived. When the orator is providing for the safety of the republic, he forgets not himself, nor permits others to forget him. Demosthenes seems to escape from himself, and to see nothing but his country. He seeks not elegance of expression; unsought for, he possesses it. He is superior to admiration. He makes use of language, as a modest man does of dress, only to cover him. He thunders, he lightens. He is a torrent which carries every thing before it. We cannot criticise because we are not ourselves. His subject enchains our attention, and makes us forget his language. We lose him from our sight: Philip alone occupies our minds. I am delighted with both these orators; but I confess that I am less affected by the infinite art and magnificent eloquence of Cicero, than by the rapid simplicity of Demosthenes."

DEMPSTER OF COURT, the name formerly given in Scotland to the common executioner, or hangman.

DEMSTER, or DEEMSTER. See **DEEMSTER**.

DEMULCENTS, among physicians, medicines good against acrimonious humours. Such are the roots of marsh-mallows, white lilies, liquorice, and viper-grass, the five emollient herbs, &c.

DEMURRAGE, [from *demur*,] an allowance made by merchants to masters of ships, for their stay in a port beyond the time appointed.

DEMURRER, [*demeurer*, Fr. *i. e.* *manere in aliquo loco, vel morari*,] a kind of pause upon a point of difficulty in an action; for, in every action, the controversy consists either in the fact, or in the law: if in the fact, that is tried by the jury; if in law, then is the case plain to the judge, or so hard and rare, as it breedeth just

just doubt. I call that plain to the judge, wherein he is assured of the law; and in such case the judge, with his associates, proceeds to judgement without farther work. But when it is doubtful to him and his associates, then is their stay made, and a time taken, either for the court to think farther upon it, and to agree, if they can; or else for all the justices to meet together in the Chequer-chamber, and, upon hearing that which the serjeants can say of both parts, to advise, and set down as law, whatsoever they conclude firm, without farther remedy.

DEN, [*den*, Sax.] 1. A cavern or hollow running horizontally, or with a small obliquity under ground; distinct from a hole which runs down perpendicularly. 2. The cave of a wild beast. 3. Den, the termination of a local name, may signify either a valley or a woody place; for the Saxon *den* imports both. It is only near the sea, on a high coast, that dens exist. They are very distinct from glens, which are valleys between hills. These you can easily survey in all their grandeur, from the summit of the hill on either side. But you cannot judge from the appearance of the adjacent grounds, which are highly cultivated, and rise not above the level of the surrounding fields, that there are any such objects as dens, till you come close upon them; and the illusion greatly heightens the pleasure of the spectator. Dens sink suddenly from the common level of the country, and seem to owe their origin to some rivulet or stream: which issuing from springs on the higher lands, and meeting with soft materials on its way, has washed away all these in the course of ages, till it found the hard bottom.

DENARIUS, [*Lat.*] in antiquity, the chief silver coin among the Romans, worth in our money about $7\frac{1}{2}d.$ at $5s. 2d.$ per ounce, or $8d.$ when bullion is high priced. It was about the size of a sixpence but much thicker, and had the emperor's head on the one side: the figures on the reverse were various. In our translation of the New Testament, the denarius is called a penny. See Matth. xxii. 19. A considerable quantity of Denarii, with the heads of Nero, Vespasian, Titus, Domitian, Nerva, Trajan, and Adrian were found near Stirling, in 1766.

DENARIUS was also the name of a Roman weight; the 7th part of an ounce.

DENARIUS is likewise used in our law-books for an English penny.

DENBIGH, or **DENBIGHSHIRE**, a county of N. Wales, bounded on the S. by Merioneth and Montgomery shires, on the N. by part of Flintshire and the Irish sea, on the W. by Caernarvon and part of Merionethshire; and on the E. by Shropshire and Flintshire. It is 48 miles long and 21 broad. The air is wholesome, but sharp; the county being pretty hilly, and the snow lying long on the tops of the mountains.

DENBIGH, the capital of Denbighshire, in N. Wales, 27 miles W. of Chester.

DENDER, a river of France, which runs into the Scheldt at Dendermond.

DENDERA, a town of Egypt, on the W. side of the Nile, at the edge of a small but fertile plain, about half a mile from the river.

DENDERMOND, a handsome town of France, in the department of Dyle, 14 miles E. of Ghent.

DENDRACHATES, in natural history, [from *δένδρον*, a tree, and *αχάτης*, an agate,] the name used by the ancients for an extremely elegant and beautiful species of agate, the ground of which is whitish, variegated with veins of a brighter white, and often very beautiful delineations of trees, mosses, sea-plants, and the like. See **DENDRITES**.

DENDRANATOMY, a term used by some for a description of the various parts of trees; as the root, trunk, branch, bark, wood, pith, flower, fruit, &c. See **PLANTS**, **VEGETATION**, &c.

DENDRITES, or **ARBORIZATIONS**. This appellation is given to figures of vegetables which are frequently observed in fossil substances. These are of two kinds; the one superficial, the other internal. The first are chiefly found on the surface of stones, and between the strata and in the fissures of those of a calcareous nature. Stones of a similar kind, when very compact, sometimes also exhibit internal arborizations; such are the marbles of Hesse, of Angersburg in Prussia, and of Baden-Doullach on the left bank of the Rhine. Several of these dendrites bear a striking resemblance to the poplar; while others exhibit the straight stem, py-

ramidal form, and pendant branches, of the fir. Some specimens of dendrites found in Switzerland, represent, in a very surprising manner, plantations of willows; and many of them are so beautiful, as really to appear the work of art. The superficial dendrites are mostly of a brown, changing gradually to a reddish yellow. The internal dendrites are of a deep black. The most esteemed dendrites are those found in agates; and more particularly in the sardonyx, cornelian, and other precious stones, brought from the East, and which are commonly denominated Moka stones. The Oriental agates display the most varied and beautiful forms. Sometimes they exhibit the appearance of terraces covered with different species of moss, interspersed with plants of the fern-tribe, having large leaves, and the outlines exquisitely finished; the colours are likewise extremely brilliant. A species of metallic dendrites is sometimes formed by means of fire. For example, some kinds of copper ore, on being subjected to the action of heat, and afterwards withdrawn from the furnace, appear covered with brilliant yellow spots, some inches in diameter, exactly resembling in form lichens growing on rocks. These arborizations, which are of pure copper, are very singular; being composed of vertical threads, of about a line in height, united in fasciculi, like so many small sheaves standing upright by the side of each other. The finest specimens of this kind of metallic dendrites are produced at a foundry on the Oural mountains. The ore with which this foundry is supplied, is brought from the mines of Touria, where the most beautiful native copper in a state of vegetation yet known, is to be found. In whatever manner we may be inclined to account for this wonderful phenomenon, it should seem, from the above fact, that the same cause which produces these arborizations in the mine, must likewise produce the same effect after the ore has been subjected to the action of fire. See Plate LIV. fig. 7, and 8.

DENDROMETER, [from *δένδρον*, a tree, and *μετρώω*, to measure,] an instrument lately invented by Messrs. Duncombe and Whittle, for which they obtained a patent, so called from its use in measuring trees. See Plate LIV. fig. 5, and 6. This instrument consists of a semicircle A, divided into two quadrants, and graduated from the middle; upon the diameter B there hangs a plummet L for fixing the instrument in a vertical position; there is also a chord D parallel to the diameter, and a radius E, passing at right angles through the diameter and chord. From a point on the radius hangs an altimeter C, between the chord and diameter, to which is fixed a small semi-circle G, and a screw, to confine it in any position. The altimeter, which is contrived to form the same angle with the radius of the instrument as the tree forms with the horizon, is divided from its centre both ways into forty equal parts; and these parts are again subdivided into halves and quarters. Upon the small semicircle G, on which is accounted the quantity of the angle made by the altimeter and radius, are expressed degrees from 60 to 120, being 30 on each quadrant. The radius is numbered with the same scale of divisions as the altimeter. There is also a nonius to the small semicircle, which shews the quantity of an angle to every five minutes. On the back of the instrument, fig 6, the stock, M, of the sliding piece is confined to the axis N, which moves concentrically parallel to the elevation index F on the opposite side, to which it is fixed. This index is numbered by a scale of equal divisions with the altimeter and radius: at the end of the index is a nonius, by which the angles of elevation above, or of depression below, the horizon, measured upon the semicircle of the instrument, are determined to every five minutes. There is also a groove in the radius, that slides across the axis by means of a screw I, working between the chord and semicircle of the instrument; and this screw is turned by the key. Upon the stock M is a sliding piece P, that always acts at right angles with the altimeter, by means of a groove in the latter. To the shank of the sliding piece is affixed a moveable limb Q, which forms the same angle with the altimeter as the bough forms with the body or trunk of the tree. This limb may be of any convenient length, divided into equal parts of the same scale with all the foregoing divisions. At the extremity of the fixed axis, on a centre, an index R, with telescopic sights, works horizontally upon the moveable limb of the sliding piece. Upon this horizontal index R may be fixed a small quadrant T, described with any convenient radius from the centre on which the index moves, and divided into 90 degrees, beginning at a right

line drawn from the centre at right angles with the fiducial edge of the said index; and upon the extremity of the axis is a nonius, whereby to determine the quantity of an angle upon the quadrant to every five minutes. There are also two small circular arches S, S, serving to keep the sights in a parallel position, each containing an equal number of degrees. Upon these arches is measured the angle, subtending a side equal to the difference of the altitudes of the observed objects above the plane of the horizon, and whose base is the nearest distance between the perpendiculars in which these objects are situated. The dendrometer is fitted to a theodolite, and may be used either with or without it as occasion requires. The principal use of this instrument is for measuring the length and diameter of any tree, perpendicular or oblique, to an horizontal plane, or in any situation of the plane on which it rests, or of any figure, whether regular or irregular, and also the length and diameter of the boughs, by mere inspection; and the inventors of it have calculated tables, annexed to their account of the instrument itself, by the help of which the quantity of timber in a tree is obtained without calculation, or the use of the sliding rule. The instrument is rectified by setting it in a perpendicular position, by means of the plummet, and screwing it to the staff; then the altimeter is placed in the exact position of the tree, whether perpendicular, reclining, or inclining, and screwed fast. If the tree stands on level ground, the horizontal distance from the tree to the axis of the instrument is measured with a tape line, and the radius is moved with a key till that distance be cut upon it by the inside of the diameter; but if the ground be slanting, the distance from the tree to the instrument is measured, and the elevation index is moved till the point of the tree from which the distance was measured is seen through the sights, and there screwed fast; and the radius is moved backwards or forwards with the key till this distance is cut upon the elevation index by the perpendicular line of the altimeter; and the horizontal line will be marked upon the radius by the inside of the diameter. To obtain the length of the tree, the elevation index is first moved downwards, till the bottom of the tree cut by the horizontal wires is observed through the sights, and the feet and inches marked by the index upon the altimeter below the point of sight or horizontal line are noted down: then the index is moved upwards till the part to which you would measure, cut by the horizontal wires, is seen, and the feet and inches marked on the altimeter above the point of sight are noted: these two quantities added together give the exact length of the tree, which is inserted in a field book. For the girth of the tree, the circumference in that part where the horizontal distance was taken, is measured with the tape line; and a sixth part of this circumference is added to the distance on the radius, which was before cut by the inside of the diameter, because the tape line, in taking the distance cannot be applied to the centre of the body of the tree; then the elevation index is lowered to that part of the tree, of which the diameter is to be taken and screwed fast. Set the moveable limb of the sliding piece quite straight, and the edge of the horizontal index upon the first division of it. Turn the whole instrument about to the left hand till the left side of the tree is seen, through the sights, cut exactly by the perpendicular wires; then the instrument being fixed, move the sights only upon the sliding piece, till the right side of the tree is also seen cut by the perpendicular wires: and the true diameter will be found marked by the horizontal index upon the sliding piece, which is to be entered in a distinct column of the field book. For the boughs; let the distance on the radius be now deducted to its former quantity, and the elevation index moved upwards till the bough is seen through the sights and screwed fast. Set the moveable part of the sliding piece in a position parallel to the bough, and the edge of the horizontal index on the first division of it. Turn the whole instrument about till you see through the sights the shoot of the bough close to the trunk cut by the perpendicular wires; then move the sights till you see the other end of the bough cut by the said wires, and note the feet and inches marked by the horizontal index on the moveable limb of the sliding piece, which will give the true length of the bough to be inserted in the field book. And the girth of the bough may be obtained by directing the sights to that part of it whose girth is desired; then by moving the elevation index downwards till you see the under side of the bough cut by the horizontal wires, and there noting the feet and inches marked by the said index on the altimeter; after which

let the elevation index be moved upwards till the upper side of the bough cut by the horizontal wires is seen; the feet and inches marked upon the altimeter are to be noted as before. The former quantity subtracted from the latter will give the true diameter of the bough, which is entered in the field book. The true solidity both of the body of the tree and of the boughs may be found from the diameter and lengths in tables calculated for this purpose. The dendrometer, fitted to a theodolite, may be applied to measuring the heights and distances of objects, accessible or inaccessible, whether situated in planes parallel or oblique to the plane in which the instrument is placed. It may be also used for taking all angles, whether vertical, horizontal, or oblique, in any position of the planes in which they are formed; and thus for facilitating the practical operations of engineering, land surveying, levelling, mining, &c. and for performing the various cases of plane trigonometry without calculation; of which the inventors have subjoined to their account of this instrument many examples.

DENDROPHORI, [from *δένδρον*, a tree, and *φέρω*, to bear,] tree-bearers, in antiquity, priests who marched in procession, carrying branches of trees in their hands in honour of some god, as Bacchus, Cybele, Solvanus, &c.

DENDROPHORIA, in antiquity, the religious ceremony of carrying branches of trees. See last article.

DENEB, an Arabic term, signifying tail, used by astronomers to denote several fixed stars. Thus,

1. **DENEB ADIGEGE** signifies the bright star in the swan's tail.

2. **DENEB ELEET**, that in the lion's tail.

DENIA, a sea-port of Spain, in the province of Valencia.

DENIER, [from *denarius*, Lat. It is pronounced as *deneer*, in two syllables,] a small French copper coin, of which 12 make a sol. There are two kinds of deniers, the one tournois, the other parisien, whereof the latter is worth a fourth part more than the former.

DENIER is also the name of a small weight used in assaying silver. Like the carat used in trying and expressing the fineness of gold, it is rather imaginary, than real, as the whole mass of silver, whatever be its weight, is supposed to be divided into twelve deniers; and as many 12th parts as it contains of pure silver, it is called silver of so many deniers fine. Thus Sterling silver of eleven deniers fine, the standard degree of fineness, of which the British coin consists, and of which all silver manufactured into plate and sold by weight, ought to consist, is a mixture, of which eleven parts are pure silver and one part copper. Each denier is supposed to be divided into 24 grains: and thus estimating pure silver at six shillings per ounce an ounce of Sterling silver is worth five shillings and six-pence, and the fineness of any quantity of silver can be calculated with the utmost exactness to half a grain in purity, or half a farthing in value per ounce. The deniers and grains, used by the assaymasters for this purpose, are real weights, made with the most scrupulous exactness in the above proportions to each other.

DENIZEN, in law, an alien made a subject by the king's letters-patent; otherwise called donation, because, "his legitimation proceeds ex donatione regis, from the king's gift." A denizen is in a kind of middle state between an alien and a natural born subject, and partakes of both of them. He may take lands by purchase or devise, which an alien may not; but cannot take by inheritance; for his parent, through whom he must claim, being an alien, had no inheritable blood, and therefore could convey none to the son; and upon a like defect of blood, the issue of a denizen born before denization cannot inherit to him; but his issue born after may. A denizen is not excused from paying the alien's duty, and some other mercantile burdens. And no denizen can be of the privy council, or either house of parliament, or have any office of trust civil or military, or be capable of any grant of lands, &c. from the crown.

DENMARK, one of the most ancient monarchies in Europe, comprehending the peninsula of Jutland, and the islands of Zealand, Funen, &c. But Denmark, properly so called, is only that part of Scandinavia, which formerly went by the name of Cimbrica Chersonesus, and is now called Jutland. Including Holstein, it is bounded by the Categate on the N. by the Baltic on the E. by the Elbe, which separates it from Bremen, on the S. and by the duchy of Saxe-

Saxe-Lawenburg towards the S. E. extending from 54. 40. to 58. 20. Lat. N. The kingdom of Denmark is divided into six grand districts or provinces; viz. 1. Denmark properly so called, comprehending the islands of Zealand, Funen, Langeland, Laaland, Falstria, Mona, Samsoe, Arroe, Bornholm, Anholt, Lessaw, and that part of the continent called North Jutland. 2. The duchy of Sleswick, or South Jutland. 3. The duchy of Holstein. 4. The earldoms of Oldenburgh and Delmenhorst. 5. The kingdom of Norway; and 6. Iceland, with the islands lying in the Northern Seas. The whole kingdom is also divided into six dioceses; viz. one in Zealand, one in Funen, and four in Jutland. Saxo Grammaticus, the most ancient and best of the Danish historians, derives the name of Denmark from Dan the son of Humble, the first king, and Mark, a word signifying a country in several dialects of the Teutonic; according to which etymology, the word Denmark signifies the country of Dan. This Dan is said to have flourished about A. D. 1038, or 1050. The language of Denmark is a dialect of the Teutonic, and bears a strong affinity to the Norwegian tongue; but is disagreeable to strangers, on account of the drawling tone with which it is pronounced. They have borrowed many words from the German; and, indeed, the high Dutch is used in common discourse by the court, the gentry, and the burghers; who likewise understand French, and speak it fluently. The Lutheran doctrine is universally embraced throughout all Denmark, Sweden, and Norway; so that there is not another sect in these kingdoms. The laws of Denmark are so concise, that the whole body is contained in one 4to volume, written in the language of the country. Every man may plead his own cause, without employing either counsel or attorney: but there are a few advocates for the benefit of those who cannot or will not speak in their own defence. The proceedings are so summary, that a suit may be carried through all the courts, and finally decided, in 13 months. There are three courts in Denmark, and an appeal lies from the inferior to the superior tribunal. The lowest of these is, in cities and towns, denominated the Byfogtids court; and in the country the Herredsfogds. Causes may be appealed from this to the Landstag, or general head court for the province: but the final appeal lies to the High Right in Copenhagen, where the king presides in person, assisted by the prime nobility.

DENN, a town of Arabia, in the county of Yemen. Lon. 43 43. E. Lat. 14. 15. N.

DENOMINATION, [*denominatio*, Lat.] a name given to a thing, which commonly marks some principal quality of it.

DENOMINATOR OF A FRACTION, is the number below the line, shewing the nature and quality of the parts which any integer is supposed to be divided into: thus in $\frac{2}{8}$, 8 the denominator shews you, that the integer is supposed to be divided into eight parts, or half-quarters: and the numerator six shews, that you take six of such parts, i. e. three quarters of the whole. See ARITHMETIC.

DENOMINATOR OF A RATIO, is the quotient arising from the division of the antecedent by the consequent. Thus 8 is the denominator of the ratio 40 : 5, because 40 divided by 5, gives 8, for a quotient. It is also called the exponent of a ratio. See EXPONENT.

DENSITY OF BODIES, is that property directly opposite to rarity, whereby they contain a certain quantity of matter under a certain bulk. Accordingly, a body is said to have double or triple the density of another body, when, their bulk being equal, the quantity of matter is in the one double or triple the quantity of matter in the other.

DENSITY OF THE AIR, is a property that has employed the later philosophers, since the discovery of the Torricellian experiment. It is demonstrated, that in the same vessel, or even in vessels communicating with each other, at the same distance from the centre, the air has every where the same density. The density of air, *ceteris paribus*, increases in proportion to the compressing powers. Hence the inferior air is denser than the superior; the density, however, of the lower air is not proportional to the weight of the atmosphere on account of heat and cold, and other causes perhaps which make great alterations in density and rarity. However, from the elasticity of the air, its density must be always different at different heights from the earth's surface; for the lower parts being pressed by the weight of those above, will be made to accede nearer to each other, and the more so as the weight of the incumbent air is greater. Hence the density of the air is greatest at the earth's surface, and decreases upwards in geometrical pro-

portion to the altitudes taken in arithmetical progression. If the air be rendered denser, the weight of bodies in it is diminished: if rarer, increased, because bodies lose a greater part of their weight in denser than in rarer mediums. Hence, if the density of the air be sensibly altered, bodies equally heavy in a rarer air, if their specific gravities be considerably different, will lose their equilibrium in the denser, and the specifically heavier body will preponderate. See PNEUMATICS, and HYDROSTATICS.

DENSITIES OF THE PLANETS. See ASTRONOMY.

DENTALIUM, TOOTH-SHELL, in natural history, a genus of the class and order vermes testacea. Animal a terebella; shell univalve, tubular, straight or slightly curved, with the cavity open at both ends, and undivided. It has twenty two species, some of which are found in the fossil state. There are but few species in this country, and those principally of the minuter kind.

DENTARIA, TOOTH-WORT, or TOOTH-VIOLET: a genus of the siliquosa order, and tetradynamia class of plants; natural order, Siliquose. Siliqua parts with a spring; valvules roll spirally backwards; stigma emarginated; calyx closing longitudinally. There are four species, hardy perennials; producing annual stalks twelve or eighteen inches high, adorned with many lobed-leaves, and spikes of quadripetalous cruciform flowers of a red or purple colour. They delight in shady places; and are propagated either by seeds or parting the roots.

DENTATUS, SICCUS, a hero of ancient Rome, of the plebeian order, but of uncommon merit, who flourished about A. U. C. 300. When disputes ran high between the patricians and plebeians, about the Agrarian law, Dentatus, loaded with glory, and advanced in years, but still exhibiting an admirable person, set off with all the dignity of a military veteran, addressed the people and expatiated upon his achievements and his hardships. He had served his country in the wars forty years; he had been an officer thirty; first a centurion and then a tribune; he had fought in 120 battles, and by the force of his single arm had saved the lives of a multitude of his fellow-citizens: He had gained fourteen civic, three mural, and eight golden crowns; besides 83 chains, 60 bracelets, 18 gilt spears, and 23 horse trappings, whereof nine were for killing the enemy in single combat; and he had received 45 wounds, all before, none behind. These were his honours; yet notwithstanding all this, he had never received any share of those lands which were won from the enemy, but continued to drag on a life of poverty and contempt, whilst others possessed those very territories which his valour had won, without any merit to deserve them, or ever having contributed to the conquest. Dentatus's speech, and the hardship of his case, had a strong effect. The people unanimously demanded that the law might be passed, and that such high merit should not pass unrewarded. Some of the senators attempted to speak but were overpowered by the cries of the people. At last a number of resolute young patricians rushing furiously amongst the crowd, broke the balloting urns, and dispersed the multitude. For this riot they were fined by the tribunes, but they gained their object for the time, by getting the Agrarian law postponed. Such was the justice of the Roman patricians, at one of the most virtuous periods of that celebrated republic; for it was the age of Cincinnatus himself.

DENTELLA, a genus of the monogynia order, and pentandria class of plants. Calyx a five-parted perianthium, with small subulated leaves; filaments short; anthera subulated, small; capsule globular, bilocular, egg-shaped, very numerous. It has one species, a native of New Caledonia.

DENTIFRICE, [*dens* and *frico*, Lat.]. a powder made to scour the teeth.

DENTIFRICES are of different kinds; generally made of earthy substances finely pounded, and mixed with alum, or some other saline substances: but these are pernicious, on account of their wearing away the enamel of the teeth; but more especially by the septic quality with which these earthy substances are endowed. On this account, a portion of Peruvian bark finely pounded is now commonly added, which answers the double purpose of cleaning the teeth, and preserving them afterwards from corruption.

DENTILES, or DENTILS, in architecture, an ornament in corniches bearing some resemblance to teeth, particularly used in the Ionic and Corinthian orders. See ARCHITECTURE.

DENTISCALPRA, in surgery, an instrument for scouring yellow, livid, or black teeth; to which being applied near the gums, it scrapes off the foul morbid crust.

DENTITION.

DENTITION. See MEDICINE.

DENTON, the chief town of Caroline county in Maryland, 37 miles S. S. E. of Chester.

DENYS, *Str.*, a town of France, in the department of Paris, five miles N. of Paris.

DEOBSTRUENT, [*deobstruens*, Lat.] a medicine that has power to resolve viscidities, or to open by any means the animal passages. See DETERGENT.

DEODAND, [*Deo dandum*, Lat.] a thing given or consecrated to God for the pacifying of his wrath, in case of any misfortune, by which any Christian comes to a violent end, without the fault of any reasonable creature; as, if a horse should strike his keeper, and so kill him; if a man, in driving a cart, and endeavouring to rectify something about it, should fall so as the cart-wheels, by running over him, should press him to death; if any one should be felling a tree, and giving warning to company by, when the tree was near falling, to look to themselves, and any of them should nevertheless be slain by the fall of the tree: in these cases the horse, the cart-wheel, cart and horses, and the tree, are to be given to God; that is, sold and distributed to the poor, for an expiation of this dreadful event, though occasioned by unreasonable, senseless, and dead creatures; and though this be giving to God, yet it is forfeited to the king by law, as executor in this case, to see the price of these distributed to the poor.

DEOGUR, a town of Hindostan, in the country of Berar, 55 miles N. N. W. of Nagpore.

DEPARTMENT, in modern geography is used as a substitute for province, in the new divisions of the French Government.

DEPARTURE, in navigation, is the easting or westing of a ship in respect of the meridian it departed or sailed from: or it is the difference of longitude, either east or west, between the present meridian the ship is under, and that where the last reckoning or observation was made. This departure, any where but under the equator, must be accounted according to the number of miles in a degree, proper to the parallel the ship is under. See NAVIGATION.

DEPHLOGISTICATED, a term applied by Dr. Priestley, to what is now called oxygen gas, when he first discovered it. It was called by Scheele, who discovered it at the same time, vital air.

DEPILATORY MEDICINES, those applied to take off the hair: such are lime, and other caustic substances, which ought to be used with great caution.

DEPONENT, in Latin grammar, a term applied to verbs, which have active significations, but passive terminations or conjugations, and want one of their participles passive.

DEPORTATION, a sort of banishment used by the Romans, whereby some island or other place was allotted to a criminal for the place of his abode, with a prohibition not to stir out of the same on pain of death.

DEPOSIT, among civilians, something that is committed to the custody of a person, to be kept without any reward, and to be returned again on demand. Deposit is distinguished into simple and judiciary.

DEPOSITION. Proof in the high court of chancery is by the depositions of witnesses; and the copies of such, regularly taken and published, are read as evidence at the hearing. For the purpose of examining witnesses in or near London, there is an examiner's office appointed; but for such as live in the country, a commission to examine witnesses is usually granted to four commissioners, two named on each side, or any three or two of them, to take the depositions there. And if the witnesses reside beyond sea, a commission may be had to examine them there, upon their own oaths; and if foreigners, upon the oaths of two skilful interpreters. The commissioners are sworn to take the examinations truly, and without partiality, and not to divulge them till published in the court of chancery; and their clerks are also sworn to secrecy. The witnesses are compellable by process of subpoena, as in the courts of common law, to appear and submit to examination; and when their depositions are taken, they are transmitted to the court with the same care that the answer of a defendant is sent. 3 Black. 445.

DEPOSITION also signifies the sequestering or depriving of a man of some dignity and office, and is nearly the same with degradation. See DEGRADATION.

DEPOT, in military affairs any particular place in which military stores are deposited for the use of an army. In a more exten-

sive sense, it means several magazines collected together for that purpose. It also signifies an appropriated fort, or place, for the reception of recruits, or detached parties, belonging to different regiments. The barracks near Maidstone are depots for the British cavalry, and Chatham is allotted to the infantry.

DEPRECATION, in rhetoric, a figure whereby the orator invokes the aid of some one; or prays for some great evil to befall him who speaks falsely, either himself or his adversary.

DEPRESSION OF AN EQUATION, in algebra, is the bringing it into lower and more simple terms by division. See ALGEBRA.

DEPRESSION OF A STAR, with astronomers, is the distance of a star from the horizon below, and is measured, by the arch of the vertical circle or azimuth, passing through the star, intercepted between the star and the horizon.

DEPRESSION OF THE POLE. When a person sails or travels towards the equator, he is said to depress the pole; because as many degrees as he approaches nearer the equator, so many degrees will the pole be nearer the horizon. This phenomenon arises from the spherical figure of the earth.

DEPRESSION OF THE VISIBLE HORIZON, or DIP OF THE HORIZON, denotes its sinking or dipping below the true horizontal plane, by the observer's eye being raised above the surface of the sea; in consequence of which the observed altitude of an object is by so much too great. See NAVIGATION.

DEPRIVATION in law, is when a clergyman, as a bishop, parson, vicar, or prebend, is deprived, or deposed, from his preferment, for any matter in fact or law: it is of two kinds, viz.

1. DEPRIVATION A BENEFICIO, when for some crime a minister is for ever deprived of his living.

2. DEPRIVATION AB OFFICIO, when a minister is for ever deprived of his order. It is the same with deposition and degradation. It is usually for some heinous crime deserving death, and is performed by the bishop in a solemn manner. See DEGRADATION.

DEPTFORD, a town of England, situated on the Thames, partly in the county of Kent, and partly in Surry. It was generally known in ancient records by the name of Deptford Strond, alias West Greenwich, a name which, in later times, became solely appropriated to the lower parts of it, on the banks of the Thames, the upper town retaining that of Deptford only. It is four miles E. of London.

DEPTH, in geometry, the same with altitude; though, strictly speaking, we only use the depth to denote how much one body, or part of a body, is below another. See HEIGHT, &c.

DEPTH OF A BATTALION, SQUADRON, &c. the number of men in a file, or who stand before each other in a straight line. In the ancient armies this was very great.

DEPURATORY FEVER, a name given by Sydenham to a fever which prevailed much in 1661, 1662, 1663, and 1664. He supposed that nature regulated all the symptoms in such a manner, as to fit the febrile matter, prepared by proper concoction, for expulsion in a certain time, either by a copious sweat or a freer perspiration.

DEPUTATION, a mission of select persons out of a company, or body, to a prince or assembly, to treat of matters in their name. They are more or less solemn, according to the quality of those who send them, and the business they are sent upon.

DEPUTY, is one that exercises an office in another's right; and the forfeiture or misdemeanor of such deputy shall cause the person, whom he represents, to lose his office. There is a great difference between a deputy and assignee of an office; for an assignee has an interest in the office itself, and does all things in his own name, for which his grantor shall not answer unless in special case; but a deputy has not any interest in the office, but is only the shadow of an officer, in whose name he does all things. 9 Rep. 49. A superior officer must answer for his deputy in civil actions if he is not sufficient; but in criminal cases it is otherwise, where deputies are to answer for themselves. 2 Inst. 191.

DERAS, a large town of Asia, in Persia. Lon. 61. 56. E. Lat. 31. 32. N.

DERBEND, or DERBENT, a town of Persia, said to have been founded by Alexander the Great. It is seated near the Caspian Sea, at the foot of Mount Caucasus.

DERBEND, or DERBENT, a town of Turkey, in Romania, twenty miles N. of Adrianople.

DERBY, or DERBYSHIRE, a county of England, bounded on

on the N. by Yorkshire; on the E. by Nottinghamshire; on the S. by Leicestershire; and a point of Warwickshire; on the W. by Staffordshire; and on the N. W. by Cheshire. It extends 59 miles in length from N. to S. and 34 from E. to W. where broadest. The principal rivers are the Derwent, Dove, Erwash, and Trent.

DERBY, the county town of Derbyshire, seated on the Derwent, over which it has a handsome stone bridge. It is 36 miles N. of Coventry. Lon. 1. 25. W. Lat. 52. 58. N.

DERBY, HIGH PEAK OF, a chain of very high mountains in Derbyshire. In these mountains there are two remarkable caverns, called Elden-hole, and Pool's-hole. The soil is so shallow that it hardly admits of plowing, but affords good pasture for sheep. The Peak properly so called, is reckoned the highest mountain in England.

DEREHAM, a town of Norfolk, 14 miles W. of Norwich.

DERELICTS, such lands as the sea, by receding from them, leaves dry and fit for cultivation. If they are left by a gradual recess of the sea, they are adjudged to belong to the owner of the adjoining lands; but when an island is formed in the sea, or a large quantity of new land appears, such derelict lands belong to the King.

DEREOUTE, or **DEIROUTE**, a town of Egypt between Cairo and Rosetta.

DERHAM, Dr. WILLIAM, a celebrated English philosopher and divine, born in 1657. In 1682, he was presented to the vicarage of Wargrave in Berkshire, and, in 1689, to the rectory of Upminster in Essex. Applying himself with great eagerness to natural and experimental philosophy, he soon became a distinguished member of the Royal Society, whose Philosophical Transactions contain a great variety of curious and valuable pieces, the fruits of his laudable industry. In his younger years he published his Artificial Clock-maker, which has been often printed; and in 1711, 1712, and 1714, he preached those sermons at Boyle's lecture, which he afterward digested under the well-known titles of Physico-Theology and Astro-Theology, and enriched with valuable notes and copper-plates. The last thing he published was Christo-Theology, a demonstration of the divine authority of the Christian religion, being the substance of a sermon preached at Bath in 1729. This great and good man, after spending his life in the most agreeable as well as improving study of nature, died at Upminster in 1735; and, besides many other works, left a valuable collection of curiosities, particularly specimens of birds and insects of this island. Dr. Derham was well skilled in medical as well as in physical knowledge; and was constantly a physician to the bodies as well as the souls of his parishioners.

DERIG, a small island, near the west coast of Ireland, and county of Sligo. Lon. 8. 24. W. Lat. 54. 55. N.

DERIVATIVE, in grammar, a word which takes its origin from another word, called its primitive. Thus the word derivative itself takes its origin from the primitive rivus, a rivulet or channel, out of which no less streams are drawn; and thus deity, manhood, lawyer, &c. are derived from deus, man, law, &c.

DERMESTES, a genus of insects of the order coleoptera. Antennæ clavate, the club perfoliate, three of the joints thicker; thorax convex, slightly margined; head inflected, and hidden under the thorax. Gmelin reckons about 90 species, in three sections. A. jaw bifid. B. jaw one-toothed. C. feelers four, clavate, the last joint larger. This genus consists principally of small insects. Their larvæ are found among skins, furs, and various animal substances of a dry kind, on which they live. They are exceedingly destructive to books, furniture, and collections of natural history. In the grub state they are of a lengthened oval shape, and hairy, especially towards the end of the body. The complete insect has the habit of withdrawing the head beneath the thorax when handled.

D. VIOLACEUS is a beautiful little insect: its elytra are of a deep violet blue. The thorax is covered with greenish hairs, the legs are black. The whole animal being of a glittering brilliancy renders it a pleasing object. The larvæ, as well as the perfect insect, inhabits the bodies of dead animals.

DERNE, a town of Africa, in Tripoli, near the sea-coast. Lon. 29. 45. E. Lat. 32. 55. N.

DEROGATORY CLAUSE, in a testament, is a certain sentence, cipher, or secret character, which the testator inserts in his will, and of which he reserves the knowledge to himself alone, add-

ing a condition, that no will he may make hereafter is to be reckoned valid, if this derogatory clause is not inserted expressly and word for word. It is a precaution invented by lawyers against latter wills extorted by violence, or obtained by suggestion.

DERP, a palatinate of Livonia.

DERP, the capital of the above palatinate. Lon. 26. 15. E. Lat. 58. 30. N.

DERRY, or **LONDONDERRY**, a town and county of Ireland, in Ulster. See **LONDONDERRY**.

DERVENTIO, in ancient geography, 1. a river of the Brigantes in Britain; now called Darwent, in Yorkshire: 2. a town of the Brigantes, seated on the river; now called Auldbly.

DERVIS, or **DERVICH**, a name given to a sort of monks among the Turks, who lead a very austere life, and profess extreme poverty; though they are allowed to marry. The word is originally Persian, درویش, signifying a beggar, or person who has nothing; and because the religious, and particularly the followers of Mevelava, profess not to possess any thing, they call both the religious in general, and the Mevelavites in particular, dervises.

DERVISES, EGYPTIAN, AND SYRIAN. There are in Egypt several kinds: those that are in convents, are in a manner of the religious order, and live retired; though there are of these some who travel and return again to their convents. Some take this character, and yet live with their families, and exercise their trades: of this kind are the dancing dervises at Damascus, who go once or twice a week to a little uninhabited convent, and perform their extraordinary exercises: these also seem to be a good people: but there is a third sort of them who travel about the country, and beg, or rather oblige people to give, for whenever they sound their horn something must be given them. The people of these orders, in Egypt, wear an octagonal badge, of a greenish white-alabaster, at their girdles, and a high stiff cap without any thing round it.

DERVISES, PERSIAN. The dervises in Persia, are called Abdals, *q. d.* servants of God. They lead a very penurious, austere life, and preach the Alcoran in the streets, coffee-houses, and wherever they can meet with auditors. The Persian dervises retail little but fables to the people, and are in the utmost contempt among the men of sense and letters.

DERVISES, TURKISH. The dervises called Mevelavites, are a Mohammedan order of religious; the chief or founder whereof was one Mevelava. They are now very numerous. Their chief monastery is that near Cogna in Natolia, where the general makes his residence, and where all the assemblies of the order are held; the other houses being all dependent on this, by a privilege granted to this monastery under Ottoman I. The dervises affect a great deal of modesty, patience, humility, and charity. They always go bare-legged and open-breasted, and frequently burn themselves with hot irons, to inure themselves to patience. They always fast on Wednesdays, eating nothing on those days till after sun-set. Tuesdays and Fridays they hold meetings, at which the superior presides. One of them plays all the while on a flute, and the rest dance, turning their bodies round and round with the greatest swiftness imaginable. Long custom to this exercise from their youth has brought them to such a habitude, that it does not discompose them at all. This practice they observe with great strictness, in memory of Mevelava their patriarch's turning miraculously round, as they pretend, for the space of four days without any food or refreshment; his companion Hamsa playing all the while on the flute: after which he fell into an extasy, and therein received wonderful revelations for the establishment of his order. They believe the flute an instrument consecrated by Jacob and the shepherds of the Old Testament, because they sang the praises of God upon them. They profess poverty, chastity, and obedience, and really observe them while they remain dervises; but if they choose to go out and marry, they are always allowed. The generality of dervises are mountebanks: some apply themselves to legerdemain, impostures, &c. to amuse the people; others pretend to sorcery and magic: but all of them, contrary to Mohammed's precept, are said to drink wine, brandy, and other strong liquors, to give them the degree of gaiety their order requires. Besides their great saint Mevelava, there are particular saints honoured in particular monasteries: as Kidereli, greatly revered in the monasteries of Egypt, and held by some to be St. George; and by others, with more probability, the prophet Elias. The dervises

are great travellers; and, under pretence of preaching, and propagating their faith, are continually passing from one place to another: on which account they have been frequently used as spies.

DERWENT, the name of four rivers of England: viz. 1. in Cumberland: 2. in Derbyshire: 3. in Durham: 4. in Yorkshire, rising in the N. Riding, and running S. falls into the Ouse below York.

DERWENT FELS, or DERWENT WATER FELS, a chain of mountains in Cumberland, reckoned among the loftiest in England.

DERWENT WATER, or the LAKE of KESWICK, a beautiful lake of Cumberland, in the vale of Keswick, lying between the mountain of Skiddaw on the N. and the craggy hills of Borrodale on the S. whence it derives its chief supplies of water. It is four miles long and above one broad.

DESAGULIERS, JOHN THEOPHILUS, F. R. S. the son of John Desaguliers, a French protestant refugee, was born at Rochelle in 1683. His father brought him to England an infant; and at a proper age placed him at Christ-church college, Oxford: where he succeeded Dr. Keil in reading lectures on experimental philosophy at Hart Hall. The magnificent duke of Chandos made Dr. Desaguliers his chaplain, and presented him to the living of Edgware, near his seat at Cannons; and he was afterwards chaplain to Frederic prince of Wales. He introduced the practice of reading public lectures on experimental philosophy, in London: and continued them with great success to the time of his death in 1749. He made several improvements in mechanics, and communicated many curious papers printed in the Philosophical Transactions; published a valuable "Course of Experimental Philosophy," in 2 vols, 4to; and gave an edition of "Gregory's Elements of Catoptrics and Dioptrics," with an Appendix on reflecting telescopes, 8vo. He was also a member of several foreign academies.

DESART, or DESERT, a large extent of country entirely barren, and producing nothing. In this sense some are sandy deserts; as those of Lop, Xamo, Arabia, and several others in Asia; in Africa, those of Libya and Zara: others are stony, as the desert of Pharan in Arabia Petrea.

DESCANT, in music, the art of composing in several parts. Descant is three-fold, viz. plain, figurative, and double.

1. **DESCANT, DOUBLE**, is when the parts are so contrived, that the treble, or any high part, may be made the bass; and, on the contrary, the bass the treble.

2. **DESCANT, FIGURATIVE or FLORID**, is that part of an air of music wherein some discords are concerned, as well, though not so much, as concords. This may be termed the ornamental and rhetorical part of music, in regard that there are introduced all the varieties of points, syncopes, diversities of measures, and whatever is capable of adorning the composition.

3. **DESCANT, PLAIN**, is the ground work and foundation of all musical compositions, consisting altogether in the orderly placing of many concords answering to simple counterpoint.

DESCENDANT, in genealogy, a term relative to ascendant, and applied to a person who is born or issued from some other referred to: thus mankind are said to be the descendants of Adam. See the article **DESCENT**.

DESCENSION, or DESCENDING, in general, signifies much the same with descent.

DESCENSION, in astronomy, is either right or oblique.

DESCENSION, RIGHT, is an arch of the equinoctial, intercepted between the vernal equinoctial point and the intersection of the meridian, passing through the centre of the object, at its setting, in a right sphere. See **ASTRONOMY**, and **ASCENSION**.

DESCENSION, OBLIQUE, an arch of the equinoctial intercepted between the vernal equinoctial point and the horizon, passing through the centre of the object, at its setting, in an oblique sphere. See **ASTRONOMY**, and **ASCENSION**.

DESCENSIONAL, something belonging to descension. See **DESCENSION**.

DESCENSIONAL DIFFERENCE, that between the right and oblique descension of any heavenly body. See **DESCENSION**.

DESCENT, in general, is the tendency of a body from a higher to a lower place; thus all bodies, unless otherwise determined by a force superior to their gravity, descend towards the centre of the earth: the planets too may be said to descend from the aphelion to the perihelion of their orbits, as the moon does from

the apogee to the perigee. Heavy bodies, meeting with no resistance descend with an uniformly accelerated motion. See **MECHANICS**, and **GRAVITY**.

DESCENT, in heraldry, is used to express the coming down of any thing from above: as, a lion en descent is a lion with his head towards the base points, and his heels towards one of the corners of the chief, as if he were leaping down from some high place.

DESCENT, or HEREDITARY SUCCESSION, in law, is the title whereby a man, on the death of his ancestor, acquires his estate by right of representation, as his heir at law. An heir, therefore, is he upon whom the law casts the estate immediately on the death of the ancestor: and an estate so descending to the heir is in law called the inheritance. See **INHERITANCE**. Descent is either lineal or collateral:

1. **DESCENT, COLLATERAL**, is that springing out of the side of the line or blood; as from a man to his brother, nephew, or the like. See **CONSANGUINITY**.

2. **DESCENT, LINEAL**, is that conveyed down in a right line from the grandfather to the father, from the father to the son, and from the son to the grandson, &c.

DESCENT of DIGNITIES. A dignity differs from common inheritances, and goes not according to the rules of the common law: for it descends to the half-blood; and there is no coparcenership in it, but the eldest takes the whole. The dignity of peerage is personal, annexed to the blood; and so inseparable, that it cannot be transferred to any person, nor surrendered even to the crown: it can move neither forward nor backward, but only downward to posterity; and nothing but corruption of blood, as if the ancestor be attainted of treason or felony, can hinder the descent to the right heir.

DESCENTS, in fortification, are the holes, vaults, and hollow places, made by undermining the ground. The descent into the moat or ditch is a deep passage made through the esplanade and covert-way, in form of a trench, whereof the upper part is covered with madders and clays, to secure the besiegers from the enemy's fire. In wet ditches this trench is on a level with the surface of the water, but in dry ones it is sunk as deep as the bottom of the ditch.

DESCRIBENT, in geometry, a line or surface, which, by moving parallel to itself, describes a surface or solid.

DESCRIPTION, in the modern fashionable dialect, is used as a substitute for sort or kind, and in this sense is applied both to persons and things.

DESCRIPTION, in literary composition, is such a strong and beautiful representation of a thing, as gives the readers a distinct view and satisfactory notion of it. See **NARRATION**.

DESCRIPTION. In deeds and grants there must be a certain description of the lands granted, the places where they lie, and the persons to whom granted, &c. to make them good. But wills are more favoured than grants as to those descriptions; and a wrong description of the person will not make a devise void, if there be otherwise a sufficient certainty, what person was intended by the testator. Where a first description of land, &c. is false, though the second be true, a deed will be void: contra, if the first be true and the second false.

DESEADA, DESIRADA, or DESIDERADA, the first of the Caribbee islands, discovered by Columbus in his second voyage, anno 1494, when he gave it that name. It is situated E. of Guadaloupe.

DESEADA, or CAPE DESIRE, the S. point of the Straits of Magellan.

DESEADEN, a town of Persia, in the province of Segestan, 30 miles S. S. E. of Kin.

DESENZANO, or DISSENZANO, a town of the late Cisalpine republic, 15 miles E. of Brescia.

DESERT ISLAND, MOUNT, an island of the United States, on the coast of the district of Maine.

DESERTER, in a military sense, a soldier who, by running away from his regiment or company, abandons the service. A deserter is, by the articles of war, punishable by death, and, after conviction, is hanged at the head of the regiment he formerly belonged to, with his crime writ on his breast, and suffered to hang till the army leave that camp, for a terror to others.

DESHACHE, in heraldry, is where a beast has its limbs separated from its body, so that they still remain on the escutcheon, with only a small separation from their natural places.

DESIDERATUM,

DESIDERATUM, [Lat.] somewhat which enquiry has not yet been able to settle or discover; as, the longitude is a desideratum of navigation. The trisection of an angle, and the quadrature of a circle, are desiderata of geometry.

DESIGN, signifies the plan, order, representation, or construction, of a building, book, painting, &c. See **ARCHITECTURE**, **HISTORY**, **ORATORY**, **PAINTING**, and **POETRY**.

DESIGN, in manufactures, expresses the figures wherewith the workman enriches his stuff or silk, and which he copies after some painter or eminent draughtsman, as in diaper, damask, and other flowered silk and tapestry, and the like. In the undertaking of such kinds of figured stuffs, it is necessary, says Mons. Savary, that, before the first stroke of the shuttle, the whole design be represented on the threads of the warp, we do not mean in colours, but with an infinite number of little packthreads, which being disposed so as to raise the threads of the warp, let the workmen see, from time to time, what kind of silk is to be put in the eye of the shuttle for woof. This method of preparing the work is called reading the design, and reading the figure, which is performed in the following manner: A paper is provided, considerably broader than the stuff, and of a length proportionate to what is intended to be represented thereon. This they divide lengthwise, by as many black lines as there are intended threads in the warp; and cross these lines, by others drawn breadthwise, which, with the former, make little equal squares; on the paper thus squared, the draughtsman designs his figures, and heightens them with colours as he sees fit. When the design is finished, a workman reads it, while another lays it on the simblot. To read the design, is to tell the person who manages the loom, the number of squares or threads comprised in the space he is reading, intimating at the same time, whether it is ground or figure. To put what is read on the simblot, is to fasten little strings to the several packthreads, which are to raise the threads named; and this they continue to do till the whole design is read. Every piece being composed of several repetitions of the same design, when the whole design is drawn, the drawer, to re-begin the design afresh, has nothing to do but to raise the little strings, with slip-knots, to the top of the simblot, which he had laid down to the bottom: this he is to repeat as often as is necessary till the whole is manufactured. The ribbon weavers have likewise a design, but far more simple than that now described. It is drawn on paper with lines and squares, representing the threads of the warp and woof. But instead of lines, whereof the figures of the former consist, these are constituted of points only, or dots, placed in certain of the little squares formed by the intersection of the lines. These points mark the threads of the warp that are to be raised, and the spaces left blank denote the threads that are to keep their situation: the rest is managed as in the former.

DESIGN, in music, is justly defined by Rousseau to be the invention and the conduct of the subject, the disposition of every part, and the general order of the whole. It is in a distribution formed with intelligence and taste, in a just proportion between all the parts, that the perfection of design consists; and it is above all, in this point, that the immortal Pergolesi has shewn his judgement and his taste, and has left so far behind him all his competitors. His *Stabat Mater*, his *Orseo*, his *Serva Padrona*, are, in three different species of composition, three masterpieces of design equally perfect. This idea of the general design of a work is likewise particularly applicable to every piece of which it consists; thus the composer plans an air, a duett, a chorus, &c. For this purpose, after having invented his subject, he distributes it, according to the rules of a legitimate modulation, into all the parts where it ought to be perceived, in such a proportion, that its impression may not be lost on the minds of the audience; yet that it may never be reiterated in their ears, without the graces of novelty. The composer errs in designing who suffers his subject to be forgot; he is still more culpable who pursues it till it becomes trite and tiresome.

DESIGN is particularly used, in painting, for the first idea of a large work, drawn roughly, and in little, with an intention to be executed and finished in large. In this sense, it is the simple contour or outlines of the figures intended to be represented, or the lines that terminate and circumscribe them: such design is sometimes drawn in crayons or ink, without any shadows at all; sometimes it is hatched, that is, the shadows are expressed by sensible

outlines, usually drawn across each other with the pen, crayon, or graver.

DESIGNATOR OF AN ESTATE is made by the tenants, butments, and boundings. Among the Romans, there were designations of the consuls and other magistrates, some time before their elections.

DESIGNATOR, a Roman officer, who assigned and marked each person his place and rank in public ceremonies, shews, processions, &c. He was a kind of master of the ceremonies, who regulated the seats, march, order, &c.

DESIGNING, the art of delineating or drawing the appearance of natural objects, by lines, on a plane. To design, according to the rules of mathematics, makes the object of true perspective. See **PERSPECTIVE**.

DESOLATION. See **KERGUELEN'S LAND**.

DESPOT, [*despotes*], an absolute prince; one that governs with unlimited authority. Despot originally signified the same with *herus*, a master: but in time it underwent the same fate on medals as, among the Romans, Cæsar did with regard to Augustus; *BACIAEYC*, king, answering to Augustus, and *ΔΕCΙOTHC*, despot, to Cæsar. Thus, Nicephorus having ordered his son Stauracius to be crowned, the son, out of respect would only take the name *ΔΕCΙOTHC*, leaving to his father that of *BACIAEYC*. The following emperors however, preferred the quality of *ΔΕCΙOTHC* to that of *BACIAEYC*; particularly Constantine XII. Michael Ducas, Romanus Diogenes, Nicephorus Botoniates, the Comneni, and some others. In imitation of the princes, the princesses likewise assumed the title of *ΔΕCΙOINA*. It was the emperor Alexius Angelus that created the dignity of despot, and made it the first after that of emperor, or Augustus, above those of Sebastocrator and Cæsar. Despot is at present a title of quality given to the princes of Wallachia, Servia, and some of the neighbouring countries.

DESPOTISM is particularly used for an arbitrary government, where the power of the prince is unlimited, and his will a law to his subjects: such are those of Turkey, Persia, and most of the eastern governments; and even those of Europe, if we except our own government.

DESPOUILLE, in heraldry, the whole case, skin, or slough of a beast, with the head, feet, tail, and all appurtenances, so that being filled and stuffed it looks like the entire creature.

DESSAU, or **DESSAW**, a strong town of Germany, in Upper Saxony, 37 miles N. of Leipsic.

DESTINIES, in mythology. See **PARCÆ**.

DESTRUCTION, an alteration of any thing from its natural state, to one contrary to nature; whereby it is deemed the same with corruption.

DESTRUCTION, **CHEMICAL**, or **CORRUPTION**, is nothing but a resolution of the whole naturally mixt body into its parts.

DESULTOR, in antiquity, a vaulter or leaper, who, leading one horse by the bridle, and riding another jumped from the back of the one to the other, as the custom was, after they had run several courses or heats. This practice required great dexterity, being performed before the use of either saddles or stirrups.

DETACHED PIECES, in fortification, are such out-works as are detached, or at a distance from the body of the place; as demilunes, ravelines, bastions, &c. In painting, the figures are said to be well detached, when they stand free and disengaged from each other.

DETACHMENT, in military affairs, a certain number of soldiers drawn out from several regiments or companies equally, to be employed as the general thinks proper, whether on an attack, at a siege, or in parties to scour the country. A detachment of two or three thousand men, is a command for a brigadier; eight hundred, for a colonel; four or five hundred, for a lieutenant-colonel. A captain never marches on a detachment with less than fifty men, a lieutenant, an ensign, and two sergeants. A lieutenant is allowed thirty, and a serjeant; and a serjeant ten or twelve men. Detachments are sometimes made of intire squadrons and battalions.

DETAINDER, the name of a writ for holding one in custody.

DETENTS, in a clock, are those stops which, by being lifted up or let fall down, lock and unlock the clock in striking.

DETENT WHEEL, or **HOOP WHEEL**, in a clock, a wheel which has a hoop almost round it, wherein there is a vacancy, at which the clock locks.

DETERGENTS,

DETERGENTS, in pharmacy, such medicines as are not only softening and adhesive, but also, by a peculiar activity, conjoined with a suitable configuration of parts, are apt to abrade and carry along with them such particles as they lay hold on in their passage.

DETERMINATE PROBLEM, in geometry, that which has but one, or at least, a limited number of answers: as the following problem, which has but one only solution, viz. To describe an isosceles triangle on a given line, whose angles at the base shall be double that at the vertex. But the following hath two solutions, viz. To find an isosceles triangle, whose area and perimeter are given. A determinate problem may be either simple, linear, plain, solid, &c.

DETERMINATION, among divines, is an act of divine power, limiting the agency of second causes, in every instance, to what the Deity predestinated concerning them. See **PREDESTINATION**.

DETERMINATION, in mechanics, signifies much the same with tendency or direction of a body in motion. See **MECHANICS**.

DETERSIVE, an application that has the power of cleansing wounds.

DETHMOLD, or **DETMOLD**, a town of Germany, in Westphalia, 25 miles S. S. W. of Minden.

DETINUE, [*detenue*, Fr.] a writ that lies against him, who, having goods or chattels delivered him to keep, refuses to deliver them again.

DETINUE lies for any thing certain and valuable, wherein one may have a property or right; as for a horse, cow, sheep, hens, dogs, jewels, plate, cloth, bags of money, sacks of corn, &c. It must be laid so certain, that the thing detained may be known and recovered; and therefore, for money out of a bag, or corn out of a sack, &c. it lies not; for the money or corn cannot, in this case, be known from other money or corn; so that the party must have an action on the case, &c. Yet *detinue* may be brought for a piece of gold of the price of 22s. though not for 22s. in money. In this action, the thing detained is generally to be recovered, and not damages; but if one cannot recover the thing itself, he shall recover damages for the thing, and also for the detainer. In order, therefore, to ground an action of *detinue*, which is only for the detaining, these points are necessary: 1. That the defendant came lawfully by the goods, as either by delivery to him, or finding them. 2. That the plaintiff have a property. 3. That the goods themselves be of value. And 4. That they be ascertained in point of identity. Upon this, the jury, if they find for the plaintiff, assess the respective values of the several parcels detained, and also damages for the detention, and the judgement is conditional, that the plaintiff recover the said goods, or (if they cannot be had) their respective values, and also the damages for detaining them.

DETONATION, [*detono*, Lat] in chemistry, an explosion with noise, made by the inflammation of a combustible body. *Decrepitation* differs from *detonation* only as producing a fainter noise, or merely a kind of crackling sound peculiar to certain salts. *Fulmination* is a more quick and lively *detonation*, such as takes place with certain preparations of gold, silver, mercury, &c.

DETRANCHE, in heraldry, a line bend-wise, proceeding always from the dexter side, but not from the very angle diagonally athwart the shield.

D'ETROIT, or **D'ETROIT FORT**, one of the principal towns, and best fortified, in the north-western territory of the United States: situated on the W. bank of the D'Etoit, 78 miles N. of Lake Erie.

D'ETROIT RIVER, or **STRAIT OF ST. CLAIR**, flows from lake St. Clair into the W. end of lake Erie, forming part of the boundary between the United States, and Upper Canada.

DEVA, a sea-port town of Spain, 15 miles W. of St. Sebastian.

DEUCALION, king of Thessaly. The flood said to have happened in his time, about B. C. 1500, is supposed to have been only an inundation of that country, occasioned by heavy rains, and an earthquake that stopped the course of the river Peneus, where it usually discharged itself into the sea. According to the mythology, he was the son of Prometheus. He governed his people with equity; but the rest of mankind being extremely wicked, were destroyed by a flood, while Deucalion, and Pyrrha his queen, saved themselves by ascending mount Parnassus. When

the waters were decreased, they went and consulted the oracle of Themis, on the means by which the earth was to be re-peopled; when they were ordered to veil their heads and faces, to unloose their girdles, and throw behind their backs the bones of their great mother. At this advice Pyrrha was seized with horror; but Deucalion explained the mystery, by observing, that their great mother must mean the earth, and her bones the stones; when taking them up, those Deucalion threw over his head became men, and those thrown by Pyrrha women. Dr. Bryant and others have supposed, that Deucalion was the same with the patriarch Noah; and that his flood in Thessaly, as well as that of Ogyges in Attica, and of Prometheus in Egypt, were the same with that of Noah recorded in Scripture.

DEVENSHRING. See **DEVONSHEERING**.

DEVENTER, a large, strong, trading, and populous town of Holland, 50 miles E. of Amsterdam.

DEVICE, among painters. See **DEVISE**.

DEVICOTTA, a town of India, in the Carnatic, 20 miles N. of Tranquebar.

DEVIL, an evil angel, one of those celestial spirits cast down from heaven, for pretending to equal himself with God. The Ethiopians paint the devil white, to be even with the Europeans, who paint him black. There is no mention of the word devil in the Old Testament, but only of the words Satan and Belial; nor do we meet with it in any heathen authors, in the sense it is taken among Christians, that is, as a creature revolted from God. Their theology went no farther than to evil genii or demons. See **DÆMON**, and **DÆMONTAC**. Some of the American idolaters have a notion of two collateral independent beings, one of whom is good, and the other evil; which last they imagine has the direction and superintendence of this earth, for which reason they chiefly worship him; whence those that give us an account of the religion of these savages give out, that they worship the devil. The Chaldeans and Persians, in like manner, believed both a good principle and an evil one; which last they imagined was an enemy to mankind. Isaiah, speaking according to some commentators, of the fall of the devil, calls him Lucifer, from his former elevation and state of glory: but others explain this passage of Isaiah in reference to the king of Babylon, who had been precipitated from his throne and glory. The Arabians call Lucifer Eblis; which some think is only a diminutive, or corruption of the word Diabolus.

DEVIL ON THE NECK, a tormenting engine made of iron, straitening and wincing the neck of a man, with his legs together, in a horrible manner; so that the more he stirs in it, the straiter it presses him; formerly used by the persecuting papists.

DEVIL'S ARSE-A-PEAK, a great unfathomable hole or cavern in Derbyshire.

DEVILS BIT, in botany. See **SCABIOSA**.

DEVISE, or **DEVICE**, in heraldry, painting, and sculpture, an emblem used to represent a certain family, person, action, or quality; with a suitable motto, applied in a figurative sense. See **MOTTO**. The essence of a device consists in metaphorical similitude between the things representing and represented: thus, a young nobleman, of great courage and ambition, is said to have borne his devise, in a carousal at the court of France, a rocket mounted in the air, with this motto in Italian, "proco duri purehe m'inalzi;" expressing, that he preferred a short life; provided he might thereby attain to glory and eminence.

DEVISE, in law, the act whereby a person bequeaths his lands or tenements to another, by his last will and testament. The person who makes this act, is called the *devisor*, and he in whose favour the act is made, is termed in law the *devisee*.

DEVIZES, a populous borough of Wiltshire, 19 miles E. of Bath.

DEVON, a river of Scotland, in the counties of Perth and Clackmannan.

DEVONSHEERING, the burning of land by way of manure. The method is to cut off the turf about four inches thick, and burn it in heaps, and then spread the ashes upon the land.

DEVONSHIRE, a county of England, bounded on the S. and S. E. by the English channel, on the N. and N. W. by the Bristol channel, on the E. by Somersetshire and Dorsetshire, and on the W. by Cornwall. It is about 69 miles long from N. to S. and 64 broad. The soil is various; in the western parts it is coarse.

coarse and moorish, bad for sheep, but proper for black cattle. Its chief rivers are the Dart, the Ex, the Tamar, and the Teigne.

DEVOTION is defined by Jurieu, a softening and yielding of the heart, with an internal consolation, which the souls of believers feel in the exercise of piety. It also includes certain religious practices, which a person makes it a rule to discharge regularly; and with reason, if these be founded on solid piety; otherwise they are mere superstition. That devotion is vain, which we would accommodate both to God and to the world. The character of devotion has frequently suffered from the forbidding air which has been thrown over it, by bigotry and superstition. When freer and more cheerful minds have not had occasion to see it accompanied with those feelings of delight and benevolence which naturally attend it, they are apt to be prejudiced against piety, by mistaking this ungracious appearance for its genuine form. Wherever the vital spirit of Christian devotion, founded on genuine faith in Christ, prevails, its immediate objects will be to adore the perfections of God; to entertain with reverence and complacency the various intimations of his pleasure, especially those contained in holy writ; to acknowledge our absolute dependence, and infinite obligations to him; to confess and lament the disorders of our nature, and the transgressions of our lives; to implore his grace and mercy through Jesus Christ; to intercede for our brethren of mankind; to pray for the propagation and establishment of truth, righteousness, and peace, on earth; in fine, to long for a more entire conformity to the will of God, and to breathe after the everlasting enjoyment of his friendship. The effects of such a spirit habitually cherished, and feelingly expressed before him, must surely be important and happy. Among these may be reckoned, a profound humility in the sight of God, a high veneration for his presence and attributes, an ardent zeal for his worship and honour, a constant imitation of our Saviour's divine example, a diffusive charity for men of all denominations, a generous and unwaried self-denial for the sake of virtue and society, a total resignation to Providence, an increasing esteem for the gospel, with clearer and firmer hopes of that immortal life which it has brought to light.

DEVOTION, or **BEING DEVOTED**, among the ancient Romans, was a kind of sacrifice or ceremony, whereby they consecrated themselves to the service of some person. The ancients had a notion, that the life of one might be ransomed by the death of another; whence those devotions became frequent for the lives of the emperors.

DEVOURING, in heraldry, is when fishes are borne in an escutcheon in a feeding posture, for they swallow all the meat whole.

DEUTERO-CANONICAL, [from *deuteros*, second, and *kanonikos*, canonical,] in the school theology, an appellation given to certain books of holy scripture, which were added to the canon after the rest; either because they were not wrote till after the compilation of the canon, or by reason of some dispute as to their canonicalness. The Jews acknowledged several books in their canon, which were put there later than the rest. They say, that under Ezra, a great assembly of their doctors, which they call by way of eminence the great synagogue, made the collection of the sacred books which we now have in the Hebrew Old Testament. And they agree that they put books therein which had not been so before the Babylonish captivity; such are those of Ezra, Nehemiah, Esther, Ezekiel, Daniel, Haggai, Zechariah, and Malachi. The Latin church has since added others to the canon, that were not, and could not be, in the canon of the Jews; being wrote long after. Such are several of the apocryphal books, as the Maccabees, Ecclesiasticus, Wisdom, &c. Others were added still later, by reason their canonicalness had not been previously examined. The deuterocanonical books in the modern canon, are the epistle to the Hebrews; those of James, and Jude; the second of St. Peter; the second and third of St. John; and the Revelation.

DEUTERONOMY, [*deuteros*, Gr. second, and *nomos*, law,] one of the sacred books of the Old Testament, was the last of those written by Moses. See **PENTATEUCH**. It was written in the 40th year after the delivery from Egypt, in the country of the Moabites beyond Jordan; Moses being then in the 120th year of his age.

VOL. II.—NO. 64.

DEUTEROPOTMI, in Grecian antiquity, a designation given to such of the Athenians as had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered.

DEUTEROSIS, [*deuteros*,] the Greek name by which the Jews called their Mischnah, or second law. See **MISCHNAH**.

DEUTZIA, in botany, a genus of the decandria trigynia class and order. Calyx one-leaved; capsule three-celled; filaments three-cusped. There is only one species, a native of Japan.

DEUX PONTS, a late duchy of Germany, in the circle of the Upper Rhine, annexed to the French republic, in December 1797.

DEUX PONTS, or **ZWEYBRUCKEN**, (as the Germans call it,) a town of Germany, now annexed to France, and included in the department of Sarre and Moselle. It is 46 miles W. of Mannheim.

DEW, [*deaw*, Sax. *daaw*, Dut.] a dense, moist vapour, found on the earth in spring and summer mornings in form of a misting rain, being collected there chiefly while the sun is below the horizon. Dr. Hutton defines it to be "a thin light insensible mist, or rain, ascending with a slow motion, and falling while the sun is below the horizon." He adds, "that it appears to differ from rain, as less from more. Its origin and matter are doubtless from the vapours and exhalations that rise from the earth and water." See **METEOROLOGY**.

DEW-BORN, in country affairs, a distemper in cattle, being a swelling in the body, as much as the skin can hold, so that some beasts are in danger of bursting. It proceeds from greediness in feeding, when put into a rank pasture; but commonly when the grass is full of water. In this case the beast should be stirred up and down, and made to purge well; but the proper cure is bleeding in the tail; then take a grated nutmeg, with an egg, and breaking the top of the shell, put out so much of the white as you may have room to slip the nutmeg into the shell; mix them together, and then let shell and all be put down the beast's throat; that done, walk him up and down, and he will soon mend.

DEXTANS, in Roman antiquity, ten ounces, or ten-twelfths of their libra. See **LIBRA**.

DEXTER, in heraldry, an appellation given to whatever belongs to the right side of a shield or coat of arms: thus we say, bend dexter, dexter point, &c.

DEXTROCHERE, or **DESTROHERE**, in heraldry, is applied to the right arm painted in a shield, sometimes naked; sometimes clothed, or adorned with a bracelet; and sometimes armed, or holding some moveable or member used in the arms.

DEY, the title of the sovereign of Algiers, under the protection of the grand seignor. A prince under this title was appointed by the sultan, at the request of the Turkish soldiers, in 1710. The term dey, in the Turkish language, signifies an uncle by the mother's side; and the reason of the denomination is this: that the Turkish military consider the grand seignor as their father; the state as their mother, by which they are nourished and maintained; and the dey as the brother of the state, and consequently the uncle of all who are under his dominion.

DEZKAK, a town of Persia, in the province of Segestan, 110 miles E. N. E. of Zareng.

DHAR, a town of Hindostan, in the country of Malwa, 42 miles W. of Indore.

DHOOLPOUR, a town of Hindostan, in the country of Agra, 32 miles S. of Agra.

DIABETES, [*διαβητης*,] a morbid copiousness of urine. See **MEDICINE**.

DIACAUSTIC CURVE, a species of the caustic curves formed by refraction. Thus if you imagine an infinite number of rays BA, BM, BD, &c. (Plate LIV. fig. 9,) issuing from the same luminous point B to be refracted to or from the perpendicular MC by the given curve AMD, and so that CE, the sines of the angles of incidence CME, be always to CG, the sines of the refracted angles CMG, in a given ratio; then the curve HFN, which touches all the refracted rays, is called the diacaustic, or caustic refraction. See **CAUSTIC CURVE**.

DIACHYLON, in pharmacy, an emollient digestive plaster composed of mucilages or viscid juices drawn from certain plants. See **PHARMACY**.

DIACODIUM, [*διακωδιον*,] the syrup of poppies.

2 N

DIACODIUM

DIACODIUM is also called *syrupus de meconio*. See **PHARMACY**.

DIACOUSTICS, or **DIAPHONICS**, the consideration of the properties of refracted sound, as it passes through different mediums. See **ACOUSTICS**. The word is formed from the Greek *δια*, per, through, which intimates a passage; and *ακουω*, I hear, *q. d.* the consideration of the passage of the sounds we hear.

DIACRII, in antiquity, the name of a faction at Athens. That city was divided into two parties. the one wished for an oligarchy, and would only have a few persons employed in the government; the others were for democratical government, wherein the whole people should have a share. The first were called diacrii, and the latter pediacy; the latter inhabiting the lower, and the former the *ακρον*, or upper part of the city.

DIADELPHIA, [from *δισ*, twice, and *αδελφος*, a brother,] the 17th class in the sexual system, comprehending those plants which bear hermaphrodite flowers with two sets of united stamina; but this circumstance must not be absolutely depended on. They are the papilionacei of Tournefort, the irregulares tetrapetali of Rivinus, and the leguminosa of Ray. See **BOTANY**.

DIADEM, in antiquity, was a head-band or fillet, worn by kings as a badge of their royalty. It was made of silk, thread, or wool, and tied round the temples and forehead, the ends being tied behind, and let fall on the neck. It was usually white, and quite plain; though sometimes embroidered with gold, and set with pearls and precious stones. In latter times, it came to be twisted round crowns, laurels, &c. and even appears to have been worn on divers parts of the body. See **CROWN**. The word is derived from the Greek verb, *διαδω*, to gird.

DIADEM, in heraldry, is applied to certain circles or rims serving to inclose the crowns of sovereign princes, and to bear the globe and cross, or the flower de lices, for their crest. The crowns of sovereigns are bound, some with a greater, and some with a less number of diadems. The bandage about the heads of Moors on shields is also called diadem, in blazoning.

DIERESIS, [*διαίρεσις*,] the separation or disjunction of syllables: as *aër*, *πληρώδης*, *Δι*, *Αἰὺλ*.

DIERESIS, in medicine, is the consuming of the vessels of an animal body, when from some corroding cause certain passages are made, which naturally ought not to have been; or certain natural passages are dilated beyond their ordinary dimensions, so that the humours which ought to have been contained in the vessels extravasate or run out.

DIERESIS, in surgery, an operation serving to divide and separate the part when the continuity is a hindrance to the cure.

DIÆRETICS, corrosive medicines.

DIETETÆ, in Grecian antiquity, a kind of judges, of which there were two sorts; viz.

1. **DIETETÆ CLEROTI**, public arbitrators, chosen by lot to determine all causes exceeding ten drachms, within their own tribe, and from their sentence an appeal lay to the superior courts.

2. **DIETETÆ DIALLECTERII**, private arbitrators from whose sentence there lay no appeal. They always took an oath to administer justice without partiality.

DIETETICS, that branch of medicine which relates to the rules respecting food. See **MEDICINE**.

DIAGLYPHICE, the art of cutting or engraving figures on metals, such as seals, intaglios, matrices of letters, &c. or coins for medals. See **ENGRAVING**.

DIAGNOSIS, [from *διαγιγνωσκω*, Gr. to distinguish,] the diagnostics or signs of a disease. See next article.

DIAGNOSTIC, [*διαγνωστικω*,] a symptom by which a disease is distinguished from others.

DIAGNOSTICS, are of two kinds; viz.

1. **DIAGNOSTICS, ADJUNCT**, are common to several diseases, and serve only to point out the difference between diseases of the same species.

2. **DIAGNOSTICS, PATHOGNOMONIC**, are those which always attend the disease, and distinguish it from all others.

DIAGONAL, [*διαγωνιω*,] in geometry, a right line drawn across a quadrilateral figure, from one angle to another; by some called the diameter, and by others the diametral, of the figure. See **GEOMETRY**.

DIAGORAS, surnamed the Atheist, lived in the 91st Olympiad. He was not a native of Athens, but he philosophised there. He delighted in making verses, and had composed a poem which a certain poet stole from him. He sued the thief, who swore it was his own, and got glory by it. This tempted Diagoras to deny a Providence. The Athenians summoned him to give an account of his doctrine. He fled, and they set a price upon his head, promising a reward to any who should kill him; but he took shipping, and was cast away.

DIAGRAM, [*διαγραμμα*,] a delineation of geometrical figures; a mathematical scheme.

DIAH, or **DIAT**, a name given by the Arabs to the punishment of retaliation. By the Mohammedan law, a brother, or the next relation of a murdered person, ought to take part against the murderer, and demand his blood in reparation for the murder.

DIAHEXAPLA, or **DIAHEXAPLE**, among farriers, a compound medicine, so called from its containing six ingredients, viz. birthwort and gentian roots, juniper berries, bay berries, myrrh, and ivory shavings. It is commended for colds, consumptions, purness, and many other disorders in horses.

DIAL, [from the Latin, *dies*, day, because it indicates the hour of the day,] the ancients also called it *Sciatherium*, from its effect by the shadow. See **DIALING**.

DIALECT, [*διαλεκτω*,] the subdivision of a language; as the Attic, Doric, Ionic, Æolic dialects.

DIALECT is an appellation given to the language of a province, in so far as it differs from that of the whole kingdom. The term is particularly used in speaking of the ancient Greek, whereof there are four dialects; each of which was a perfect language in its kind, that took place in certain countries, and had peculiar beauties. In Great Britain, besides the two grand dialects of English and Scotch, almost every county has a dialect of its own, all differing considerably in pronunciation, accent, and tone, although one and the same language.

DIALECTIC, [*ἡ διαλεκτικὴ τέχνη*,] logic; the act of reasoning.

DIALECTICS, in the literary history of the ancients, that branch of logic which taught the rules and modes of reasoning. See the article **LOGIC**. Zeno Eleates was the first who discovered the natural series of principles and conclusions observed in reasoning, and formed an art thereof in form of a dialogue; which, for this reason, was called dialectica. The dialectica of the ancients is usually divided into several kinds: 1. The first was the eleatica, that of Zeno Eleates, which was threefold; viz. consecutionem, colloquutionum, and contentionum: the first consisting of rules for deducing or drawing conclusions. The second, the art of dialogue; which became of such universal use in philosophy, that all reasoning was called interrogation: then, syllogism being laid aside, the philosophers did all by dialogue; it lying on the respondent to conclude and argue from the several concessions made. The last part of Zeno's dialectics, *ἐριστικη*, was contentious, or the art of disputing and contradicting; though some, particularly Laertius, ascribe this part to Protagoras a disciple of Zeno. 2. The second is the dialectica megarica, whose author is Euclid, not the mathematician, but another of Megara. He gave much into the method of Zeno and Protagoras; though there are two things appropriated to him: the first, that he impugned the demonstrations of others, not by assumptions, but conclusions; continually making illations, a proceeding from consequence to consequence: the second, that he set aside all arguments drawn from comparisons of similitude as invalid. He was succeeded by Eubulides, from whom the sophistic way of reasoning is said to be derived. In his time the art is described as manifold: mentions, fallens, electra, obvelata, arcevalis, cornuta, and calva. See **SOPHISM**. 3. The third is the dialectics of Plato, which he proposes as a kind of analysis to direct the human mind, by dividing, defining, and bringing things to the first truth; where being arrived, and stopped there a little, it applies itself to explain sensible things, but with a view to return to the first truth where alone it can rest. Such is the idea of Plato's analysis. 4. The fourth is Aristotle's dialectics; containing the doctrine of simple words, delivered in his book "De Interpretatione;" and that of the several kinds of syllogism, in his books of *Analytics*, *Topics*, and *Elenchuses*. 5. The fifth is the dialectics of the Stoics; which they call a part of philosophy, and divide into rhetoric and dialectic; to which some add the definitive, whereby things are justly defined; comprehending likewise the canons or criterions of

of truth. The Stoics, before they treat of syllogisms, have two principal places; the one about the signification of words, the other about the things signified. 6. The sixth is Epicurus's dialectics; for though he seems to have despised dialectic, he cultivated it with vigour. He was only averse to that of the Stoics; who he thought attributed too much to it, as pronouncing him alone wise who was well versed in dialectics. For this reason, Epicurus, seeming to set aside the common dialectics, had recourse to another way; viz. to certain canons which he substituted in their stead, the collection whereof he called canonica; and all questions in philosophy are either *de re* or *de voce*, he gave separate rules for each.

DIALITHA, in the writings of the ancients, a word used to express the elegant ornaments of the Greeks and Romans, composed of gold and gems. They also called these Lithocolia, *q. d.* cemented stones or gems; the gold being in this case as a cement to hold the stones together.

DIALIUM, in botany, a genus of the monogynia order, and diandria class of plants. Corolla regular, pentapetalous; no calyx; stamina at the upper side of the receptacle. It has but one species, a native of the East Indies.

DIALLAGA, [*Διαλλαγή*, Gr.] in rhetoric, a figure, wherein many arguments are adduced, but none of them conclusive.

DIALING.

The art of drawing dials upon any given surface, whether plane or curved. This art is of great antiquity, for we read in Isaiah xxxviii. 8, of the dial of Ahaz who began to reign 400 years before Alexander, and within 12 years of the building of Rome. Among the ancients Anaximenes the Milesian, and Thales, are said to have made dials, and Vitruvius mentions one made by the ancient Chaldee historian Berosus, on a reclining plane almost parallel to the equator. Aristarchus of Samos invented the hemispherical dial, and there were at the same time some spherical ones, with a needle for a gnomon. The discus of Aristarchus was an horizontal dial with its rim raised up all around to prevent the shadow from stretching too far. The first sun-dial at Rome was set up by Papirius Cursor, about A. U. C. 460; before which time says Pliny there is no mention of any account of time but by the sun's rising and setting: it was set up at or near the temple of Quirinus, but was very inaccurate. About 30 years after, M. Valerius Messala, being consul, brought out of Sicily another dial, which he set up on a pillar near the rostrum; but because it was not made for the latitude, it did not shew the time truly. They made use of it 99 years; till Martius Philippus set up another more exact. The first professed writer on dialing is Clavius; who demonstrates both the theory and the operations, after the rigid manner of the ancient mathematicians; but with so much intricacy, that few perhaps ever read them all. Dechaes and Ozanam give much easier demonstrations in their "Courses," and Wolfius in his "Elements." M. Picard has given a new method of making large dials, by calculating the hour-lines; and M. de la Hire, in his "Dialing," printed in 1683, a geometrical method of drawing hour-lines from certain points determined by observation. Eberhardus Welperus, in 1625, published his "Dialing," wherein he lays down a method of drawing the primary dials on a very easy foundation. The same foundation is described at length by Sebastian Munster, in his "Rudimenta Mathematica," published in 1551. Stermius, in 1672, published a new edition of Welperus's "Dialing," with the addition of a whole second part, about inclining and declining dials, &c. In 1708, the same work, with Sturm's addition, was republished with the addition of a fourth part, containing Picard's and de la Hire's methods of drawing large dials. Paterson, Michael, and Muller, have each wrote on dialing, in the German tongue; Coetsius in his "Horologigraphia Plana," printed in 1689; Gauppenius, in his "Gnomonica Mechanica;" Bion, in his "Use of Mathematical Instruments;" the late ingenious Mr. Ferguson, in his "Select Lectures;" Mr. Emerson, in his "Dialing;" and Mr. W. Jones, in his "Instrumental Dialing." Mr. Ferguson having treated this subject in a clear and satisfactory manner, we shall make liberal use of his "Lecture on Dialing."

DEFINITIONS.

1. A dial is a surface, which is generally plane, upon which lines are described in such a manner, that the shadow of a wire, or of the upper edge of another plane, erected perpendicularly on the former, may shew the true time of the day.
2. The edge of the plane by which the time of the day is found, is called the style of the dial, which must be parallel to the earth's axis; and the line on which the said plane is erected, is called the substile.

3. The angle included between the substile and stile, is called the elevation or height of the stile.

4. Those dials whose planes are parallel to the plane of the horizon, are called horizontal dials; and those dials whose planes are perpendicular to the plane of the horizon, are called vertical or erect dials.

5. Those erect dials, whose planes directly front the north or south, are called direct north or south dials; and all other erect dials are called decliners, because their planes are turned away from the north or south.

6. Those dials whose planes are neither parallel nor perpendicular to the plane of the horizon, are called inclining or reclining dials, according as their planes make acute or obtuse angles with the horizon; and if their planes are also turned aside from facing the south or north, they are called declining inclining or declining reclining dials.

7. The intersection of the plane of the dial, with that of the meridian, passing through the stile, is called the meridian of the dial, or the hour-line of XII.

8. Those meridians, whose planes pass through the stile, and make angles of 15, 30, 45, 60, 75, and 90 degrees with the meridian of the place (which marks the hour-line of XII.) are called hour-circles; and their intersections with the plane of the dial are called hour-lines.

9. In all declining dials, the substile makes an angle with the hour-line of XII. and this angle is called the distance of the substile from the meridian.

10. The declining plane's difference of longitude, is the angle formed at the intersection of the stile and plane of the dial, by two meridians: one of which passes through the hour-line of XII. and the other through the substile.

ILLUSTRATION OF THE PRINCIPLES OF DIALING. See Plate LVI.

If the whole earth *a P e p*, (fig. 1,) were transparent, and hollow, like a sphere of glass, and had its equator divided into 24 equal parts by so many meridian semicircles, *a, b, c, d, e, f, g*, &c. one of which is the geographical meridian of any given place, as London, (which is supposed to be at the point *a*;) and if the hours of XII. were marked at the equator, both upon that meridian and the opposite one, and all the rest of the hours in order on the rest of the meridians, those meridians would be the hour-circles of London: then, if the sphere had an opaque axis, as *P E p*, terminating in the poles *P* and *p*, the shadow of the axis would fall upon every particular meridian and hour, when the sun came to the plane of the opposite meridian, and would consequently shew the time at London, and at all other places on the meridian of London. If this sphere were cut through the middle by a solid plane *ABCD*, in the rational horizon of London, one-half of the axis *EP* would be above the plane, and the other half below it; and if straight lines were drawn from the centre of the plane to those points where its circumference is cut by the hour-circles of the sphere, those lines would be the hour-lines of a horizontal dial for London: for the shadow of the axis would fall upon each particular hour-line of the dial, when it fell upon the like hour-circle of the sphere. If the plane which cuts the sphere be upright, as *AFCG*, (fig. 2,) touching the given place (London) at *F*, and directly

directly facing the meridian of London, it will then become the plane of an erect direct south dial: and if right lines be drawn from its centre *E* to those points of its circumference where the hour-circles of the sphere cut it, these will be the hour-lines of a vertical or direct south dial for London, to which the hours are to be set as in the figure, (contrary to those on a horizontal dial,) and the lower half *Ep* of the axis will cast a shadow on the hour of the day in this dial, at the same time that it would fall upon the like hour-circle of the sphere, if the dial plane was not in the way. If the plane (still facing the meridian) be made to incline, or recline, any given number of degrees, the hour-circles of the sphere will still cut the edge of the plane in those points to which the hour-lines must be drawn straight from the centre; and the axis of the sphere will cast a shadow on these lines at the respective hours. The like will still hold, if the plane be made to decline by any given number of degrees from the meridian toward the east or west: provided the declination be less than 90 degrees, or the reclination be less than the co-latitude of the place: and the axis of the sphere will be a gnomon, or stile, for the dial. But it cannot be a gnomon, when the declination is quite 90 degrees, nor when the reclination is equal to the co-latitude: because, in these two cases, the axis has no elevation above the plane of the dial. And thus it appears, that the plane of every dial represents the plane of some great circle upon the earth; and the gnomon the earth's axis, whether it be a small wire as in the above figures, or the edge of a thin plate, as in the common horizontal dials. The whole earth, as to its bulk, is but a point, if compared to its distance from the sun: and therefore, if a small sphere of glass be placed upon any part of the earth's surface, so that its axis be parallel to the axis of the earth, and the sphere have such lines upon it, and such planes within it, as above described; it will shew the hours of the day as truly as if it were placed at the earth's centre, and the shell of the earth were as transparent as glass. But because it is impossible to have a hollow sphere of glass perfectly true, blown round a solid plane; or if it was, we could not get at the plane within the glass to set it in any given position; we make use of a wire sphere to explain the principles of dialing, by joining 24 semicircles together at the poles, and putting a thin flat plate of brass within it. See fig. 1 and 2.

DIALING BY THE TERRESTRIAL GLOBE.

A common globe of 12 inches diameter, has generally 24 meridian semicircles drawn upon it. If such a globe be elevated to the latitude of any given place, and turned about until one of these meridians cut the horizon in the north point, where the hour of XII is supposed to be marked, the rest of the meridians will cut the horizon at the respective distances of all the other hours from XII. Then if these points of distance be marked on the horizon, and the globe be taken out of the horizon, and a flat board or plate be put into its place, even with the surface of the horizon; and if straight lines be drawn from the centre of the board, to those points of distance on the horizon which were cut by the 24 meridian semicircles; these lines will be the hour-lines of a horizontal dial for that latitude, the edge of whose gnomon must be in the very same situation that the axis of the globe was before it was taken out of the horizon: that is, the gnomon must make an angle with the plane of the dial, equal to the latitude of the place for which the dial is made. If the pole of the globe be elevated to the co-latitude of the given place, and any meridian be brought to the north point of the horizon, the rest of the meridians will cut the horizon in the respective distances of all the hours from XII, for a direct south dial, whose gnomon must make an angle with the plane of the dial, equal to the co-latitude of the place; and the hours must be set the contrary way on this dial to what they are on the horizontal. But if the globe have more than 24 meridian semicircles upon it, we must take the following method for making horizontal and south dials. Elevate the pole to the latitude of the place, and turn the globe until any particular meridian (suppose the first) comes to the north point of the horizon, and the opposite meridian will cut the horizon in the south. Then, set the hour-index to the uppermost XII on its circle; which done, turn the globe westward until 15 degrees of the equator pass under the brazen meridian, and then the hour index will be at I, (for the sun moves 15 degrees every hour,) and the first meridian will cut the horizon in the number of degrees from the north point that I is distant from XII. Turn on until other 15-degrees of the equa-

tor pass under the brazen meridian, and the hour index will then be at II, and the first meridian will cut the horizon in the number of degrees that II is distant from XII: and so, by making 15 degrees of the equator pass under the brazen meridian for every hour, the first meridian of the globe will cut the horizon in the distances of all the hours from XII to VI, which is just 90 degrees; and then the distances of XI, X, IX, VIII, VII, and VI, in the forenoon, will be same from XII, as the distances of I, II, III, IV, V, and VI, in the afternoon; and these hour lines continued through the centre, will give the opposite hour lines on the other half of the dial. To make a horizontal dial for the latitude of London, which is $51\frac{1}{2}$ degrees north, elevate the north pole of the globe $51\frac{1}{2}$ degrees above the north point of the horizon; and then turn the globe, until the first meridian (which is that of London on the English terrestrial globe) cuts the north point of the horizon, and set the hour index to XII at noon. Then turning the globe westward until the index points successively to I, II, III, IV, V, and VI, in the afternoon, or until 15, 30, 45, 60, 75, and 90 degrees of the equator pass under the brazen meridian, the first meridian of the globe will cut the horizon in the following numbers of degrees from the north towards the east, viz. $11\frac{3}{4}$, $24\frac{1}{2}$, $38\frac{1}{2}$, $53\frac{1}{2}$, $71\frac{1}{2}$, and 90; which are the respective distances of the above hours from XII, upon the plane of the horizon. To transfer these, and the rest of the hours, to a horizontal plane, draw the parallel right lines *ac*, and *db*, fig. 3, upon that plane, as far from each other as is equal to the intended thickness of the gnomon or stile of the dial, and the space included between them will be the meridian or twelve o'clock line on the dial. Cross this meridian at right angles with the six o'clock line *kh*, and setting one foot of the compasses in the intersection *a*, as a centre, describe the quadrant *ke* with any convenient radius or opening of the compasses: then, setting one foot in the intersection *b*, as a centre, with the same radius describe the quadrant *fh*, and divide each quadrant into 90 equal parts or degrees, as in the figure. As the hour-lines are less distant from each other about noon, than in any other part of the dial, it is best to have the centres of these quadrants at a little distance from the centre of the dial plane, on the side opposite to XII, in order to enlarge the hour-distances thereabouts, under the same angles on the plane. Thus, the centre of the plane is at *C*, but the centres of the quadrants are at *a* and *b*. Lay a ruler over the point *b*, (and keeping it there for the centre of all the afternoon hours in the quadrant *fh*) draw the hour-line of I through $11\frac{3}{4}$ degrees in the quadrant; the hour-line of II, through $24\frac{1}{2}$ degrees; of III, through $38\frac{1}{2}$ degrees; IV, through $53\frac{1}{2}$; and V, through $71\frac{1}{2}$; and because the sun rises about 4 in the morning, on the longest days at London, continue the hour-lines of IV and V in the afternoon through the centre *b* to the opposite side of the dial. This done, lay the ruler to the centre *a* of the quadrant *ek*; and through the like divisions or degrees of that quadrant, viz. $11\frac{3}{4}$, $24\frac{1}{2}$, $38\frac{1}{2}$, $53\frac{1}{2}$, $71\frac{1}{2}$, draw the forenoon hour-lines of XI, X, IX, VIII, and VII; and because the sun sets not before 8 in the evening on the longest days, continue the hour-lines of VII and VIII in the forenoon, through the centre *a*, to VII and VIII in the afternoon; and all the hour-lines will be finished on this dial; to which the hours may be set, as in the figure. Lastly, through $51\frac{1}{2}$ degrees of either quadrant, and from its centre, draw the right line *ag* for the hypotenuse or axis of the gnomon *agi*; and from *g*, let fall the perpendicular *gi*, upon the meridian-line *ai*, and there will be a triangle made, whose sides are *ag*, *gi*, and *ia*. If a plate similar to this triangle be made as thick as the distance between the lines *ac* and *bd*, and set upright between them, touching at *a* and *b*, its hypotenuse *ag* will be parallel to the axis of the world, when the dial is truly set; and will cast a shadow on the hour of the day. The trouble of dividing the two quadrants may be saved by a scale with a line of chords upon it.

To make an ERECT DIRECT SOUTH DIAL, fig. 4, elevate the pole to the co-latitude of the place, and proceed in all respects as above for the horizontal dial, and from VI in the morning to VI in the afternoon; only the hours must be reversed, as in the figure; and the hypotenuse *ag* of the gnomon *agi*, must make an angle with the dial-plane equal to the co-latitude of the place. As the sun can shine no longer on this dial than from six in the morning until six in the evening, there is no occasion for having any more than 12 hours upon it.

To make an ERECT DIAL, DECLINING from the S. towards the E. or

E. or W. elevate the pole to the latitude of the place, and screw the quadrant of altitude to the zenith. Then, if the dial declines towards the E. (which we shall suppose it does), count in the horizon the degrees of declination, from the E. point towards the N. and bring the lower end of the quadrant to that degree of declination at which the reckoning ends. This done, bring any particular meridian of the globe (suppose the first) directly under the graduated edge of the upper part of the brazen meridian, and set the hour to XII at noon. Then, keeping the quadrant of altitude at the degree of declination in the horizon, turn the globe eastward on its axis, and observe the degrees cut by the first meridian in the quadrant of altitude (counted from the zenith) as the hour index comes to XI, X, IX, &c. in the forenoon, or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian at these hours respectively; and the degrees then cut in the quadrant by the first meridian, are the respective distances of the forenoon hours from XII on the plane of the dial. Then, for the afternoon hours, turn the quadrant of altitude round the zenith until it comes to the degree in the horizon opposite to that where it was placed before; namely, as far from the W. point of the horizon towards the S. as it was set at first from the E. point towards the N.; and turn the globe westward on its axis, until the first meridian comes to the brazen meridian again, and the hour index to XII: then continue to turn the globe westward, and as the index points to the afternoon hours I, II, III, &c. or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian, the first meridian will cut the quadrant of altitude in the respective number of degrees from the zenith that each of these hours is from XII on the dial. And when the first meridian goes off the quadrant at the horizon in the forenoon, the hour index shews the time when the sun will come upon this dial; and when it goes off the quadrant in the afternoon, the index will point to the time when the sun goes off the dial. Having thus found all the hour distances from XII, lay them down upon the dial plane, either by dividing a semicircle into two quadrants of 90 degrees each, (beginning at the hour-line of XII,) or by the line of chords, as above directed. In all declining dials, the line on which the stile or gnomon stands (commonly called the substile line) makes an angle with the 12 o'clock line, and falls among the forenoon hour-lines, if the dial declines towards the E.; and among the afternoon hour-lines, when the dial declines towards the W. that is, to the left hand from the 12 o'clock line in the former case, and to the right hand from it in the latter. To find the distance of the substile from the 12 o'clock line, if the dial declines from the S. toward the E. count the degrees of the declination in the horizon from the E. point toward the N. and bring the lower end of the quadrant of altitude to that degree of declination where the reckoning ends: then, turn the globe until the first meridian cuts the horizon in the like number of degrees, counted from the S. point toward the E. and the quadrant and first meridian will then cross one another at right angles; and the number of degrees of the quadrant, which are intercepted between the meridian and the zenith, is equal to the distance of the substile line from the 12 o'clock line; and the number of degrees of the first meridian, which are intercepted between the quadrant and the north pole, is equal to the elevation of the stile above the plane of the dial. If the dial declines westward from the S. count that declination from the E. point of the horizon towards the S. and bring the quadrant of altitude to the degree in the horizon at which the reckoning ends; both for finding the forenoon hours, and distance of the substile from the meridian: and for the afternoon hours, bring the quadrant to the opposite degree in the horizon, namely, as far from the W. towards the N. and then proceed in all respects as above. Thus when our declining dial is finished, we have four dials, viz. 1. A north dial declining eastward by the same number of degrees. 2. A north dial declining the same number west. 3. A south dial, declining east. And, 4. A south dial declining west; only, placing the proper number of hours, and the stile or gnomon respectively, upon each plane. For, in the S. W. plane, the substilar line falls among the afternoon hours; and in the S. E. of the same declination, among the forenoon hours, at equal distances from XII. And so all the morning hours on the W. decliner will be like the afternoon hours on the E. decliner; the S. E. decliner will produce the N. W. decliner; and the S. W. decliner, the N. E. decliner, by only extending the hour-lines, stile and

substile, quite through the centre: the axis of the stile (or edge that casts the shadow on the hour of the day) being in all dials whatever parallel to the axis of the world, and consequently pointing towards the north pole of the heaven in north latitudes, and towards the south pole, in south latitudes.

METHOD OF CONSTRUCTING DIALING LINES.

Describe, with any opening of the compasses, as EA, Fig. 5, according to the intended length of the scale, the circle ADCB, and cross it at right angles by the diameters CEA and DEB; divide the quadrant AB first into 9 equal parts, and then each part into 10; so shall the quadrant be divided into 90 equal parts or degrees. Draw the right line AFB for the chord of this quadrant; and setting one foot of the compasses in the point A, extend the other to the several divisions of the quadrant, and transfer these divisions to the line AFB by the arcs 10, 10, 20, 20, &c. and this will be a line of chords, divided into 90 unequal parts. Divide the quadrant CD into 90 equal parts, and from each point of division draw right lines, as *i, k, l*, &c. to the line CE; all perpendicular to that line, and parallel to DE, which will divide EC into a line of sines; and although these are seldom put among the dialing lines on a scale, yet they assist in drawing the line of latitudes. For if a ruler be laid upon the point D, and over each division in the line of sines, it will divide the quadrant CB into 90 unequal parts, as *Ba, Bb*, &c. shewn by the right lines *10a, 20b, 30c*, &c. drawn along the edge of the ruler. If the right line BC be drawn, subtending this quadrant, and the nearest distances *Ba, Bb, Bc*, &c. be taken in the compasses from B, and set upon this line in the same manner as directed for the line of chords, it will make a line of latitudes BC, equal in length to the line of chords AB, and an equal number of divisions, but very unequal as to their lengths. Draw the right line DGA, subtending the quadrant DA; and parallel to it, draw the right line *rs*, touching the quadrant DA at the numeral figure 3. Divide this quadrant into six equal parts, as 1, 2, 3, &c. and through these points of division draw right lines from the centre E to the line *rs*, which will divide it at the points where the six hours are to be placed, as in the figure. If every sixth part of the quadrant be sub-divided into four equal parts, right lines drawn from the centre through these points of division, and continued to the line *rs*, will divide each hour upon it into quarters.

METHOD OF CONSTRUCTING DIALS BY MEANS OF THE DIALING LINES.

This is the easiest of all mechanical methods, and by much the best, when the lines are truly divided: and not only the half-hours and quarters may be laid down by all of them, but every fifth minute by most, and every single minute by those where the line of hours is a foot in length. Having drawn the double meridian-line *ab, cd*, fig. 6, on the plane intended for a horizontal dial, and crossed it at right angles by the six o'clock line *fe* (as in fig. 3,) take the latitude of the place with the compasses, in the scale of latitudes, and set that extent from *c* to *e*, and from *a* to *f*, on the six o'clock line: then, taking the whole six hours between the points of the compasses in the scale of hours, with that extent set one foot on the point *e*, and let the other foot fall where it will upon the meridian-line *cd*, as at *d*. Do the same from *f* to *b*, and draw the right lines *ed* and *fb*, each of them will be equal in length to the whole scale of hours. This done, setting one foot of the compasses in the beginning of the scale at XII, and extending the other to each hour on the scale, lay off these extents from *d* to *e* for the afternoon hours, and from *b* to *f* for those of the forenoon; this will divide the lines *de* and *bf* in the same manner as the hour-scale is divided at 1, 2, 3, 4, and 5; on which the quarters may also be laid down, if required. Then, laying a ruler on the point *c*, draw the first five hours in the afternoon, from that point, through the dots at the numeral figures 1, 2, 3, 4, 5, on the line *de*; and continue the lines of IV and V through the centre *c*, to the other side of the dial, for the like hours of the morning; which done, lay the ruler on the point *a*, and draw the last five hours in the forenoon through the dots 5, 4, 3, 2, 1, on the line *fb*; continuing the hour-lines of VII and VIII through the centre *a* to the other side of the dial, for the like hours of the evening; and set the hours to their respective lines, as in the figure. Lastly, make

the gnomon the same way as directed above for the horizontal dial, and the whole will be finished.

To make an **ERECT SOUTH DIAL**, take the co-latitude of your place from the scale of latitudes, and then proceed in all respects for the hour-line as in the horizontal dial; only reversing the hours, as in fig. 4, and making the angle of the stile's height equal to the co-latitude.

GEOMETRICAL METHOD OF DRAWING THE HOUR LINES UPON DIALS.

I. To construct a **HORIZONTAL DIAL**, fig. 7. Describe with any opening of the compasses, as *ZL*, the two semicircles *LFh* and *LQh*, upon the centres *Z* and *z*, where the six o'clock line crosses the double meridian-line, and divide each semicircle into 12 equal parts, beginning at *L* (though strictly speaking, only the quadrants from *L* to the six o'clock line need be divided); then connect the divisions which are equidistant from *L*, by the parallel line *KM*, *IN*, *HO*, *GP*, and *FQ*. Draw *VZ* for the hypothenuse of the stile, making the angle *VZE* equal to the latitude of your place; and continue the line *VZ* to *R*. Draw the line *Rr* parallel to the six o'clock line, and set off the distance *aK* from *Z* to *Y*, the distance *bI* from *Z* to *X*, *cH* from *Z* to *W*, *dG* from *Z* to *T*, and *eF* from *Z* to *S*. Then draw the lines *Ss*, *Tt*, *Ww*, *Xx*, and *Yy*, each parallel to *Rr*. Set off the distance *yY*, from *a* to 11, and from *f* to 1; the distance *Xx* from *b* to 10, and from *g* to 2; *wW* from *c* to 9, and from *h* to 3; *tT* from *d* to 8, and from *i* to 4; *sS* from *e* to 7, and from *n* to 5. Then laying a ruler to the centre *Z*, draw the forenoon hour-lines through the points 11, 10, 9, 8, 7; and laying it to the centre *z*, draw the afternoon lines through the points 1, 2, 3, 4, 5; continuing the forenoon lines of VII and VIII through the centre *Z*, to the opposite side of the dial, for the like afternoon hours; and the afternoon lines IV and V through the centre *z*, to the opposite side, for the like morning hours. Set the hours to these lines as in the figure, and then erect the stile or gnomon, and the horizontal dial will be finished.

II. To construct a **SOUTH DIAL**, draw the line *VZ*, making an angle with the meridian *ZL*, equal to the co-latitude of your place; and proceed in all respects as in the above horizontal dial for the same latitude, reversing the hours as in fig. 4, and making the elevation of the gnomon equal to the co-latitude.

III. To construct a **NORTH DIAL**. See fig. 8. If the hour-lines IV and V, as also VII and VIII on the south dial, fig. 4, be continued beyond the line VI a VI, and the triangle *agh* turned about the point *a*, till *ah* fall on a XII produced, it is evident a north dial is thereby had. The hour-line for VII in the morning, on the south dial, when produced, forms the hour-line for V in the morning on the north dial; and the hour-line for V in the afternoon, on the south dial, forms the hour-line for VII in the evening on the north dial. The manner of placing the characters for the other hours is therefore obvious.

IV. To describe an **EAST DIAL**. On the eastern side of the plane of the meridian, draw a line *AB*, fig. 9, parallel to the horizon; draw also a line *AK*, making with *AB* an angle *KAB* equal to the complement of the latitude of the place for which the dial is made. Take a point *D* in *AK*, and on that point for a centre describe a circle. Through *D* draw *EC* perpendicular to *AK*, thus the circle will be divided into four quadrants; divide two of these quadrants into 6 equal parts, as in the figure. Draw a straight line *FEG* perpendicular to *EC*, the diameter of the circle, and from the centre *D*, through the several divisions, draw the right lines *DIV*, *DV*, *DVI*, *DVII*, *DVIII*, *DIX*, *DX*, *DXI*. Through *IV*, *V*, *VI*, *VII*, &c. draw lines *IVIV*, *VV*, &c. parallel to *EDC*. Lastly, in *D* erect a stile equal to the radius *DE*, perpendicular to the plane; or on two little pieces perpendicularly fixed in *EC*, and equal to the same *DE*, fit an iron rod parallel to *EC*, thus will each index at the several hours project a shadow to the respective hour-lines *IVIV*, *VV*, *VI VI*, &c. The east dial, it is obvious, can only shew the hours till twelve o'clock.

V. To describe a **WEST DIAL**. The construction is perfectly the same as that of an east dial, only that its situation is inverted, and the hours are written accordingly. A west dial, it is obvious, can only be illuminated after noon, and therefore, joined with an east dial, shews all the hours of the day.

VI. To describe a **PORTABLE DIAL**. This dial is represented in fig. 10, and may be drawn upon a card and carried in a pocket book. Draw the occult line *AB*, fig. 11, parallel to the top of the card, and cross it at right angles with the six o'clock line *ECD*; then upon *C*, as a centre, with the radius *CA*, describe the semicircle *AEL*, and divide it into 12 equal parts (beginning at *A*), as *Ar*, *As*, &c. and from these points of division draw the hour-lines *r*, *s*, *t*, *u*, *v*, *E*, *w*, and *x*, all parallel to the six o'clock line *EC*. If each part of the semicircle be subdivided into four equal parts, they will give the half hour-lines and quarters, as in fig. 12. Draw the right line *ASDo*, making the angle *SAB* equal to the latitude of your place. Upon the centre *A* describe the arch *RST*, and set off upon the arcs *SR* and *ST*, each equal to $23\frac{1}{2}$ degrees for the sun's greatest declination; and divide them into $23\frac{1}{2}$ equal parts, as in fig. 12. Through the intersection *D* of the lines *ECD* and *ADo*, draw the right line *FDG* at right angles to *ADo*. Lay a ruler to the points *A* and *R*, and draw the line *ARF* through $23\frac{1}{2}$ degrees of south declination in the arc *SR*; and then laying the ruler to the points *A* and *T*, draw the line *ATG* through $23\frac{1}{2}$ degrees of north declination in the arc *ST*: so shall the lines *ARF* and *ATG* cut the line *FDG* in the proper lengths for the scale of months. Upon the centre *D*, with the radius *DF*, describe the semicircle *FoG*; which divide into six equal parts, *Fm*, *mn*, *no*, &c. and from these points of division draw the right lines *mh*, *ni*, *pk*, and *ql*, each parallel to *oD*. Then setting one foot of the compasses in the point *F*, extend the other to *A*, and describe the arc *AZH* for the tropic of φ ; (see fig. 10 and 11,) with the same extent, setting one foot in *G*, describe the arc *AEO* for the tropic of $\ominus$. Next setting one foot in the point *h*, and extending the other to *A*, describe the arc *ACI* for the beginnings of the signs ♈ and ♉ ; and with the same extent, setting one foot in the point *i*, describe the arc *AN* for the beginnings of the signs ♊ and ♋ . Set one foot in the point *z*, and having extended the other to *A*, describe the arc *AK* for the beginnings of the signs ♌ and ♍ ; and with the same extent, set one foot in *k*, and describe the arc *AM* for the beginning of the signs ♎ and ♏ . Then setting one foot in the point *D*, and extending the other to *A*, describe the curve *AL* for the beginnings of ♐ and ♑ ; and the signs will be finished. This done, lay a ruler from the point *A* over the sun's declination in the arch *RST*; and where the ruler cuts the line *FDG*, make marks: and place the days of the months right against these marks, in the manner shewn by fig. 10. Lastly, draw the shadow-line *PQ* parallel to the occult line *AB*; make the gnomon, and set the hours to their respective lines, as in fig. 10, and the dial will be finished. The lines *a d*, *a b*, and *b e* of the gnomon, must be cut quite through the card; and as the end *a b* of the gnomon is raised occasionally above the plane of the dial, it turns upon the uncut line *c d* as on a hinge. The dotted line *AB* must be slit quite through the card, and the thread *C* must be put through the slit, and have a knot tied behind, to keep it from being easily drawn out. On the other end of this thread is a small plummet *D*, and on the middle of it a small bead for shewing the hour of the day. To rectify this dial, set the thread in the slit right against the day of the month, and stretch the thread from the day of the month over the angular point where the curve lines meet at XII; then shift the bead to that point on the thread, and the dial will be rectified. To find the hour of the day, raise the gnomon, (no matter how much or how little) and hold the edge of the dial next the gnomon towards the sun, so as the uppermost edge of the shadow of the gnomon may just cover the shadow-line; and the bead then playing freely on the face of the dial, by the weight of the plummet, will shew the time of the day among the hour-lines as it is forenoon or afternoon. To find the time of sun rising and setting, move the thread among the hour-lines, until it either covers some one of them, or lies, parallel betwixt any two; and then it will cut the time of sun-rising among the forenoon hours; and of the sun-setting among the afternoon hours, for that day of the year to which the thread is set in the scale of months. To find the sun's declination, stretch the thread from the day of the month over the angular point at XII, and it will cut the sun's declination, as it is north or south, for that day, in the proper scale. To find on what days the sun enters the signs: when the bead, as above rectified, moves along any of the curve lines which have the signs of the zodiac marked upon them, the sun enters those signs on the days pointed out by the thread in the scale of months.

OF UNIVERSAL DIALS.

I. The Universal Dial, invented by Pardie, fig. 12, consists of three principal parts; the first whereof is called the horizontal plane (A,) because in practice it must be parallel to the horizon. In this plane is fixed an upright pin, which enters into the edge of the second part BD, called the meridional plane; which is made of two pieces, the lowest whereof (B) is called the quadrant, because it contains a quarter of a circle, divided into 90 degrees; and it is only into this part, near B, that the pin enters. The other piece is a semicircle (D) adjusted to the quadrant, and turning in it by a groove, for raising and depressing the diameter (EF) of the semicircle, which diameter is called the axis of the instrument. The third piece is a circle (G,) divided on both sides into 24 equal parts, which are the hours. This circle is put upon the meridional plane so, that the axis (EF) may be perpendicular to the circle, and the point C be the common centre of the circle, semicircle, and quadrant. The straight edge of the semicircle is chamfered on both sides to a sharp edge, which passes through the centre of the circle. On one side of the chamfered part, the first six months of the year are laid down, according to the sun's declination for their respective days, and on the other side the last six months. And against the days on which the sun enters the signs, there are straight lines drawn upon the semicircle, with the characters of the signs marked upon them. There is a black line drawn along the middle of the upright edge of the quadrant, over which hangs a thread (H,) with its plummet (I,) for levelling the instrument. From the 23d Sept to the 21st March, the upper surface of the circle must touch both the centre C of the semicircle, and the line of φ and $\simeq$; and from the 21st March to the 23d Sept. the lower surface of the circle must touch that centre and line. To find the time of day by this dial, set it on a level place in sun-shine, and adjust it by the levelling screws *k* and *l*, until the plumb-line hangs over the back line upon the edge of the quadrant, and parallel to the said edge; move the semicircle in the quadrant, until the line of φ and $\simeq$ (where the circle touches) comes to the latitude of your place in the quadrant; then turn the whole meridional plane BD, with its circle G, upon the horizontal plane A, until the edge of the shadow of the circle falls precisely on the day of the month in the semicircle; and then the meridional plane will be due N. and S. the axis EF will be parallel to the axis of the world, and will cast a shadow upon the true time of the day among the hours of the circle. When the instrument is thus rectified, the quadrant and semicircle are in the plane of the meridian, and the circle is then in the plane of the equinoctial. Therefore, as the sun is above the equinoctial in summer (in northern latitudes,) and below it in winter; the axis of the semicircle will cast a shadow on the hour of the day, on the upper surface of the circle, from the 21st March till the 23d of Sept.; and from the 23d of Sept. to the 21st March, the hour of the day will be determined by the shadow of the semicircle upon the lower surface of the circle. In the former case, the shadow of the circle falls upon the day of the month, on the lower part of the diameter of the semicircle; and in the latter case, on the upper part. The method of laying down the months and signs upon the semicircle is as follows: Draw the right line ACB, fig. 13, equal to the diameter of the semicircle ADB, and cross it in the middle at right angles with the line ECD, equal in length to ADB; then EC will be the radius of the circle FCG, which is the same as that of the semicircle. Upon E, as a centre, describe the circle FCG, on which set off the arcs Ch and Ci, each equal to $23\frac{1}{2}$ degrees, and divide them accordingly into that number for the sun's declination. Then laying the edge of a ruler over the centre E, and also over the sun's declination for every fifth day of each month (as in the card dial,) mark the points on the diameter AB of the semicircle from *a* to *g*, which are cut by the ruler; and there place the days of the months accordingly, answering to the sun's declinations. This done, setting one foot of the compasses in C, and extending the other to *a* or *g*, describe the semicircle *abcdefg*; which divide into six equal parts, and through the points of division draw right lines parallel to CD, for the beginning of the signs (of which one-half are on one side of the semicircle and the other half on the other,) and set the characters of the signs to their proper lines, as in the figure.

II. An Universal Dial on a plain cross, fig. 14, 15, 16, as described by Mr. Ferguson. It is moveable on a joint C, for elevating it to any given latitude on the quadrant Co 90, as it stands

upon the horizontal board A. The arms of the cross stand at right angles to the middle part; and the top of it, from *a* to *n*, is of equal length with either of the arms *ne* or *mk*. See fig. 14. The dial is rectified by setting the middle line *tu* to the latitude of the place on the quadrant, the board A level, and the point N. northward by the needle; thus, the plane of the cross will be parallel to the plane of the equator. Then, from III o'clock in the morning till VI, the upper edge *k* of the arm *io* will cast a shadow on the time of the day on the side of the arm *cm*; from VI. till IX., the lower edge *i* of the arm *io* will cast a shadow on the hours on the side *og*. From IX. in the morning to XII. at noon, the edge *ab* of the top part *an* will cast a shadow on the hours on the arm *nef*; from XII. to III. in the afternoon, the edge *cd* of the top part will cast a shadow on the hours on the arm *klm*; from III. to VI. in the evening, the edge *gh* will cast a shadow on the hours on the part *pu*; and from VI. till IX. the shadow of the edge *ef* will shew the time on the top part *an*. The breadth of each part *ab, ef, &c.* must be so great, as never to let the shadow fall quite without the part or arm on which the hours are marked, when the sun is at his greatest declination from the equator. To determine the breadth of the sides of the arms which contain the hours, so as to be in just proportion to their length; make an angle ABC (fig. 16,) of $23\frac{1}{2}$ degrees, which is equal to the sun's greatest declination: and suppose the length of each arm, from the side of the long middle part, and also the length of the top part above the arms, to be equal to Bd. Then as the edges of the shadow, from each of the arms, will be parallel to Be, making an angle of $23\frac{1}{2}$ degrees with the side Bd of the arm, when the sun's declination is $23\frac{1}{2}$; it is plain, that if the length of the arm be Bd, the least breadth that it can have, to keep the edge Be of the shadow Begd from going off the side of the arm de before it comes to the end of it ed, must be equal to ed or dB. But to keep the shadow within the quarter divisions of the hours, when it comes near the end of the arm, the breadth of it should be still greater, so as to be almost doubled, on account of the distance between the tips of the arms. The hours may be placed on the arms, by laying down the cross *abcd*, fig. 15, on a sheet of paper: and with a black lead pencil held close to it, drawing its shape and size on the paper. Then take the length *ae* in the compasses, and with one foot in the corner *a* describe with the other the quadrant *cef*. Divide this arc into six equal parts, and through the points of division draw light lines *ag, ah, &c.* continuing three of them to the arm *ce*, which are all that can fall upon it; and they will meet the arm in those points through which the lines that divide the hours from each other, as in fig. 14, are to be drawn right across it. Divide each arm for the three hours contained in it, in the same manner; and set the hours to their proper places, on the sides of the arms, as they are marked in fig. 14. Each of the hour-spaces should be divided into four equal parts, for the half-hours and quarters, in the quadrant *cef*; and right lines should be drawn through these division-marks in the quadrant, to the arms of the cross, in order to determine the places thereon where the subdivision of the hours must be marked. This kind of universal dial is easily made, and has a pretty uncommon appearance in a garden.

III. The Universal Mechanical Dial, fig. 17, affords, by its equinoctial circle, an easy method of describing a dial on any kind of plane. For example: Suppose a dial is required on an horizontal plane. If the plane be immoveable as ABCD, find a meridian-line as GF; or if moveable, assume the meridian at pleasure: then by means of the triangle EKE, whose base is applied on the meridian-line, raise the equinoctial dial H till the index GI becomes parallel to the axis of the earth, (which is so, if the angle KEF be equal to the elevation of the pole,) and the 12 o'clock line on the dial hang over the meridian-line of the plane or the base of the triangle. If then, in the night, or in a dark place, a lighted candle be successively applied to the axis GI, so as the shadow of the index or style GI shall fall upon one hour-line after another, the same shadow will mark out the several hour-lines on the plane ABCD. Noting the points therefore on the shadow, draw lines through them to G; then an index being fixed on G, according to the angle IGF, its shadow will point out the several hours by the light of the sun. If a dial were required on a vertical plane, having raised the equinoctial circle as directed, push forward the index GI till the tip thereof I touch the plane. If the plane be inclined to the horizon, the elevation of the pole should be found on the same;

same; and the angle of the triangle KEF should be made equal thereto. The hour-lines may be found by projection thus, on the centre Z, Plate LVII. fig. 25, describe a circle as ENWS to represent the horizon of the given place, suppose London; draw N. S. and E. W. at right angles to it, find the pole P by the stereographic projection of the sphere, see PROJECTION OF THE SPHERE. then project the meridians 1 P a, 2 P b, 3 P c, &c. making the angles N P a, N P b, N P c, &c. equal to 15°, 30°, 45°, &c. Lay a ruler from the points in which these hour-circles cut the horizon, and draw the lines 1 I., 2 II., 3 III., 4 IV., &c. and they will be the true hour-lines of the dial. Set off the latitude from S to A, in this case 51° 32', and draw Z A for the stile, which placed over Z S will complete the dial. The arcs N a, N b, N c, &c. may be easily calculated trigonometrically since in triangles N P a, N P b, N P c, &c. there is given the side N, P and the angle at P, the angle at N being a right angle. We proceed to the calculation as follows.

DIALING by SPHERICAL TRIGONOMETRY.

The construction of sun-dials on all planes whatever may be included in one general rule: intelligible, if that of a horizontal dial for any given latitude be well understood. For there is no plane, however obliquely situated with respect to any given place, but what is parallel to the horizon of some other place; and therefore if we can find that other place by a problem on the terrestrial globe, or by a trigonometrical calculation, and construct a horizontal dial for it; that dial applied to the plane where it is to serve will be a true dial for that place.—Thus, an erect direct S. dial in 51½ degrees N. latitude, would be a horizontal dial on the same meridian, 90° southward of 51½ degrees of N. latitude: which falls in with 38½ degrees of S. latitude. But if the upright plane declines from facing the S. at the given place, it would still be a horizontal plane 90° from that place, but for a different longitude, which would alter the reckoning of the hours accordingly. To calculate the angles which the hour-lines of a horizontal dial make with the meridian or twelve o'clock line: See fig. 18. Let N E S W represent the horizon of any place, P S N the meridian, and P the north pole of the sphere: let K P H be any hour-circle, for example the circle which makes with the meridian an angle of 15 degrees; then it is evident from what has been said in the preceding part of this article, that N H, the arc of the horizon intercepted between N, the north, and P H the hour-circle in whose plane the sun is at XI or 1 o'clock, measures the angle contained by the substile of the dial, and the hour-lines corresponding to these hours. In the spherical triangle P N H, right-angled at N, there are given the side P N which is the elevation of the pole above the horizon, and the angle N P H which is contained by the meridian and hour-circle, to find N H the arc of the horizon opposite that angle. By spherical trigonometry, radius is to the sine of P N as the tangent of N P H to the tangent of N H the side required. Hence we have this practical rule. To find the angle which any hour-line of a horizontal dial makes with the meridian, or which is the same, to find the angle which the hour-lines on any dial make with the substile:—To the logarithmic sine of the latitude of the place for which the dial is made, add the log. tangent of the sun's distance from the meridian for the hour required, the sum, abating 10, is the log. tangent of the angle required.

Example. To find the angles which the hour-lines of XI or I make with the meridian of a horizontal dial for the latitude of London, which is 51½°

To log. sine of 51° 30'	9.89354
Add log. tan. of 15°	9.42805
Sum, rejecting 10, is	9.32159

which is the tangent of 11° 51' nearly. In like manner it will be found, that the hour-lines of X and II make each with the meridian an angle of 24° 18' &c. And by computing in this manner, with the sine of the latitude, and the tangents of 30, 45, 60, and 75°, for the hours of II, III, IV, and V, in the afternoon; or of X, IX, VIII, and VII, in the forenoon; you will find their angular distances from XII to be 24° 18', 38° 3', 53° 35', and 71° 6'; which are all that there is occasion to compute for.—And these distances may be set off from XII by a line of chords; or rather, by taking 1000 from a scale of equal parts, and setting that extent as a radius from C to XII, fig. 19, and then, taking 209 of the same parts (which are the natural tangents of 11° 50'), and setting them

from XII to XI and I, on the line *ho*, which is perpendicular to C XII: and so for the rest of the hour-lines, which in the table of natural tangents, against the above distances, are 452, 782, 1355, and 2920, of such equal parts from XII as the radius C XII contains 1000. And, lastly, set off 125, (the natural tangent of 51° 30') for the angle of the stile's height, which is equal to the latitude of the place.

DECLINING DIALS. Let us suppose that an upright plane at London declines 36 degrees westward from facing the south, and that it is required to find a place on the globe to whose horizon the said plane is parallel; and also the difference of longitude between London and that place. Let N E S W be the horizon of London, fig. 21, whose zenith is Z, and P the north pole of the sphere; and let Z h be the position of a vertical plane at Z, declining westward from S (the south) by an angle of 36 degrees; on which plane an erect dial for London at Z is to be described. Make the semi-diameter ZD perpendicular to Zh; and it will cut the horizon in D, 36 degrees west of the south S. Then a plane, in the tangent HD, touching the sphere in D, will be parallel to the plane Zh; and the axis of the sphere will be equally inclined to both these planes. Let W Q E be the equinoctial, whose elevation above the horizon of Z (London) is 38½ degrees; and PRD be the meridian of the place D, cutting the equinoctial in R. Then it is evident, that the arc RD is the latitude of the place D (where the plane Zh would be horizontal) and the arc RQ is the difference of longitude of the planes Zh and DH. 1. In the spherical triangle W D R, the arc W D is given, for it is the complement of the plane's declination from S the south; which complement is 54° (viz. 90° — 36°) the angle at R, in which the meridian of the place D cuts the equator, is a right angle; and the angle R W D measures the elevation of the equinoctial above the horizon of Z, namely 38½ degrees. Say therefore, As radius is to the co-sine of the plane's declination from the south, so is the co-sine of the latitude of Z to the sine of RD the latitude of D: which is of a different denomination from the latitude of Z, because Z and D are on different sides of the equator.

As radius	10.00000
To co-sine 36° 0' = RQ	9.90796
So co-sine 51° 30' = QZ	9.79415

To sine 30° 14' = DR (9.70211) = the latitude of D, whose horizon is parallel to the vertical plane Zh at Z. 2. To find RQ the difference of longitude of the places D and Z, say, As radius is to the cosine of R W D 38½ degrees, the height of the equinoctial at Z, so is the co-tangent of DW 36 degrees, the plane's declination, to the co-tangent of RQ the difference of longitudes. Thus,

To the logarithmic sine of 51° 30'	9.89354
Add to the logarithmic tang. of 54° 0'	10.13874

Their sum rejecting 10.....10.03228 is the nearest tangent of 47° 8' = WR; which is the co-tangent of 42° 52' = RQ, the difference of longitude sought. Which difference, being reduced to time, is 2 hours 51½ minutes. 3. And thus having found the latitude and longitude of the place D, to whose horizon the vertical plane at Z is parallel, we proceed to the construction of a horizontal dial for the place D, whose latitude is 30° 14' south; but anticipating the time at D by 2 hours 51 minutes (neglecting the ½ min. in practice,) because D is so far westward in longitude from the meridian of London; and this will be a true vertical dial at London, declining westward 36 degrees. Assume any right line CSL, fig. 19, for the substile of the dial, and make the angle KCP equal to the latitude of the place (viz. 30° 14'), to whose horizon the plane of the dial is parallel; then CRP will be the axis of the stile, or edge that casts the shadow on the hours of the day, in the dial. This done, draw the contingent line EQ, cutting the substilar line at right angles in K; and from K make KR perpendicular to the axis CRP. Then KG (=KR) being made radius, that is, equal to the chord of 60° or tangent of 45°, on a good sector take 42° 52' (the difference of longitude of the places Z and D) from the tangents, and having set it from K to M, draw CM for the hour-line of XII. Take KN, equal to the tangent of an angle less by 15 degrees than KM; that is, the tangent of 27° 52'; and through the point N draw CN for the hour-line of I. The tangent of 12° 52' (which is 15° less than 27° 52'), set off the same way, will give a point between K and N, through which the hour-
line

line of II is to be drawn. The tangent of $2^{\circ} 8'$ (the difference between 45° and $50^{\circ} 52'$) placed on the other side of CL, will determine the point through which the hour-line of III is to be drawn: to which $2^{\circ} 8'$, if the tangent of 15° be added, it will make $17^{\circ} 8'$; and this set off from K towards Q on the line EQ, will give the point for the hour-line of IV: and so of the rest. — The forenoon hour-lines are drawn the same way, by the continual addition of the tangents 15° , 30° , 45° , &c. to $42^{\circ} 52'$ (= the tangent KM) for the hours of XI, X, IX, &c. as far as necessary; that is, until there be five hours on each side of the substile. The 6th hour, accounted from that hour or part of the hour on which the substile falls, will be always in a line perpendicular to the substile, and drawn through the centre C. 4. In all erect dials, CM, the hour-line of XII, is perpendicular to the horizon of the place for which the dial is to serve; for that line is the intersection of a vertical plane with the plane of the meridian of the place, both which are perpendicular to the plane of the horizon: and any line HO, or ho, perpendicular to CM, will be a horizontal line on the plane of the dial, along which line the hours may be numbered; and CM being set perpendicular to the horizon the dial will have its true position. 5. If the plane of the dial had declined by an equal angle toward the east, its description would have differed only in this, that the hour-line of XII would have fallen on the other side of the substile CL, and the line HO would have a subcontrary position to what it has in this figure. 6. And these two dials, with the upper points of their stiles turned toward the N. pole, will serve for other two planes parallel to them; the one declining from the N. toward the E. and the other from the N. toward the W. by the same quantity of angle. The like holds true of all dials in general, whatever be their declination and obliquity of their planes to the horizon.

RECLINERS. If the plane of the dial not only declines, but also reclines. Suppose its declination from fronting the south S be equal to the arc SD, fig. 20, on the horizon; and its reclination be equal to the arc Dd of the vertical circle DZ: then it is plain, that if the quadrant of altitude Zdd on the globe, cuts the point D in the horizon, and the reclination is counted upon the quadrant from D to d; the intersection of the hour-circle PRd, with the equinoctial WQE, will determine Rd, the latitude of the place d, whose horizon is parallel to the given plane Zh at Z; and RQ will be the difference in longitude of the places at d and Z. Trigonometrically thus: Let a great circle pass through the three points, W, d, E; and in the triangle Wdd, right-angled at D, the sides WD and Dd are given; and thence the angle DWd is found, and so is the hypotenuse Wd. Again, the difference, or the sum, of DWd and DWR, the elevation of the equinoctial above the horizon of Z, gives the angle dWR; and the hypotenuse of the triangle WRd was just now found; whence the sides Rd and WR are found, the former being the latitude of the place d, and the latter the complement of RQ, the difference of longitude sought. Thus, if the latitude of the place Z be $52^{\circ} 30'$ north; the declination SD of the plane Zh (which would be horizontal at d) be 36° , and the reclination be 15° , or equal to the arc Dd; the south latitude of the place d, that is, the arc Rd, will be $15^{\circ} 9'$; and RQ, the difference of the longitude, $36^{\circ} 2'$. From these data, therefore, let the dial, fig. 22, be described, as in the former example. 8. There are several things requisite in the practice of dialing; the chief of which shall be given in the form of arithmetical rules, simple and easy to those who have learned the elements of trigonometry. For in practical arts of this kind, arithmetic should be used as far as it can go; and scales never trusted to, except in the final construction, where they are absolutely necessary in laying down the calculated hour-distances on the plane of the dial. The latitude of the place, the sun's declination, and his hour-distance from the meridian, being given, to find, 1st, his altitude, 2d, his azimuth. 1. Let d, fig. 20, be the sun's place, dR, his declination; and in the triangle PZd, Pd the sum, or the difference, of dR, and the quadrant PR, being given by the supposition, as also the complement of the latitude PZ, and the angle dPZ, which measures the horary distance of d from the meridian; we shall (by spheric trigonometry) find the base Zd, which is the sun's distance from the zenith, or the complement of his altitude. And 2. as sine Zd : sine Pd :: sine dPZ : dZP, or of its supplement DZS, the azimuthal distance from the south. Or the practical rule may be as follows: Write A for the sine of the sun's altitude, L and l for the sine and co-sine of the latitude, D and d for

the sine and co-sine of the sun's declination, and H for the sine of the horary distance from VI. Then the relation of H to A will have three varieties. 9. When the declination is toward the elevated pole, and the hour of the day is between XII and VI; it is

$$A = LD, \text{ and } H = \frac{LD - A}{ld}. \quad 2. \text{ When the hour is after VI, it is } A = LD - Hld, \text{ and } H = \frac{LD - A}{ld}.$$

$$3. \text{ When the declination is toward the depressed pole, we have } A = Hld - LD, \text{ and } H = \frac{A + LD}{ld}.$$

These theorems will be found useful, and expeditious enough for solving those problems in geography and dialing, which depend on the relation of the sun's altitude to the hour of the day.

Example 1. Suppose the latitude of the place to be $51\frac{1}{2}$ degrees north: the time five hours distant from XII, that is, an hour after VI in the morning, or before VI in the evening; and the sun's declination 20° north. Required the sun's altitude?

$$\text{Then to log. } L = \log. \sin. 51^{\circ} 30' = 1.89354 \\ \text{add log. } D = \log. \sin. 20^{\circ} 0' = 1.53405$$

Their sum = 1.42759 gives

LD = logarithm of 0.267664, in the natural sines

$$\text{And, to log. } H = \log. \sin. 15^{\circ} 0' = 1.41300$$

$$\text{add } \left\{ \begin{array}{l} \log. l = \log. \sin. 38^{\circ} 0' = 1.79414 \\ \log. d = \log. \sin. 70^{\circ} 0' = 1.97300 \end{array} \right.$$

Their sum = 1.18014 gives

Hld = logarithm of 0.151408, in the natural sines. And these two numbers (0.267664 and 0.151408) make 0.419072 = A; which, in the table, is the nearest natural sine of $24^{\circ} 47'$, the sun's altitude sought. In these calculations the radius is considered as unity, and not 10,00000, by which, instead of the index 9, we have —1, which only makes the work a little easier. The same hour-distance being assumed on the other side of VI, then LD — Hld is 0.116256, the sine of $6^{\circ} 40\frac{1}{2}'$; which is the sun's altitude at V in the morning, or VII in the evening, when his N. declination is 20° . But when the declination is 20° S. (or towards the depressed pole) the difference Hld — LD becomes negative; and thereby shews, that an hour before VI in the morning, or past VI in the evening, the sun's centre is $6^{\circ} 40\frac{1}{2}'$ below the horizon.

Example II. From the same data, to find the sun's azimuth. If H, L, and D, are given, then from H having found the altitude and its complement Zd: and the arc Pd (the distance from the pole) being given; say, as the co-sine of the altitude is to the sine of the distance from the pole, so is the sine of the hour-distance from the meridian to the sine of the azimuth distance from the meridian. Let the latitude be $51^{\circ} 30'$ north, the declination $15^{\circ} 9'$ S, and the time II h. 24 m. in the afternoon, when the sun begins to illuminate a vertical wall, and it is required to find the position of the wall. Then, by the foregoing theorems, the complement of the altitude will be $81^{\circ} 32\frac{1}{2}'$, and Pd, the distance from the pole being $109^{\circ} 5'$, and the horary distance from the meridian, or the angle dPZ, 36° .

$$\text{To log. sin. } 74^{\circ} 51' = 1.98464 \\ \text{Add log. sin. } 36^{\circ} 0' = 1.76922$$

$$\text{And from the sum} = 1.75386$$

$$\text{Take log. sine } 81^{\circ} 32\frac{1}{2}' = 1.99525$$

Remains = 1.75861 = log. sin.

35° , the azimuth distance sought. When the altitude is given, find from thence the hour, and proceed as above. This praxis is of singular use on many occasions; as, 1. in finding the declination of vertical planes more exactly than in the common way, especially if the transits of the sun's centre are observed by applying a ruler with sights, either plain or telescopic, to the wall or plane whose declination is required: 2. In drawing a meridian-line, and finding the magnetic variation: 3. In finding the bearings of places in terrestrial surveys; the transits of the sun over any place, or his horizontal distance from it, being observed, together with the altitude and hour; and thence determining small differences of longitude: 4. In observing the variations at sea, &c.

OF FINDING THE DECLINATION, INCLINATION, AND RECLINATION, OF PLANES.

The declination, inclination, and reclination, of planes, are frequently taken with a sufficient degree of accuracy by an instrument called a declinator, or declinatory.

The construction of this instrument, as somewhat improved by Mr. Jones, is as follows: On a mahogany board *ABIK*, fig. 23, is inserted a semicircular arc *AGEB* of ivory or box-wood, divided into two quadrants of 90° each, beginning from the middle *G*. On the centre *C* turns a vertical quadrant *DFE*, divided into 90° , beginning from the base *E*; on which is a moveable index *CF*, with a small hole at *F* for the sun's rays to pass through, and from a spot on a mark at *C*. The lower extremity of the quadrant at *E* is pointed, to mark the linear direction of the quadrant when applied to any other plane; as this quadrant takes off occasionally, and a plumb-line *P* hangs at the centre on *C*, for taking the inclinations and reclinations of planes. At *H*, on the plane of the board, is inserted a compass of points and degrees, with a magnetical needle turning on a pivot over it. The addition of the moveable quadrant and index considerably extend the utility of the declinator, by rendering it convenient for taking equal altitudes of the sun, the sun's altitude, and bearing, at the same time, &c. To apply this instrument in taking the declination of a wall, or plane: place the side *ACB*, in an horizontal direction, to the plane proposed, and observe what degree, or point of the compass the *N*. part of the needle stands over from the north, or the south, and it will be the declination of the plane from the north, or south, accordingly. In this case, allowance must be made for the variation of the needle (if any) at the place; and which, if not previously known, will render this operation very inaccurate. At London it is now $22^\circ 30'$ to the west. Another way more exact may be used, when the sun shines out half an hour before noon. The side *ACB* being placed against the plane, the quadrant must be so moved on the semicircle *AGC*, and the index *CF* on *DE*, till the sun's rays passing through the hole at *F* fall exactly on the mark at *G*, and continue so till the sun requires the index to be raised no higher: you will then have the meridian or greatest altitude of the sun; and the angle contained between *G* and *E*, will be the declination required. The position of *CE* is the meridian, or 12 o'clock line. But the most exact way for taking the declination of a plane, or finding a meridian-line, by this instrument, is, in the forenoon, about two or three hours before 12 o'clock, to observe two or three heights or altitudes *EF* of the sun; and at the same time the respective angular polar distances *GE* from *G*: write them down; and in the afternoon watch for the same, or one of the same altitudes, and mark the angular distances, or distance on the quadrant *AG*: Now, the division or degree exactly between the two noted angular distances will be the true meridian, and the

distance at which it may fall from the *C* of the divisions at *G* will be the declination of the plane. The reason for observing two or three altitudes and angles in the morning is, that in case there should be clouds in the afternoon, we may have the chance of one corresponding altitude. The quadrant may be occasionally taken off at *C*, in order to place it on the surface of a pedestal or plane intended for an horizontal dial; and thereby form equal altitudes of the sun, as above, to draw a meridian or 12 o'clock line to set the dial by. The base *ABIK* serves to take the inclination, and reclination of planes. In this case the quadrant is taken off, and the plummet *P* is fitted on a pin at the centre *C*: then the side *IGK* being applied to the plane proposed, as *QL*, fig. 24, of the plumb-line cuts the semicircle in the point *G*, the plane is horizontal; or if it cut the quadrant in any point at *S*, then will *GCS* be the angle of inclination. Lastly, if applying the side *ACB* to the plane, the plummet cuts *G*, the plane is vertical; or if it cuts either of the quadrants, it is accordingly the angle of reclination. Hence, if the quantity of the angle of inclination be compared with the elevation of the pole and equator, it is easily known whether the plane be inclined, or reclined.

OF THE RIGHT PLACING OF DIALS.

The plane on which the dial is to rest being duly prepared, and every thing necessary for fixing it, take the sun's altitude by a good quadrant, noting the precise time of observation by a clock or watch. Then compute the time for the altitude observed; and set your watch to agree with that time, according to the sun. A Hadley's quadrant is very convenient for this purpose: for by it you may take the angle between the sun and his image reflected from a basin of water; the half of which angle, subtracting the refraction, is the altitude required. This is best done in summer; and the nearer the sun is to the prime vertical (the *E*. or *W*. azimuth) when the observation is made, so much the better. Or, take two equal altitudes of the sun in the same day; one any time between seven and ten in the morning, the other between two and five in the afternoon; noting the moments of these two observations by a clock or watch: and if the watch shews the observations to be at equal distances from noon, it agrees exactly with the sun: if not, the watch must be corrected by half the difference of the forenoon and afternoon intervals; and then the dial may be set true by the watch. For example, suppose you had taken the sun's altitude when it was 20 minutes past VIII. in the morning by the watch; and found, by observation in the afternoon, that the sun had the same altitude ten minutes before III; then it is plain, that the watch was five minutes too fast for the sun: for five minutes after XII is the middle time between VIII h. 20 m. in the morning, and III h. 50 m. in the afternoon; and therefore to make the watch agree with the sun, it must be set back five minutes.

DIALING IN A MINE, called also *plumming*, is the using of a compass which the miners call a dial, and a long line, to know which way the load or vein of ore inclines, or where to shift an air-shaft, or bring an adit to a desired place.

DIALING LINES, or DIALING SCALES. See **DIALING**, and Plate LVI. fig. 5.

DIALING SECTOR is a sector having upon it, besides other lines, the dialing lines the construction of which is shewn under dialing. It is evident that some advantage will be obtained in the practice of dialing by having the lines placed on a sector.

DIALING SPHERE, is an instrument made of brass, with several semicircles sliding over one another, on a moving horizon, to demonstrate the nature of the doctrine of spherical triangles, and to give a true idea of the drawing of dials on all manner of planes.

DIALING TRIGON, an instrument invented by the late Mr. Benjamin Martin, consisting of two graduated scales and a plane; used by some in the practice of dialing.

DIALOGISM, in rhetoric, the soliloquy of persons deliberating with themselves. See **SOLILOQUY**.

DIALOGUE, [*dialogos*,] a conference; a conversation between two or more, either real or feigned. As the end of speech is conversation, no kind of writing can be more natural than dialogue, which represents this. Accordingly we find it was introduced very early; for there are several instances of it in the Mosaic history. The ancient Greek writers also fell very much into

it, especially the philosophers, as the most agreeable method of communicating their sentiments and instructions to mankind. Indeed it seems to be attended with very considerable advantages, if judiciously managed. For it is capable of making the driest subjects entertaining and pleasant, by its variety, and the different characters of the speakers. Besides, things may be canvassed more minutely, and many less matters, which serve to clear up a subject, may be introduced with a better grace, by questions and answers, objections and replies, than can be conveniently done in a continued discourse. There is likewise a further advantage in this way of writing, that the author is at liberty to choose his speakers; and therefore, as Cicero has well observed, when we imagine that we hear persons of an established reputation for wisdom and knowledge talking together, it necessarily adds a weight and authority to the discourse, and more closely engages the attention. The subject matter of it is very extensive: for whatever is a proper argument of discourse, public or private, serious or jocose; whatever is fit for wise and ingenious men to talk upon either for improvement or diversion, is suitable for a dialogue. The greatest regard is to be had in the choice of the persons, who ought to be such as are well acquainted with the subject upon which they discourse; in the dialogues of Cicero, the two principal disputants are Crassus and Antony, the greatest orators of that age, and therefore the most proper persons to dispute upon the qualifications necessary for their art. One would think it scarce necessary to observe, that the conference should be held by persons who lived

lived at the same time, and so were capable to converse together. But yet some good writers have run into the impropriety of feigning dialogues between persons who lived at distant times. Plato took this method, in which he has been followed by Macrobius. But others, who have been willing to bring persons to discourse together, who lived in different ages, without such inconsistency, have wrote Dialogues of the Dead.

DIALTHÆA, in pharmacy, an unguent much used as a resolvent; so called from althæa, or marshmallows, which is the principal ingredient in it.

DIALYSIS, [διαλυσις,] the figure in rhetoric by which syllables or words are divided.

DIALYSIS, in grammar, a mark or character, consisting of two points (") placed over two vowels, because otherwise they would make a diphthong, as Mosâic, Phaëton, &c.

DIAMANT, a town of the island of Martinico, on the south coast.

DIAMASTIGOSIS, a festival at Sparta in honour of Diana Orthia, which received that name *απο του μασιγουν*, from whipping, because boys were whipped before the altar of the goddess. These boys, called bomonice, were originally free-born Spartans, but in the more delicate ages they were of mean birth, and generally of a slavish origin.

DIAMETER, [δια and μετρον,] the line, which passing through the centre of a circle or other curvilinear figure, divides it into equal parts.

DIAMETER, in conic sections. See CONIC SECTIONS.

DIAMOND, [*diamant*, Fr. *adamas*, Lat.] the most valuable and hardest of all the gems, is, when pure, perfectly clear and pellucid as the purest water; and is eminently distinguished from all other substances by its vivid splendour, and the brightness of its reflections. It is extremely various in shape and size, being found in the greatest quantity very small, and the larger ones extremely seldom met with. But most commonly it is crystallized in the form of a six-sided prism, terminated by a six-sided pyramid. Its brilliancy arises from its greater refractive power, which is such as to cause all the light to be reflected which falls on it at an angle of incidence greater than $24\frac{1}{2}$ degrees; and it is capable of being rendered still more brilliant by its surface being cut into facets, which multiply the reflections of light. From its hardness its lustre remains uninjured: this hardness is such, that it can be cut, or rather worn down only by rubbing one diamond against another, and is polished only by the finer diamond powder. Diamonds are found in India, in the districts of Visapore, Golconda, Bengal, and the island of Ceylon, and in Brazil in South America. It is not found in its original situation, but in the beds of streams, or in a loose ferruginous sand beneath the soil. The Brazilian diamonds are inferior in transparency and purity to the Oriental. The diamond is colourless, or tinged of various shades of white or grey, and sometimes also, though more rarely, of brown, green, yellow, blue, and red, frequently with darker coloured spots. It is generally transparent, though not perfectly so, and has the property of single refraction; its fracture is lamellated, and it can be split by striking it in the direction of the plates. Its specific gravity is from 3500 to 3600. It is phosphorescent, or, when it has been exposed to the light, is luminous in the dark. It is rendered electrical by rubbing, the electricity being positive. The diamond was long thought to be an incombustible substance since it was found to resist the action of the strongest fires. However, Sir Isaac Newton observing that combustibles refract light more powerfully than other bodies, and that the diamond possesses this property in great perfection, suspected it, from that circumstance, to be capable of combustion. This singular conjecture was verified in 1694 by the Florentine academicians, in the presence of Cosmo III. grand duke of Tuscany. By means of a burning-glass, they consumed several diamonds. Francis I. emperor of Germany, afterwards witnessed the destruction of several more in the heat of the furnace. These experiments were repeated by Rouelle, Macquer, and Darcet; who proved that the diamond was not merely evaporated but actually burnt; and that if air was excluded it underwent no change. No attempt, however, was made to ascertain the product till 1772. Lavoisier, in a memoir published that year, shewed that when the diamond is burnt, carbonic acid gas is obtained, and that there is a striking analogy between it and charcoal. In 1785 Guyton-Morveau found that the diamond is combustible when dropped into melted nitre; that it burns without leaving any resi-

duum, and in a manner analogous to charcoal. This experiment was repeated with more precision by Mr. Tennant in 1797. The conclusion which he drew from it was, that when a diamond is burnt the whole of the product is carbonic acid gas; that a given weight of diamond yields just as much carbonic acid gas as the same weight of charcoal; and that diamond and charcoal are both composed of the very same substance. The conclusion that diamond is nothing else than charcoal, was directly contrary to what one would have expected from comparing the two substances together. Their colour, hardness, specific gravity, and electrical properties, are exceedingly different; nor do they resemble each other more nearly in their combustibility. Charcoal takes fire at a red heat; and when once kindled in oxygen gas continues to burn till it is wholly consumed. According to Morveau, the diamond, before it can be burnt, must be exposed to the sun's rays in the focus of a large burning glass, or to a heat not under 5000° . But Sir George M'Kenzie found that diamonds will burn in a muffle, when heated no higher than 14° or 15° Wedgewood; which must be considerably lower than 5000° Fahrenheit. Its surface assumes a black colour like charcoal: this crust is soon wasted, and another is formed in its place. It was in this manner that a diamond weighing 3.089 grains troy, gradually wasted away completely when exposed by Morveau for one hour and forty minutes in the focus of the celebrated burning glass of Tschirnhausen, while a thermometer exposed to the sun stood at 104° . Morveau found that one part of the diamond during its combustion combines with 4.592 parts of oxygen, and the carbonic acid gas formed amounts to 5.592 parts: consequently, carbonic acid gas is composed of one part of diamond and 4.592 of oxygen; or, which is the same thing, 100 parts of carbonic acid gas are composed of

17.88 diamond

82.12 oxygen

100.00

But Lavoisier, ascertained that one part of charcoal, when burnt, combines with 2.5714 parts of oxygen, and forms 3.5714 parts of carbonic acid gas: consequently 100 parts of carbonic acid gas are composed of

28 charcoal

72 oxygen

100:

But 100 parts of carbonic acid gas are also composed of 17.88 diamond, and 82.12 oxygen. We have therefore this equation:

Diamond. Oxygen. Char. Oxygen.

17.88 + 82.12 = 28 + 72

Consequently, subtracting 72 parts of oxygen from both sides of the equation, we have

Diamond. Oxygen.

17.88 + 10.12 = 28 charcoal.

That is to say, 28 parts of charcoal are composed of 17.88 diamond and 10.12 oxygen. Of course, 100 parts of charcoal are composed of

63.85 diamond

36.15 oxygen

100.00

The diamond, from these experiments, appears to be that substance in a state of purity to which Lavoisier and his associates gave the name of carbon; and therefore charcoal is not carbon, as they supposed, but the oxide of carbon. Thus charcoal is a compound substance, and hence the different qualities of charcoal and carbon, or diamond. See CARBON. Sir George Mackenzie, likewise, repeated and confirmed an experiment of the French chemists, in which a piece of soft iron was converted into steel by being heated with diamonds, in the same manner as it would have been by being heated in the usual manner with charcoal powder; and his experiments are more satisfactory, as having been made with a diamond in its purest state. (Nicholson's Journal, 4to. vol. iv. p. 103.) The first water in diamonds means the greatest purity and perfection of their complexion, which ought to be that of the purest water. When diamonds fall short of this perfection, they are said to be of the second or third water;

&c.

&c. till the stone may be properly called a coloured one: for it would be an impropriety to speak of an imperfectly coloured diamond, or one that has other defects, as a stone of a bad water only. The names of oriental and occidental, given by jewellers to this and all other precious stones, have a different meaning from the obvious sense; the finest and hardest being always called oriental, whether they be produced in the east or not. Those called occidental are of inferior value; but according to Mr. Jefferies, who has written a treatise on the subject, the diamonds of Brasil equal the finest oriental ones. Diamonds are also distinguished according to their figure, by the names of rose diamonds, brilliant, and rough diamonds.

1. **DIAMONDS, BRILLIANT**, are those cut in faces both at top and bottom; and whose table, or principal face at top, is flat. To make a complete square brilliant, if the rough diamond be not found of a square figure, it must be made so; and if the work is perfectly executed, the length of the axis will be equal to the side of the square base of the pyramid. Jewellers then form the table and collet by dividing the block, or length of the axis, into 18 parts. They take five-18ths from the upper part, and one-18th from the lower. This gives a plane at four-18ths from the girdle for the table; and a smaller plane at five-18ths distance for the collet; the breadth of which will be one-5th of the breadth of the table. In this state the stone is said to be a complete square table diamond. The brilliant is an improvement on the table diamond, and was introduced within the last century, according to Mr. Jefferies. To render a brilliant perfect, each corner of the above described table diamond, must be shortened by one-20th of its original. The corner ribs of the upper sides must be flattened, or run towards the centre of the table one-6th less than the sides; the lower part, which terminates in the girdle, must be one-8th of one side of the girdle; and each corner rib of the under sides must be flattened at the top, to answer the above flattening at the girdle, and at bottom must be one-4th of each side of the collet. The parts of the small work, which complete the brilliant, or the star and skill facets, are of a triangular figure. Both of these partake equally of the depth of the upper sides from the table to the girdle; and meet in the middle of each side of the table and girdle, as also at the corners. Thus they produce regular lozenges on the four upper sides, and corners of the stone. The triangular facets, on the under sides, joining to the girdle, must be half as deep again as the above facets, to answer to the collet-parts. The stone here described is said to be a full-substantiated brilliant. If the stone is thicker than in the proportion here mentioned, it is said to be an over-weighted brilliant. If the thickness is less than in this proportion, it is called a spread brilliant. The beauty of brilliants is diminished by their being either over-weighted or spread. The true proportion of the axis, or depth of the stone to its side, is as two to three. Brilliants are distinguished into square, round, oval, and drops, from the figure of their respective girdles.

2. **DIAMONDS, ROSE**, are quite flat underneath, with their upper part cut in divers little faces, usually triangles, the uppermost of which terminate in a point. The depth of the stone from the base to the point must be half the breadth of the diameter of the base of the stone. The diameter of the crown must be two-5ths of the diameter of the base. The perpendicular, from the base to the crown, must be three-5ths of the diameter of the stone. The lozenges which appear in all circular rose diamonds, will be equally divided by the ribs that form the crown; and the upper angles or facets will terminate in the extreme point of the stone, and the lower in the base or girdle.

3. **DIAMONDS, ROUGH**, are the stones, as nature produces them in the mines. They should be chosen uniform, of a good shape, transparent, not quite white, and free of flaws and shivers. Black, rugged, dirty, flawey, veiny stones, and all such, are not fit for cutting, they use to pound in a steel mortar made for that purpose; and when pulverized, they serve to saw, cut, and polish, the rest. Shivers are occasioned in diamonds by this, that the miners, to get them more easily out of the vein, which winds between two rocks, break the rocks with huge iron levers, which shakes, and fills the stone with cracks and shivers. Lewis Berquen, a native of Bruges, in 1476, invented the art of cutting diamonds. The diamond is so hard, that it can only be cut and ground by itself and its own substance. To bring it to that perfection which augments its price so considerably, they begin by rubbing several against each other, while rough; after having fixed them to the

ends of two wooden blocks, thick enough to be held in the hand, with a mixture of rosin and brick dust. It is this powder, thus rubbed off the stones, and received in a little box for the purpose, that serves to grind and polish the diamonds. This is done by means of a mill, which turns a wheel of soft iron, sprinkled over with diamond dust mixed with oil of olives. The same dust, well ground, and diluted with water and vinegar, is used in the sawing of diamonds; which is performed with an iron or brass wire, as fine as a hair. Sometimes, in lieu of sawing the diamonds, they cleave them, especially if there be any large shivers therein. But the Europeans are not usually daring, or expert enough to run the risk of cleaving, for fear of breaking. The greatest diamond ever known in the world belongs to the king of Portugal, and was found in Brazil. It is still uncut; and Mr. Magellan informs us, that it was of a larger size; but a piece was broken off by the ignorant countryman, who chanced to find this great gem, and tried its hardness by the stroke of a large hammer upon an anvil. This prodigious diamond weighs 1680 carats; and although it is uncut, Mr. Rome de l'Isle says that it is valued at 224 millions sterling, which gives the estimation of 79.36, or about 80*l.* sterling for each carat; viz. for the multiplicand of the square of its whole weight. But even in case of any error of the press in this valuation, if we employ the general rule of valuation, this great gem must be worth at least 5,644,800*l.* sterling, which are the product of 1680 by two pounds, viz. much above five millions and a half sterling. The famous diamond, which adorns the imperial sceptre of Russia under the eagle at the top of it, weighs 779 carats, and is worth at least 4,854,728*l.* sterling, although it hardly cost 135,417 guineas. This diamond was one of the eyes of a Malabarian idol, named Scheeringham. A French grenadier, who had deserted from the Indian service, contrived to become one of the priests of that idol, from which he had the opportunity to steal one of its eyes: he then ran away to the English at Trichinapetty, and thence to Madras. A ship's captain bought it for 20,000 rupees: afterwards a Jew gave 17, or 18,000*l.* sterling for it: at last a Greek merchant, named Gregory Suffras, offered it to sale at Amsterdam, in 1766: and the late prince Orloff purchased it, as he himself told Mr. Magellan in London, for the empress Catharine II. The figure and size of this diamond may be seen in the British Museum in London: it is not of a regular form. For the valuation of diamonds of all weights, Mr. Jefferies lays down the following rules. He first supposes the value of a rough diamond to be 2*l.* per carat, at a medium; then to find the value of diamonds of greater weights, multiply the square of their weight by two, and the product is the value required. E. G. to find the value of a rough diamond of two carats, $2 \times 2 = 4$, the square of the weight; which, multiplied by two, gives 8*l.* the true value of a rough diamond of two carats. For finding the value of manufactured diamonds, he supposes half their weight to be lost in manufacturing them: and therefore to find their value, we must multiply the square of double their weight by two, which will give their true value in pounds. Thus, to find the value of a wrought diamond weighing two carats; we first find the square of double the weight, viz. $4 \times 4 = 16$; then $16 \times 2 = 32$. So that the true value of a wrought diamond of two carats is 32*l.* On these principles Mr. Jefferies has constructed tables of the price of diamonds from 1 to 100 carats.

DIAMOND, in the glass trade, an instrument used for squaring the large plates, or pieces; and, among glaziers, for cutting their glass. These sorts of diamonds (which are small broken pieces of real diamonds) are differently fitted up. Those used for large pieces, as looking-glasses, &c. are set in an iron ferril, about two inches long, and a quarter of an inch in diameter; the cavity of the ferril being filled up with lead, to keep the diamond firm: there is also a handle of box or ebony fitted to the ferril, for holding it by.

DIAMOND, in heraldry, a term used for expressing the black colour in the achievements of peerage. Guillim does not approve of blazoning the coats of peers by precious stones instead of metals and colours; but the English practice allows it. Morgan says the diamond is an emblem of fortitude.

DIAMPER, or **UDEAMPER**, a town of India, in the country of Cochín, said to be inhabited by Christians of St. Thomas, 13 miles W. of Cochín.

DIANA, the goddess of hunting. According to Cicero, there were three of this name: a daughter of Jupiter and Proserpine, who became mother of Cupid; a daughter of Jupiter and Latona; and

and a daughter of Upis and Glauce. The second is the most celebrated, and to her all the ancients allude. She was born at the same birth as Apollo; and the pains which she saw her mother suffer during her labour, gave her such an aversion to marriage, that she obtained of her father to live in perpetual celibacy, and, to preside over the travails of women. To shun the society of men she devoted herself to hunting; and was always accompanied by a number of chosen virgins, who, like herself, abjured marriage. She is represented with a quiver, and attended with dogs, and sometimes drawn in a chariot by two white stags. Sometimes she appears with wings, holding a lion in one hand, and a panther in the other, with a chariot drawn by two heifers, or two horses of different colours, is represented as tall, her face has something manly; her legs are bare, well-shaped, and strong; and her feet are covered with a buskin worn by huntresses among the ancients. She received many surnames, particularly from the places where her worship was established, and from the functions over which she presided. She was called *Lacina*, *Ilythia*, or *Juno Pronuba*, when invoked by women in child-bed; and *Trivia* when worshipped in the cross-ways, where her statues were generally erected. She was supposed to be the same as the moon and Proserpine, or Hecate; hence she was called *Triformis*; and some of her statues represented her with three heads, that of a horse, a dog, and a boar. Her powers and functions under these three characters have been expressed in these lines:

Terret, lustrat, agit, Proserpina, Luna, Diana,

Ima suprema, feras, scepro, fulgore, sagittâ.

She was also called *Agrotera*, *Orithia*, *Taurica*, *Delia*, *Cynthia*, *Aricia*, &c. She was reckoned the same as the *Isis* of the Egyptians, whose worship was introduced into Greece with that of *Osiris* under the name of *Apollo*.

DIANÆ ARBOR, or **ARBOR LUNÆ**, in chemistry, the beautiful crystallizations of silver dissolved in aqua-fortis, to which some quicksilver is added; and so called from their resembling the trunk, branches, leaves, &c. of a tree. See **ARBOR DIANÆ**.

DIANDRIA, [from *di*, twice, and *andros*, a man,] the second class in Linnaeus's sexual system, consisting of hermaphrodite plants, which have flowers with two male organs. See **BOTANY**.

DIANIUM, in ancient geography, a town of the Contestani, in the Hither Spain; now called *Denia*.

DIANTHERA, in botany, a genus of the monogynia order, and diandria class of plants; natural order, *Personatæ*. Corolla ringent; capsule bilocular, parting with a spring at the heel; stamina, each furnished with two antheræ placed alternately. Twelve species.

DIANTHUS, the **CLOVE-GILLIFLOWER**, **CARNATION**, **PINK**, **SWEET-WILLIAM**, &c.; a genus of the digynia order, and decandria class of plants; natural order, *Carophyllei*. Calyx cylindric, one-leaved, with four-scales at the base; petals five, with claws; capsule cylindric, one-celled. There are thirty species. These beautiful plants are chiefly herbaceous; some few however are suffruticose. Most of them are hardy, and perennial or biennial; some of the smaller wild sorts only are annual; stalks annual, from one to three feet in height; leaves opposite, narrow, entire; flowers terminating, many aggregate, some solitary, or several together, but distinct. This numerous genus includes the sweet-williams, carnations, and pinks, with their several varieties.

DIAPASON, [*δια πασων*,] in music, a musical interval, by which most authors, who have wrote upon the theory of music, use to express the octave of the Greeks. See **OCTAVE**. The diapason is the first and most perfect of the concords; if considered simply, it is but one harmonical interval; though, if considered diatonically, by tones and semitones, it contains seven degrees, viz. the three greater tones, two less tones, and two greater semitones. The interval of a diapason, that is the proportion of its grave sounds to its acute, is duplicate, i. e. as 2 : 1. See the article **INTERVAL**, and **MUSIC**.

DIAPASON, among the musical instrument makers, a kind of scale whereby they adjust the pipes of their organs, and cut the holes of their hautboys, flutes, &c. in due proportion for performing the tones, semi-tones, and concords, just.

DIAPASON DIAEX, a kind of compound concord, whereof there are two sorts; the greater, which is in the proportion of 10-3; and the less in that of 16-5.

DIAPASON DIAFENTE, a compound consonance in a triple ratio, as 3-9. This interval, says *Martianus Capella*, consists of 9

tones and a semitone; 19 semitones, and 38 dieses. It is a symphony made when the voice proceeds from the first to the twelfth sound.

DIAPASON DIATESSARON, a compound concord founded on the proportion of 8 to 3. To this interval *Martianus Capella* allows 8 tones and a semitone; 17 semitones, and 34 dieses. This is when the voice proceeds from its first to its 11th sound. The moderns would rather call it the 11th.

DIAPASON DITONE, a compound concord, whose terms are as 10-4, or as 5-2.

DIAPASON SEMIDITONE, a compound concord, whose terms are in the proportion of 12-5.

DIAPÉDESIS, in medicine, a transudation of the fluids through the sides of the vessels that contain them, occasioned by the blood's becoming too much attenuated, or the pores too open.

DIAPENSIA, a genus of the monogynia order, and pentandria class of plants; natural order, *Preciæ*. Corolla salver-shaped; calyx five-leaved, imbricate, with three other leaflets; stamina placed on the tube of the corolla; capsule three-celled. There is but one species, viz. *D. laponica*, a native of the mountains of Lapland.

DIAPENTE, in the ancient music, an interval marking the second of the concords; and, with the diatessaron, an octave. This is what in the modern music is called a fifth.

DIAPERED, or **DIAPRE'**, in heraldry, the dividing of a field in planes, like fret-work, and filling the same with variety of figures.

DIAPHORESIS, in medicine, an elimination of the humours in any part of the body through the pores of the skin. See **PERSPIRATION**.

DIAPHANOUS, [*διαφανης*,] an appellation given to all transparent bodies, or such as transmit the rays of light.

DIAPHORETICS, among physicians, all medicines which promote perspiration.

DIAPHRAGM, in anatomy, a large, robust, musculous membrane of skin, placed transversely in the trunk, and dividing the thorax from the abdomen, whence the Latin writers call it *septum transversum*. See **ANATOMY**. Plato, as *Galen* informs us, first called this muscle diaphragm, from the verb, *διαφραττω*, to separate or be between two. Till his time it had been called *πνευγ*, from a notion that an inflammation of this part produced phrensy.

DIAPORESIS, [*διαπορησις*,] in rhetoric, a figure used to express the hesitation or uncertainty of the speaker. It is most naturally placed in the exordium of a discourse. See **DOUBTING**. We have an example in *Homer*, where *Ulysses*, going to relate his sufferings to *Alcinoüs*, begins thus:

Τὴν πρώτην, τί δ' ἔπειτα, τί δ' ὕστατον, καταλέξω.

Quid primum, quid deinde, quid postremo, alloquar?

DIARBECK, **DIARBEKAR**, **DIARBEKER**, or **DIARBEKIR**, an extensive province of Eastern Asiatic Turkey, comprehending, in its latest extent, *Diarbekir*, properly so called, *Yerack* or *Chaldea*, and *Curdistan*, which were the ancient countries of *Mesopotamia*, *Chaldea*, and *Assyria*, with *Babylon*. It is called *Diarbeck*, *Diarbekir*, or *Diarbekr*, as signifying the duke's country, from the word *dhvar*, a duke, and *bekr*, country. It extends along the banks of the *Tigris* and *Euphrates* from N. N. W. to S. E. that is, from *Mount Taurus*, which divides it from *Turcomania* on the N. to the inmost recess of the *Persian gulph* on the S. about 600 miles; and from E. to W. i. e. from *Persia* on the E. to *Syria* and *Arabia Deserta* on the W. in some places 200, and in others about 300 miles, but in the southern or lower parts not above 150 miles. It enjoys a good temperature of air, as well as, in the greater part of it, a rich and fertile soil. There are indeed, as in all hot countries, some large deserts in it, which produce no sustenance for men or cattle, nor have any inhabitants. Being a considerable frontier towards the kingdom of *Persia*, it is very well guarded and fortified; but as for those many cities once so renowned for their greatness and opulence, they are at present almost dwindled into heaps of ruins. *Bagdad*, *Mossul*, *Carahmed*, and a few more, indeed continue populous and wealthy; but the rest are sorry places. The rivers *Euphrates* and *Tigris* have almost their whole course through this country.

DIARBEKIR, or **DIARBECK PROPER**, is bounded on the N. by *Turcomania*, on the W. by *Syria*, on the S. by part of *Arabia Deserta* and *Yerack Proper*, and on the E. by *Curdistan*. It was named by *Moses Padan-Aram*; the latter being the general name

of Syria, and the former signifying fruitful, a proper epithet for this country, which is really so to a very high degree, especially on the N. side, where it yields corn, wine, oil, fruits, and all the necessities of life, in great abundance. The principal towns are, Diarbekir, Rika, Moussul, Orsa, or Edessa, Elbir, Nisibis, Gezir Merdin, Zibin, Ur of the Chaldees, Amad, and Carasara. Diarbekir, the capital, is 600 miles N. W. of Ispahan, and 540 E. S. E. of Constantinople.

DIARRHŒA, [*diarrhœa*,] in medicine, is a frequent and copious evacuation of liquid excrement, by stool. See **MEDICINE**.

DIARY, [*diarium*, Lat.] an account of the transactions, accidents, and observations, of every day; a journal.

DIASCHISM, among musicians, denotes the difference between the comma and enharmonic diesis, commonly called the less comma.

DIASCORDIUM, in pharmacy, a celebrated composition, so called from scordium, one of its ingredients.

DIASIA, [*Διασία*,] in antiquity, a festival held at Athens, in honour of Jupiter.

DIASTOLE, [*διαστολή*,] among physicians, signifies the dilatation of the heart, auricles, and arteries; and stands opposed to the systole, or contraction of the same parts. See **ANATOMY**.

DIASTOLE, in grammar, a figure of prosody, whereby a syllable naturally short is made long: such is the first syllable of *Priamides*, in the following verse of Virgil.

Atque hic Priamides: nihil o tibi, amice relictum.

This figure is used either out of mere poetic licence without any necessity for so doing, or through necessity, for the sake of the verse; as when three or more short syllables follow each other in hexameter verse.

DIASTYLE, [*δια* and *στυλος*,] a pillar, in architecture, a sort of edifice where the pillars stand at such a distance from one another, that three diameters of their thickness are allowed for intercolumniation.

DIASYMUS, in rhetoric, a kind of hyperbole, being an exaggeration of some low, ridiculous thing.

DIATESSERON, [of *δια* and *τεσσαρες*, four] an interval in music, composed of one greater, one less, and one greater semitone; its proportion being as 4 to 3. It is called, in musical composition, a perfect fourth.

DIATHESIS, [*διαθεσις*, i. e. disposition] the natural or preternatural disposition of the body. "This term, says Mr. Chambers, is used by some writers in the same sense with constitution; and by others, for a disposition of the blood to a faulty state."

DIATHYRUM, [from *δια* and *θυρα*, a door,] in architecture, a fence before a door.

DIATONI, [*διατονοι*,] corner-stones.

DIATONIC, in music, is compounded of two Greek words, viz. the preposition *δια*, signifying a transition from one thing to another, and the substantive *τονος*, importing a given degree of tension and musical note. It is indifferently applied to a scale or gamut, to intervals of a certain kind, or to a species of music, whether in melody or harmony, composed of these intervals. See **INTERVAL**.

DIATRETE, in Roman antiquity, a kind of cups and vases made of the purest rock crystal, and esteemed of great value, being engraved with various devices.

DIATRAGACANTH, in pharmacy, a name applied to certain powders, of which gum tragacanth is the chief ingredient.

DIATRIBA, or **DIATRIBE**, a continued discourse; a place where disputations are held.

DIATRIBUS, a composition of three ingredients.

DIATYPOSIS, [*διατυπωσις*,] in rhetoric, a lively description of any thing.

DIABOLO, an island in the Archipelago.

DIAZEUtic TONE, [of *δια* and *ευνωω*,] in the ancient Greek music, disjoined two-fourths, one on each side of it; and which being joined to either, made a fifth. This is, in our music from A to B. They allowed to this diazeutic tone, which is our Ia, Mi, the proportion of nine to eight, as being the unalterable difference of the fifth and fourth.

DIBBLE, or **DIBBER**, a simple but useful implement in gardening, for the purpose of setting out young plants, &c. Within these few years, it has been employed for dibbling wheat, and the whole process consists in making perpendicular holes an inch and a half or two inches deep, in the same manner as is usually

done in planting potatoe-roots. These holes are made by a man who has a proper staff, shod with iron, in each hand; and, as he walks backwards, is able, by looking at the part of the row already formed, to keep nearly in a strait line, and to make two holes at once, about four inches distant from set to set in the rows. Two or more children attend him, and drop two, three, or four seeds into every hole, which are afterwards covered by drawing over them what is called a bush-harrow. This method is deservedly considered one of the greatest improvements in agriculture. It appears to have originated from the planting of grain in a garden, from mere curiosity, by persons who neither designed, nor had any opportunity of extending it to a lucrative purpose. Nor was it attempted on a larger scale, till an industrious farmer, in the vicinity of Norwich, began to-dibble on less than an acre of land. The success of this experiment induced others to follow his example, and notwithstanding the ridicule they incurred for adopting so singular a practice, their crops were not only larger, but likewise so much superior to those of others, that dibbling has become the practice of every intelligent agriculturist in Norfolk, whence it has spread into several other countries.

DICE, among gamblers, cubical pieces of bone or ivory, marked with dots on each side of their faces, from one to six. Sharpers have several ways of falsifying dice.

DICERA, a genus of the polyandria monogynia class and order. Petals four or five, ovate and trifid; nectarium four or five emarginate corpuscles; anthers two, horned. It has two species, trees of New Zealand.

DICHONDRIA, a genus of the class and order pentandria digynia. Calyx five-leaved; corolla rotate, inferior; capsule dicoccus. One species, an herb of New Zealand.

DICHORD, [*δις*, and *χορδή*,] the name given to the two-stringed lyre, said to have been invented by the Egyptian Mercury. Apollodorus accounts for its invention in the following manner. "Mercury," says he, "walking on the banks of the river Nile, happened to strike his foot against the shell of a tortoise, the flesh of which had been dried away by the heat of the sun, and nothing left of its contents but the nerves and cartilages; he was so pleased with the sound it produced, that he hence conceived the idea of a lyre, which he afterwards constructed in the form of a tortoise, and strung it with the dried sinews of animals."

DICHOTOMY, [*διχοτομία*,] a term used by astronomers for that appearance on the moon, wherein she is bisected, or shews just half her disk. In this situation the moon is said to be in a quadrate aspect, or to be in her quadrature, and is thus represented by astronomers: ☐ ⊙ ☐

DICKER, [*dicra*, low Latin,] in old writers, the quantity of ten hides. It was also applied to other articles; as ten pair of gloves, ten bars of iron, and the like.

DICKSONIA, in botany, a genus of the cryptogamia filices class and order. Natural order filices, or ferns. Fructifications kidney-shaped, lying under the edge of the frond at the lower surface; outer valve formed of the substance of the leaf itself; inner membranaceous; involucre double, one from the surface, opening outwards; the other from the inflated margin of the frond, often embracing the former, opening inwards. There are thirteen species. *D. arborescens*, tree dicksonia, was found by Sir Joseph Banks in the island of St. Helena. It flowers most part of the winter.

DICRA, in old records, ten.

DICRANIUM, in botany, a genus of the class and order cryptogamia musci. Capsule ovate, oblong; fringe simple, of sixteen infected, cloven teeth. This is a very numerous genus.

DICRICH, a town of France, in the late Austrian Netherlands, and province of Luxemburg, 15 miles N. of Luxemburg.

DICTAMNUS, **WHITE DITTANY**, or **FRAXINELLA**, a genus of the monogynia order, and decandria class of plants; natural order, Multisiliquæ. Calyx pentaphyllous; petals five, patulous; filaments sprinkled with glandulous points; the capsules five, coalited. It has two species. They are very ornamental plants, and succeed in any of the common borders. The dittany which grows in Crete, Dalmatia, and the Morea, formerly constituted an article in the *Materia Medica*. The leaves in smell and taste somewhat resemble lemon thyme, but have more of an aromatic flavour, as well as a greater degree of pungency; when fresh, they yield a considerable quantity of essential oil.

DICTATE, [*dictamen*, Lat.] among schoolmen, a motion, or suggestion

suggestion of a man's conscience, contrary to which if any action is performed, it is properly termed a bad one, even if the consequences should prove otherwise. See CONSCIENCE.

DICTATE, [*dictata*, Lat.] is also used in the schools for the lecture of a master, which the scholars take down in writing; whence this act of the master is termed dictating.

DICTATOR, in the polity of the ancient Romans, a magistrate invested with sovereign and even arbitrary power. He had power of life and death: also to raise or disband troops, make war or peace, and that without the consent either of the senate or people; or being accountable for his proceedings. He was elected by one of the consuls in the night-time on the frontiers of the commonwealth, and no where else; and the ordinary duration of his office was only for six months, during which time all other magistracies ceased, the tribunship excepted. Whenever he appeared in public, he was attended by twenty-four lictors, or double the number allowed a consul. However, notwithstanding all this power, he could not go out of Italy, or even ride on horseback during a march, without leave from the people. This office was accounted the safeguard of the commonwealth for four hundred years together, till Sylla and Cæsar, by assuming the title of perpetual dictators, converted it into tyranny, and rendered the very name odious.

DICTION, the phrase, elocution, or style, of a writer, or speaker. It is required that the diction, or language, of an orator, should be pure, proper to the subject, rich without affectation, strong and close without dryness, and suitable to the person, time, place, and audience.

DICTIONARY, a collection, or catalogue, of all the words of a language, art, science, &c. with their explanations, ranged in alphabetical order. A performance of this kind being a digest of the body of learning, or, rather, of general knowledge, is thought capable of being made universally useful and instructive; and as the objects of our knowledge grow daily more numerous, and improvements in arts and sciences are continually made, a work of this kind is continually capable of new improvements. It is farther advanced, that besides preventing, in some measure, the necessity and expence of a multitude of books, which too frequently retard rather than promote, and bewilder rather than guide in the pursuit of knowledge, there is no form or method of writing so advantageously disposed to propagate knowledge through the body of a people, or that can be made to comprehend so great a part of the circle of learning, and so well answer the purposes of a library, as a dictionary of this nature. The writers of a dictionary of arts and sciences, are exempted from the observation of certain laws concerning property; never pretending to build entirely upon their own foundation, or treat at their own expence, being privileged to raise contributions for the public service wherever they can do it to the best advantage. In effect, their quality as dictionarists, or collectors, give them a title to every thing that may suit their purpose, without rendering them liable to the imputation of plagiarism. Their merit, therefore, chiefly consists in selecting, abridging, and disposing, their materials, in the most advantageous manner for public utility.

DICTYMNIA, or DICTYNNA, in antiquity, feasts celebrated at Lacedæmon and in Crete, in honour of Diana, or of a nymph taken for her, who, having plunged herself into the sea, to escape the passion of Minos, was caught in a fisherman's net or *dictyon*, whence the name.

DIDACTIC, or DIDACTICAL, [*didaktikós*,] in the schools, signifies the manner of speaking, or writing, adapted to teach or explain the nature of things. There are many works, ancient and modern, both in prose and verse, written after this method: such are Horace "De Arte Poeticâ," Lucretius's poem "De Rerum Naturâ," Pope's "Essays on Criticism and on Man," &c. &c.

DIDELPHIS, the OPOSSUM, in zoology, a genus of the class mammalia, and order feræ. Teeth small and rounded; upper, ten; intermediate two, longer; lower eight; intermediate two, broader and very short; tusks long; grinders denticulated; tongue fringed with papillæ; abdominal pouch, in most species, containing the teats. There are 21 species first known since the discovery of America. The female has a bag or pouch in the lower part of the abdomen, which is opened and closed at pleasure, and to which her young resort for shelter and security in a variety of dangers. Some females possess, according to Gmelin,

two or three of these pouches, and the male is stated also, in the same author, occasionally to have one. These animals live in the woods, burrowing in the earth, and, by means of a prehensile tail, are alert in climbing trees. Their general motion is slow, and their food consists of insects, worms, and vegetables, young birds, and particularly poultry. They are by no means peculiar to the Western continent, but are to be found in various other parts of the world.

D. CANCRIVORA, the CRAB-EATER of Buffon, or the CAYENNE OPOSSUM, has a long slender face: ears erect, pointed, and short; the coat woolly, mixed with very coarse hairs, three inches long; tail very long, taper, naked, and scaly. Length 17 French inches; of the tail 15½. The subject measured was young. It inhabits Cayenne; is very active in climbing trees, on which it lives the whole day: in marshy places, it feeds on crabs, which, when it cannot draw out of their holes with its feet, it hooks them by means of its long tail. If the crab pinches its tail, the animal sets up a loud cry, resembling the human voice, which may be heard afar; but its common voice is a grunt like a young pig. It is well furnished with teeth, and will defend itself stoutly against dogs; brings forth four or five young, which it secures in some hollow tree. The natives eat these animals, and say their flesh resembles that of a hare.

D. CAUDIVOLVULA, or the NEW HOLLAND OPOSSUM, has the upper part of the head, and the back and sides, covered with long, soft, glossy hairs, of a dark cinereous colour at the bottoms, and of a rusty brown towards the ends: the belly is of a dirty white.

D. GIGANTEA, the KANGUROO. This animal has a small head, neck, and shoulders; the body increasing in thickness to the rump. The head is oblong, formed like that of a fan, and tapering from the eyes to the nose; end of the nose naked, black; the upper lip divided. The nostrils are wide and open; the lower jaw is shorter than the upper; and the aperture of the mouth small: there are whiskers on both jaws, those on the upper longest. The belly is convex and great. The fore legs are very short, scarcely reaching to the nose; and useless for walking. The hind legs are almost as long as the body; and the thighs are very thick: on the fore feet are five toes, with long conic and strong claws; on the hind feet, only three: the middle toe is very long and thick, like that of an ostrich; the two others are placed very distinct from it, and are small: the claws are short, thick, and blunt: the bottom of the feet, the hind part, black, naked, and tuberculated, as the animal rests often on them. The tail is very long, extending as far as the ears; thick at the base, tapering to a point. See Plate LXVI.

D. MACULATA, the QUOLL, or SPOTTED OPOSSUM, is described as in length from the nose to the beginning of the tail about 15 inches, and the tail about 9 or 10. The general colour is black, inclining to brown beneath; the neck and body, spotted with irregular roundish patches of white; the ears pretty large and erect; the visage pointed, the muzzle furnished with long slender hairs; the legs, from the knees downward, always naked, and ash-coloured; on the fore feet are five claws, and on the hind, four and a thumb without a claw; the tail, for about an inch and an half from the root, is covered with hairs of the same length as those on the body, from thence to the end with long ones not unlike those of a squirrel. The female has six teats placed in a circle within the pouch. See Plate LXVI.

D. MURINA, the MURINE OPOSSUM, has the face and upper parts of the body of a tawny colour; the belly of a yellowish white: the tail is slender, and covered with minute scales to the very rump: the length of the animal from nose to tail, is about six inches and a half; the tail of the same length. See Plate LXVI.

D. OPOSSUM, the SARIGUE of Buffon, or MOLUCCA OPOSSUM of Pennant, has long, oval, and naked ears: the mouth is very wide: the lower side of the upper jaw, throat, and belly, is of a whitish ash-colour; the rest of the hair a cinereous brown tipped with tawny, darkest on the back: the tail is as long as the body; near the base covered with hair; the rest naked: the claws are hooked. Marcgrave found six young within the pouch of the female. Over each eye is an oblong white spot. The length of the animal from nose to tail is ten inches; and the tail exceeds the length of the head and body. Its whole figure is of a slender and elegant make. This species is found in great numbers in Arôe and

and Solor: it is called in the Indies pelandor Aroe, or the Aroe rabbit. They are reckoned very delicate eating; and are very common at the tables of the great, who rear the young in the same places in which they keep their rabbits. It inhabits also Surinam, and the hot parts of America.

D. TRIDACTYLA, PHILLIP'S OPOSSUM, or the KANGAROO RAT, is described as similar, both in the general shape of the body and the conformation of the legs, to the kangaroo; but the visage having a strong resemblance to that of the rat, and the colour of the whole not ill resembling that animal, it has obtained the name of the kangaroo rat. It is an inhabitant of New Holland.

D. VOLANS, the FLYING OPOSSUM, a beautiful species, and clothed with fur of the most exquisite texture, is an inhabitant of New South Wales. In length, from the tip of the nose to the root of the tail, it is 20 inches; the tail itself is twenty-two inches, at the base quite light, increasing gradually to black at the end: the ears are large and erect: the coat or fur is of a rich and most delicate texture; appearing, on the upper parts of the body at first sight, of a glossy black, but on a nicer inspection is found to be mixed with grey; the under parts are white, and on each hip is a tan-coloured spot nearly as big as a shilling; at this part the fur is thinnest, but at the root of the tail it is so rich and close that the hide cannot be felt through it. The fur is also continued to the claws. On each side of the body is a broad or flat membrane (as in the flying squirrels,) which is united to both the fore and hind legs. See Plate LXVI.

DIDELTA, a genus of the class and order syngenesia polygamia frutraneta. Calyx expanding; receptacle honey-combed dividing into parts, which retain the seeds; down chaffy, many-leaved. There are two species, annuals of the Cape.

DIDO, or **ELISA**, a daughter of Belus king of Tyre, who married Sichæus or Sicharbas her uncle, priest of Hercules. Her brother, Pygmalion, who succeeded Belus, murdered Sichæus to get possession of his immense riches; and Dido, disconsolate for the loss of her husband, whom she tenderly loved, and by whom she was equally esteemed, set sail in quest of a settlement with a number of Tyrians, to whom the cruelty of the tyrant became odious. According to some accounts, she threw into the sea the riches of her husband which Pygmalion so greedily desired, and by that artifice compelled the ships to fly with her that had come by order of the tyrant to obtain the riches of Sichæus. But it is more probable that she carried the riches along with her, and by their powerful influence prevailed on the Tyrian tars to follow her. During her voyage, Dido visited the coast of Cyprus; where she carried away fifty prostitutes, and gave them as wives to her Tyrian followers. A storm drove her fleet on the African coast, where she bought of the inhabitants as much land as could be surrounded by a bull's hide cut into thongs. Upon this land she built a citadel called Byrsa; and the increase of population, and the rising commerce among her subjects, soon obliged her to enlarge her city and the boundaries of her dominions. Her beauty, as well as the fame of her enterprise, gained her many admirers; and her subjects wished to compel her to marry Iabas king of Mauritania, who threatened them with a dreadful war. Dido begged three months to give her decisive answer; and during that time she erected a funeral pile, as if wishing by a solemn sacrifice to appease the manes of Sichæus, to whom she had promised eternal fidelity. When all was prepared, she stabbed herself on the pile in presence of her people; and by this uncommon action obtained the name of Dido, "valiant woman," instead of Elisa. According to Virgil and Ovid, the death of Dido was caused by the sudden departure of Æneas; of whom she was deeply enamoured, and whom she could not obtain as a husband. This poetical fiction represents Æneas as living in the age of Dido, and introduces an anachronism of near 300 years. Dido left Phenicia 247 years after the age of Æneas, and about B. C. 953. This chronological error proceeded not from the ignorance of the poets, but from a voluntary fiction. While Virgil describes, in a beautiful episode, the desperate love of Dido, and the submission of Æneas to the will of the gods, he traces the origin of the hatred which existed between the republics of Rome and Carthage, from their very first foundation, and pretends that it was kindled by a more remote cause than the jealousy and rivalry of two flourishing empires. Dido after her death was honoured as a deity by her subjects.

DIDUS, or **DODO**, in ornithology, a genus of the order gallinae. Bill contracted in the middle by two transverse rugæ; each mandible inflected at the point; face is bare behind the eyes. It has three species.

D. INEPTUS, the DRONTE of Buffon, or HOODED DODO, is somewhat bigger than a swan, and near three feet in length. The bill is strong, large, and hooked at the end; the gape stretches beyond the eyes: the colour is a very pale blue; except the end of the upper mandible, which is yellowish, and a red spot on the bend of it; the end of the lower is blackish; the irides are white. The plumage is soft to the touch. The head is large, and seems as if it were covered with a black hood or cowl. The wings are very short, and of a yellowish ash-colour: the tail feathers are curled, stand up on the rump, and incline to yellow. It inhabits the islands of Mauritius and Bourbon in the Indian Ocean. See Plate LVIII.

D. NAZARENUS, the NAZARENE DODO is bigger than a swan. The bill is a little bent downwards and large: instead of feathers, the whole is covered over with a black down; but the wings are feathered, and it has some frizzled ones upon the rump, which serve instead of a tail: the legs are long and scaly, and there are three toes on each foot.

D. SOLITARIUS, the SOLITAIRE of Buffon, or SOLITARY DODO, is a large bird, and the male is said to weigh sometimes 45 pounds. The neck is of a proportionable length, and the eye black and lively: the head is not crested, and the general colour of the plumage is grey and brown mixed: it has scarce any tail, and the bastard wing swells out into a round knob: the wings are too short for flight; and the hind parts are rounded like a horse's rump, being clothed with feathers, which may be termed coverts. The females are covered with sometimes brown and sometimes light yellow feathers, and appear very beautiful. They are chased in the winter season, viz. from March to September; being then fat, and the young birds are much esteemed for the table.

DIDYNAMIA, [from *dis*, twice, and *δυναμις*, power,] the name of the 14th class in Linnaeus's sexual method; consisting of plants with hermaphrodite flowers, which have four male organs, two long and two short. See BOTANY.

DIE, in geography, a town of France, in the department of Drome, 24 miles S. E. of Valence.

DIEGEM, a town of France, in the department of Dyle, 3 miles N. of Brussels.

DIEGO DE RAMIRES, an island near the coast of Terra del Fuego, S. S. W. of Cape Horn.

DIEGO GARCIAS, or **CHAGAS**, an island of Africa, in the Indian sea. Lon. 68. 10. E. Lat. 8. 45. S.

DIEGO RIAS, or **RODRIGUEZ**, an island of Africa, in the Indian ocean, 100 leagues E. from the island of Mauritius. Lon. 57. 32. E. Lat. 19. 30. S.

DIEGO SOUREZ, an island in the Indian sea, near the E. coast of the island of Madagascar.

DIEMEN, a town of Holland, in the province of Holland, 4 miles S. E. of Amsterdam.

DIEMEN, STRAITS OF, lie between the coast of Asia and the islands of Japan.

DIEP BAY, a bay on the N. W. coast of the island of St. Christopher.

DIEP TOWN, or **DEEP TOWN**, a town of St. Christopher, seated on the bay.

DIEPHOLT, or **DIEPHOLZ**, a county of Germany, in the circle of Westphalia.

DIEPHOLZ, the capital of the above county, situated on the Hunte, 30 miles S. S. W. of Bremen.

DIEPPE, a town of France, in the department of Lower Seine and late province of Normandy, with a good harbour, formed by the mouth of the river Arques, capable of containing 200 ships, an old castle, and two piers. It lies 30 miles N. of Rouen.

DIES, [Lat. a day,] in doomsday book, signifies one day's entertainment for the king.

DIES DATUS, in law, days of respite allowed by the court to a defendant.

DIES MARCHE was the day of congress or meeting of the English and Scots, annually appointed to be held on the marches or borders, in order to adjust all differences between them.

DIESIS, in music, is the division of a tone less than a semitone;

tone; or an interval consisting of a less or imperfect semitone. Diesis is the smallest and softest change or inflexion of the voice imaginable: it is called a faint, expressed thus (X,) by a St. Andrew's cross or saltier.

DIESPITER, in antiquity, a name given to Jupiter; and signifying diei pater, father of the day. St. Augustin derives the name from *dies*, day, and *partus*, bringing forth; Jupiter being reputed to bring forth the day.

DIESENHOFEN, a large and elegant town of the Helvetic republic, in the late canton of Schaffhausen, 5 miles S. of Schaffhausen.

DIEST, a town of France, in the department of Dyle, 15 miles N. E. of Louvain, and 22 W. of Maestricht.

DIET, [*dieta*, low Lat. *diata*.] in medicine, according to some, comprehends the whole regimen of life, with regard to air, meat, drink, sleep, watching, motion, rest, the passions, retentions, and excretions. Others restrict the term to eating and drinking alone. The natural constitution of the body of man is such, that it can easily bear some changes and irregularities without much injury. Had it been otherwise, we should be almost constantly put out of order by every slight cause. This advantage is from those wonderful communications of the inward parts, whereby, when one part is affected, another comes immediately to its relief. Thus, when the body is too full, nature causes evacuations through some of the outlets; and for this reason, diseases from absolute inanition are generally more dangerous than from repletion, unless the latter be excessive; because we can more expeditiously diminish than increase the juices of the body. Upon the same account, though temperance be beneficial to all men, the ancient physicians advised persons in good health, now and then to eat and drink more plentifully than usual. But, of the two, intemperance in drinking is safer than eating. If a man be obliged to fast, he ought to avoid all laborious work. From satiety it is not proper to pass directly to sharp hunger, nor from hunger to satiety: neither will it be safe to indulge absolute rest immediately after excessive labour, nor suddenly to fall to hard work after long idleness. In a word, all changes in the way of living should be made by degrees. The softer and milder kinds of aliment are proper for children, and for youth the stronger. Old people ought to lessen the quantity of their food, and increase that of their drink: but some allowance is to be made for custom, especially in cold climates like ours; for as in these the appetite is keener, so is the digestion better performed. Mead's "Mona et Precapta." Milk pottage for breakfast is far more wholesome than tea with bread and butter; and, if made after the following manner, is in many respects preferable to milk alone: let equal quantities of milk and water be boiled up with a little oatmeal, which will break the viscosity of the milk, and be at the same time more easily digested than the latter in an undiluted state. Besides oatmeal is a much warmer nourishment than wheaten flour, and agrees better with weak stomachs.

DIET DRINKS, in physic, include all the medicated wines, ales, and wheys, used in chronic cases. They require continuation to answer any good purpose.

DIET OF APPEARANCE, in Scots law, the day to which a defender is cited to appear in court: and every other day to which the court shall afterwards adjourn the consideration of the question.

DIET, [from *dies*, an appointed day, Skinner: from *diet*, an old German word signifying a multitude, Junius.] in matters of policy, was used for the general assembly of the states or circles of the empire of Germany, and formerly of Poland, to deliberate and concert measures proper to be taken for the good of the public. The general diet of the empire was usually held at Ratisbon: it consisted of the emperor, the ten electors, and the ecclesiastical princes; viz. the archbishops, bishops, abbots, and abbesses; the secular princes, who were dukes, marquises, counts, viscounts, or barons; and the representatives of the imperial cities. It met on the emperor's summons, and any of the princes might send their deputies thither in their stead. The diet made laws, raised taxes, determined differences between the several princes and states, and could relieve the subjects from the oppressions of their sovereigns.

DIETETICS, [*διαίτητικα*.] the science or philosophy of diets: that which teaches us to adapt particular foods to particular organs

of digestion, or to particular states of the same organs; so that the greatest possible portion of nutriment may be extracted from a given quantity of nutritive matter; or a sufficient portion may be obtained with the least possible quantity of organic action and exhaustion. In this sense the science of dietetics embraces a knowledge as well of the organs and economy of digestion, as of the substances to be digested. See **ANATOMY**, and **MEDICINE**.

DIETFURTH, a town of Germany, in the circle of Bavaria, 19 miles W. of Ratisbon.

DIETZ, or **MASSAU DIETZ**, a county of Germany, in the circle of Upper Rhine.

DIETZ, the capital of the above county, 16 miles E. of Cologne, and 25 N. of Mentz.

DIEU ET MON DROIT, [Fr. *i. e.* God and my right,] the motto of the arms of England, first assumed by Richard I. to intimate that he did not hold his empire in vassalage of any mortal. It was afterwards taken up by Edward III. and was continued without interruption to the time of king William III. who used the motto *Je maintiendrai*, though the former was still retained upon the great seal. After him queen Anne used the motto *Seniper eadem*, which had been before used by queen Elizabeth; but ever since queen Anne, *Dieu et mon droit* has been the royal motto.

DIEU ET SON ACTE, in common law, a maxim that the act of God shall hurt no man: so that if a house be beat down by a tempest, the lessee shall not only be free from an action of waste, but also have a right to take timber to rebuild the house.

DIEU, **ISLE DE**, a small island in the Atlantic, near the coast of France, 13 miles S. S. W. of Noirmoutier.

DIEUSE, or **DIEUZE**, a town of France, in the department of Meuse, 22 miles N. E. of Nanci.

DIEZ, **Str.** a town of France, in the department of Vosges, 30 miles S. E. of Luneville.

DIEZEUGMENON, [*διεζευγμενον*, Gr.] in rhetoric, a figure, whereby several clauses in a sentence relate to one verb.

DIF, the name of an instrument in music among the Arabs, serving chiefly to beat time to the voice: it is a hoop, sometimes with pieces of brass fixed to it to make a gingling, over which a piece of parchment is distended. It is beat with the fingers, and is the true tympanum of the ancients.

DIFFARREATION, in Roman antiquity, a ceremony whereby the divorce of their priests was solemnized. The word comes from the proposition *dis*, used, in composition, for division, and *farreatio*, a ceremony with wheat, of *far*, wheat.

DIFFERENCE, in heraldry, a term given to a certain figure added to coats of arms, serving to distinguish one family from another; and to shew how distant younger branches are from the elder or principal branch.

DIFFERENCE, in logic, an essential attribute belonging to some species, and not found in the genus; being the idea that defines the species. Thus, body and spirit are the two species of substance, which in their ideas include something more than is included in the idea of substance. In body, for instance, is found impenetrability and extension; in spirit, a power of thinking and reasoning: so that the difference of body is impenetrable extension, and the difference of spirit is cogitation.

DIFFERENCE, in mathematics, is the remainder, when one number or quantity is subtracted from another.

DIFFERENCE OF LONGITUDE, of two places on the earth, is an arch of the equator, comprehended between the meridians of these two places.

DIFFERENCE OF LATITUDE, of two places on the earth, is an arch of a meridian contained between the parallels of latitude of the two places.

DIFFERENTIAL, **DIFFERENTIALE**, in the higher geometry is an infinitely small quantity, or a particle of quantity so small as to be less than any assignable one. It is called a differential, or differential quantity, because frequently considered as the difference of two quantities; and, as such, is the foundation of the differential calculus: Sir Isaac Newton, and the English, call it a moment, as being considered as the momentary increase of quantity. See **FLUXIONS**.

DIFFERENTIAL METHOD is applied to the doctrine of infinitesimals, or infinitely small quantities, called the arithmetic of fluxions. It consists in descending from whole quantities to their infinitely

infinitely small differences, and comparing together these infinitely small differences, of what kind soever they be: and from thence it takes the name of the differential calculus, or analysis of infinitesimals. See CALCULUS DIFFERENTIALIS, and FLUXIONS.

DIFFUSE WRITINGS, such as are wrote in a prolix manner. Among historians, Sallust is reckoned sententious, and Livy diffuse. Thus also among the orators, Demosthenes is close and concise; Cicero, on the other hand, is diffuse.

DIFFUSION, the dispersion of the subtile effluvia of bodies into a kind of atmosphere all round them. Thus the light diffused by the rays of the sun, issues all round from that amazing body of supposed fire.

DIGAMMA, [*Διγάμμα*, Gr.] the letter F, so called because it seems to represent a double Gamma r.

DIGBY Sir KENELM, an illustrious author and statesman of the 17th century. He was descended of an ancient family in England. His great-grandfather, accompanied by six of his brothers, fought valiantly at Bosworth-field on the side of Henry VII. against the usurper Richard III. But his father, Everard, was beheaded for being engaged in the gun-powder plot against king James I. The son wiped off that stain, and was restored to his estate. King Charles I. made him gentleman of the bed-chamber, commissioner of the navy, and governor of Trinity house. He granted him letters of reprisals against the Venetians, by virtue whereof he took several prizes with a small fleet. He fought the Venetians near the port of Scanderoon, and bravely made his way through them with his booty. He was a great lover of learning, and translated several authors into English; and his "Treatise of the Nature of Bodies, and the Immortality of the Soul," discovers great penetration and extensive knowledge. He applied himself to chemistry; and found out several useful medicines, which he gave freely away to people of all sorts, especially to the poor. He indulged a whim, however, respecting a sympathetic powder for the cure of wounds at a distance; his discourse concerning which made a great noise for a while. He had conferences with Des Cartes about the nature of the soul. In the beginning of the civil wars, he exerted himself vigorously in the king's cause; but he was afterwards imprisoned, by order of the parliament, in Winchester house, and had leave to depart thence in 1643. He afterwards compounded for his estate, but was ordered to leave the nation; when he went to France, and was sent on two embassies to Pope Innocent X. from the queen, widow of Charles I. whose chancellor he then was. On the restoration of Charles II. he returned to London; where he died in 1665, aged 60.

DIGEST, **DIGESTUM**, is a collection of the Roman laws, arranged and digested under proper titles by order of the emperor Justinian. That prince gave his chancellor Tribonianus a commission for this purpose; who, in consequence thereof, chose sixteen jurisconsulti, or lawyers, to work upon the same. These, accordingly took out the best and finest decisions from the 2000 volumes of the ancient jurisconsulti, and reduced them all into one body; which was published A. D. 529, under the name of the Digest. To this the emperor gave the force of a law, by a letter at the head of the work, which serves it as a preface. The Digest makes the first part of the Roman law, and the first part of the corpus or body of the civil law, contained in 50 books. It was translated into Greek under the same emperor, and called Pandecta. See PANDECTS. Cujas says, that Digest is a common name for all books disposed in a good order and economy; and hence Tertullian calls the Gospel of St. Luke a Digest.

DIGESTER, an instrument serving to dissolve solid animal substances, in a manner similar to that performed by the stomach. This vessel was invented by Papin: after putting meat into it, together with a sufficient quantity of water, a lid is closely screwed on, so as to admit no external air. By a moderate fire, the meat will, in the course of six or eight minutes, be reduced to a perfect pulp: by augmenting the heat of the fire, or extending the time of digestion, the hardest bones may be converted into a pulp or jelly. This effect is produced by the most perfect closure of the vessel, which prevents the access or escape of air, so that the reverberations occasioned by the expansion of the aerial fluid, dissolve the whole into an uniform body, and mix the aqueous, saline, oleaginous, and other particles so strongly together, that they cannot be easily separated; but, while hot, appear one liquor, and, when cold, form a jelly, of a strength proportionate to the quantity

of flesh or bones dissolved in the water. This useful instrument has not been hitherto applied to culinary purposes; though within the last two years an imperfect imitation of it has been vended in the shops; and we state with satisfaction, that even the latter is incomparably more economical than the various kinds of stew-pans formerly employed. Cast-iron digesters are now manufactured, of various sizes and prices.

DIGESTION, in animal economy, signifies the dissolution of food taken into the stomach, in order to supply the continual loss sustained by perspiration, the different functions, or by exercise. As soon as the food is taken into the mouth, it is first broken and divided by the teeth, being at the same time moistened with a liquor supplied by the salival glands, and consequently formed into a kind of paste. Thus prepared, it passes into the stomach to ferment; a process which is effected, 1. By the salival and gastric juices, which have an effect on aliment similar to that of leaven, or yeast, on dough; 2. By the vital heat of the stomach and viscera of the abdomen; 3. By the remains of food, which adhere to the folds of the stomach, and there become acid and acrimonious; 4. By the agitation arising from the pressure of the abdomen, and the continual pulsation of the contiguous blood-vessels; 5. By the liquor which the repeated compression of those muscles causes to be discharged from the glands of the stomach: and, lastly, by air itself, which being mixed with alimentary matter, dilates by the heat of the stomach, and separates the particles of food which, from the concurrence of these causes, are converted into chyle. From the stomach, the chyle descends into the intestines, where it incorporates with the blood; which, by its volatile nature, together with the saline and nitrous parts of the air, subtilizes the aliment, and perfects its digestion.

DIGESTIVES, in medicine, such remedies as strengthen and increase the tone of the stomach, and assist in the digestion of food. To this class belong all stomachics and strengtheners, or corroborants.

DIGGING, among miners, is appropriated to the operation of freeing any kind of ore from the bed or stratum in which it lies, where every stroke of their tools turns to account: in contradistinction to the openings made in search of ore, which are called hatches, or essay hatches; and the operation itself, tracing of mines, or hatching. When a bed of ore is discovered, the beelmen free the ore from the fossils around it; and the shovelmen throw it from one shamble to another, till it reaches the mouth of the hatch.

DIGIT, [*digitus*, Lat.] in astronomy, the twelfth part of the diameter of the sun or moon, is used to express the quantity of an eclipse. Thus an eclipse is said to be of six digits, when six of these parts are hid.

DIGIT, or **MONAD**, in arithmetic, signifies any integer under 10, as 1. 2. 3. 4. 5. 6. 7. 8. 9.

DIGIT is also a measure taken from the breadth of the finger. It is properly $\frac{1}{4}$ of an inch, and contains the measure of four barley-corns laid breadth-wise.

DIGITALIS, **FOX GLOVE**: a genus of the angiospermia order, and didynamia class of plants; natural order, *Luridæ*. Calyx quinquepartite; corolla campanulated, quinquefid, ventricose; capsule ovate, bilocular. Twelve species, chiefly herbaceous; biennial, and perennial plants, which rise two or three feet high, crowned with spikes of yellow iron-coloured or purple flowers. An ointment made of the flowers of purple fox-glove and May butter, is much commended by some physicians for scrophulous ulcers which run much and are full of matter. Taken internally, this plant is a violent purgative and emetic; and is therefore only to be administered to robust constitutions.

DIGITATED, among botanists, an appellation given to compound leaves, each of which is composed of a number of simple foliola, placed regularly on a common petiole; though, strictly speaking, there must be more than four foliola to make a digitated leaf. See BOTANY.

DIGLYPH, in architecture, a kind of imperfect triglyph, console, or the like; with two channels or engravings, either circular or angular.

DIGNAN, or **DIGNANT** a town of Italy, in Istria, 3 miles from the coast.

DIGNE, a town of France, in the department of the Lower Alps, 30 miles S by W. of Embrun.

DIGNITARY,

DIGNITARY, in the canon law, a person who holds a dignity, that is, a benefice which gives him some pre-eminence over mere priests and canons. Such is a bishop, dean, arch-deacon, prebendary, &c. See **BISHOP**, **DEAN** &c.

DIGNITY, as applied to the titles of noblemen, signifies honour and authority. And dignity may be divided into superior and inferior; as the titles of duke, marquis, earl, baron, &c. are the highest names of dignity; and those of baronet, knight, serjeant at law, &c. the lowest. Nobility only can give so high a name of dignity as to supply the want of a surname in legal proceedings; and as the omission of a name of dignity may be pleaded in abatement of a writ, &c. so it may be where a peer who has more than one name of dignity, is not named by the Most Noble. No temporal dignity of any foreign nation can give a man a higher title here than that of Esquire.

DIGNITY, in the human character, the opposite of Meanness. Man is endued with a sense of the worth and excellence of his nature: he deems it more perfect than that of the other beings around him; and he perceives that the perfection of his nature consists in virtue, particularly in virtues of the highest rank. To express that sense, the term dignity is appropriated. Further, to behave with dignity, and to refrain from all mean actions, is felt to be, not a virtue only, but a duty; it is a duty every man owes to himself. By acting in that manner, he attracts love and esteem: by acting meanly, or below himself, he is disapproved and contemned.

DIGNITY, in oratory, one of the three parts of general elocution; consisting of the right use of tropes and figures. See **ORATORY**.

DIGRESSION, in oratory, is defined by Quintilian, agreeably to the etymology of the word, to be, a going off from the subject we are upon to some different thing, which, however may be of service to it. See **ORATORY**.

DIGYNIA, [from *δίς* twice, and *γυνή* a woman,] the name of an order in the first 13 classes, except the ninth, in Linnaeus's sexual method; consisting of plants, which have two female organs.

DII, the divinities of the ancient heathens, were very numerous. Every object which caused terror, inspired gratitude, or bestowed affluence, received the tribute of veneration. Man saw a superior agent in the stars, the elements, or the trees, and supposed that the waters which communicated fertility to his fields and possessions, were under the influence and direction of some invisible power inclined to favour and to benefit mankind. Thus arose a train of divinities which imagination arrayed in different forms, and armed with different powers. They were supposed to be endowed with understanding, and actuated by the same passions which daily afflict the human race; and to be appeased or provoked, like the imperfect beings whose fears gave them birth. Their wrath was to be mitigated by sacrifices and incense; and sometimes human victims bled; and thus real crimes were committed, to expiate crimes, which superstition alone supposed to exist.

DIJON, or **DIGON**, an ancient town of France, in the department of Cote d'Or, 48 miles N. E. of Autun.

DIJONNOIS, a late territory of France in the late province of Burgundy, now included in the department of Cote d'Or. Dijon was the Capital.

DIKE a ditch or drain, made for the passage of waters. The word seems formed from the verb to dig; though others derive it from the Dutch, *diik*, or dyke, a dam, sea-bank, or wall.

DIKE also signifies a work of stone, timber, earth, fascines, &c. raised to oppose the entrance of the waters of the sea, a river, lake, &c. The most stupendous works of this kind are the Dikes of Holland.

DILAPIDATION, [*dilapidatio*, Latin,] The incumbent's suffering the chancel, or any other edifices of his ecclesiastical living, to go to ruin or decay, by neglecting to repair the same; and it likewise extends to his committing, or suffering to be committed, any wilful waste in or upon the glebe-woods, or any other inheritance of the church.

DILATATION, in physics, a motion of the parts of any body, by which it is so expanded as to occupy a greater space. This expansive motion depends upon the elastic power of the body; whence it appears that dilatation is different from rarefaction, this last being produced by the means of heat.

DILATATOIRES, in anatomy, a name given to several muscles in the human body.

DILATORY PLEAS, in law, are such as are put in merely for delay; and there may be a demurrer to a dilatory plea, or the defendant shall be ordered to plead better, &c. The truth of dilatory pleas is to be made out by affidavit of the fact, by stat. 4. and 5. Ann. See **PLEA**.

DILATRIS, a genus of the monogynia order, and triandria class of plants. No calyx; corolla six-petaled, shaggy; stigma simple. Three species natives of the Cape.

DILEMMA [*δῆλον*, Gr.] an argument equally conclusive by contrary suppositions. A young rhetorician applied to an old sophist to be taught the art of pleading, and bargained for a certain reward to be paid, when he should gain a cause. The master sued for his reward, and the scholar endeavoured to elude his claim by a dilemma: If I gain my cause, I shall withhold your pay, because the judge's award will be against you; if I lose it, I may withhold it, because I shall not yet have gained a cause. On the contrary, says the master, if you gain your cause, you must pay me, because you are to pay me when you gain a cause; if you lose it, you must pay me, because the judges will award it.

DILIGENCE, in Scots law, signifies, 1. that care and attention which parties are bound to give, in implementing certain contracts or trusts, and which varies according to the nature of the contract. 2. Certain forms of law, whereby the creditor endeavours to operate his payment, either by affecting the person or estate of the debtor.

DILL, in botany. See **ANETHUM**.

DILLA, or **MOUNT DILLA**, a remarkable promontory of Hindostan, on the coast of Malabar, 20 miles N. by W. of Tellichery.

DILLEMBURG, or **DILLENBURGH**, a country of Germany, in Weteravia.

DILLENBURGH, the capital of the county, 14 miles N. W. of Wetzlar.

DILLENGEN, a town of Germany, in the circle of Suabia, 18 miles N. E. of Ulm.

DILLENIA, a genus of the polygynia order and polyandria class of plants. Calyx pentaphyllous; petals five; capsule, polyspermous, coalited, full of pulp. There are seven species, very handsome trees natives of the East Indies.

DILOGY, [*διλογία*, Gr.] a rhetorical figure, when a doubtful word signifies two things.

DILUENT, that which has the power to thin and attenuate other matter.

DILUTE, to dilute a body is to render it liquid; or, if it were liquid before, to render it more so, by the addition of a thinner thereto. These things thus added, are called diluents, or dilutors.

DIMACHÆ, [from *δίς*, double, and *μαχη*, fight,] in antiquity, a kind of horsemen, first instituted by Alexander. Their armour was lighter than that of the infantry, and at the same time heavier than that used by horsemen, so that they could act as horse or foot as occasion required.

DIMENSION, in geometry, is either length, breadth, or thickness; hence, a line hath one dimension, viz. length; a superficies two, viz. length and breadth; and a body, or solid, has three, viz. length, breadth, and thickness.

DIMENSION is used with regard to the power of the roots of an equation, which are called the dimensions of that root. Thus in a simple equation $x = a + b$, the unknown quantity is only of one dimension: in a quadratic equation $x^2 = a^2 + b^2$, it is of two dimensions: in a cubic $x^3 = a^3 + b^3$ it is of three dimensions; and so on. See **ALGEBRA**.

DIMETÆ, the name given by the Romans to the ancient Britons, who inhabited the territories now called Caernarthenshire, Pembrokeshire, and Cardiganshire.

DIMINUTION, in architecture, a contraction of the upper part of a column, by which its diameter is made less than that of the lower part. See **ARCHITECTURE**.

DIMINUTION, in law, is where the plaintiff or defendant in a writ of error, alleges on an appeal to a superior court, that part of the record is omitted, and remains in the inferior court not certified; whereon he prays that it may be certified by certiorari. Co. Ent. 222, 242.

DIMINUTION, in music, is when there are several words which

are to make tones, and several quick motions in a cadence, several quavers, semiquavers, &c. corresponding to a crochet or minim, as when a semibreve is divided into two minims, four crotchets, &c.

DIMINUTION, in rhetoric, the exaggerating of what you have to say by an expression that seems to diminish it.

DIMINUTIVE, in grammar, a word formed from some other, to soften or diminish the force of it, or to signify a thing is little in its kind. Thus *cellule* is a diminutive of *cell*, *globule* of *globe*, *hillock* of *hill*.

DIMISSORY LETTERS, *LITERÆ DIMISSORIÆ*, in the canon law, a letter given by a bishop to a candidate for holy orders, having a title in his diocese, directed to some other bishop, and giving leave for the bearer to be ordained by him.

DIMERITE, [from *dim* and *erite*, to divide,] a name given to the Apollinarians, who at first held, that Christ only assumed a human body, without taking a reasonable soul; but being at length convinced by texts of scripture, they allowed, that he did assume a soul, but without understanding; the Word supplying that faculty. From this way of separating the understanding from the soul, they were denominated *Dimerites*, or *Separaters*.

DIMORCARPUS, in botany, a genus of the octandria monogynia class and order. Calyx five-cleft; corolla five-petaled; berries two, one-seeded, large. One species, found in China.

DIMORPHA, in botany, a genus of the diadelphia decandria class and order. Petals one large convolute, in place of the keel; standard and wings none. Three species, natives of the woods of Guiana.

DIMOTUC, a town of European Turkey, in Romania, 12 miles S. W. of Adrianople.

DINABURG, a town of Russia, in the government of Polotsk, on the Dwina; 80 miles N. W. of Polotsk.

DINAGEPOUR, a town of Hindostan, in the country of Bengal, 85 miles N. of Moorsbedabad.

DINAN, or **DINANT**, a strong town of France, in the department of the North Coast, 20 miles S. of St. Malo.

DINANT, a town of Germany, in Westphalia, five miles N. of Charlemont.

DINARCHY, [*Δυναρχία*, Gr.] a government by two. Such was the kingdom of Laconia, which had two royal families for several centuries, both descended from Hercules, each of which afforded a king to the state, both reigning at one time; a mode of government not paralleled in the history of any other country in the world.

DINASMAWDDWY, **DINASMONDY**, or **DINAMOUTHY**, a town of N. Wales, in Merionethshire, 18 miles S. of Bala. Lon. 3. 40. W. Lat. 52. 37. N.

DINKELSPIL, a town of Germany, in Suabia, 37 miles S. W. of Nuremberg.

DINDIGUL, a city of India, in the Mysore country, 51 miles S. W. of Trichinopoly.

DINGLE, a sea-port of Ireland, in Kerry, Munster, 21 miles W. S. W. of Tralee.

DINGWALL, an ancient and flourishing royal borough of Scotland, in the county of Ross, 18 miles W. of Cromarty.

DINKELBUHL, or **DUNKELSPUHL**, an imperial town of Germany, in Suabia, 16 miles S. W. of Aispach.

DINOCRATES, a celebrated architect of Macedonia, who rebuilt the temple of Ephesus, when burnt by Erostratus, with much more magnificence than before. Vitruvius informs us, that Dinocrates proposed to Alexander the Great, to convert mount Athos into the figure of a man, whose left hand should contain a walled city, and all the rivers of the mount flow into his right hand, and from thence into the sea! He also conceived a scheme for building the dome of the temple of Arsinoe at Alexandria, of loadstone; that should by its attraction uphold her iron image in the centre, suspended in the air! Projects which at least shewed a vast extent of imagination.

DIOCESE, [*diocesis*, and *diocesis*,] the circuit of every bishop's jurisdiction; for this realm has two divisions, one into shires or counties, in respect of temporal policy; another into dioceses, in respect of jurisdiction ecclesiastical.

DIOCESE is also used in ancient authors, for the province of a metropolitan. Diocesis was originally a civil government, composed of divers provinces. The first division of the empire into

dioceses is ordinarily ascribed to Constantine; who distributed the whole Roman state into four: viz. those of Italy, Illyria, the East, and Africa. And yet, long before Constantine, Strabo, who wrote under Tiberius, takes notice, (lib. xiii. p. 432,) that the Romans had divided Asia into dioceses; and complains of the confusion such a division occasioned in geography, Asia being no longer divided by people, but by dioceses, each whereof had a tribunal, or court, where justice was administered.

DIOCLEIA, [*Διοκλεία*,] in antiquity, a solemnity kept in the spring at Megara, in memory of the Athenian hero, who died in the defence of the youth he loved.

DIOCLESIANUS, **CAIUS VALERIUS JOVIUS**, a celebrated Roman emperor born of an obscure family in Dalmatia, in A.D. 245. He was first a common soldier, and by merit and success he gradually rose to the office of a general; and at the death of Numerian, in 284, he was invested with imperial power. In this high station he rewarded the fidelity of Maximian, who had shared with him all the subordinate offices in the army, by making him his colleague on the throne. He created two subordinate emperors Constantius and Galerius, by the title of Caesars, whilst he claimed for himself and his colleague the superior title of Augustus. Dioclesian has been celebrated for his military virtues; and though he was not polished by education, yet he was a patron of learning. He was bold, resolute, and active, and well acquainted with the arts, which made him respectable even in the eyes of his enemies. But his cruelty to the Christians has been deservedly branded with infamy. After he had reigned 22 years in the greatest prosperity, he publicly abdicated the crown at Nicomedia in 305, and retired to a private station at Salona. Maximian his colleague followed his example, but not from choice; and when he some time after endeavoured to rouse the ambition of Dioclesian, and persuade him to re-assume the imperial purple, he received for answer, that Dioclesian took now more delight in cultivating his little garden, than he formerly enjoyed in a palace, when his power was extended over all the earth. He lived nine years after his abdication in the greatest security and enjoyment at Salona, and died in 314, in the 68th year of his age. Dioclesian is the first on record, except Lysurgus and Sylla, who voluntarily resigned his power. His bloody persecution of the Christians forms a chronological era, called the era of Dioclesian, or of the Martyrs. It was long used in theological writings, and is still followed by the Copts and Abyssinians. It commenced August 29, A.D. 284.

DIOCESIS, [*Διοκίσις*, Gr.] See **DIOCESE**.

DIODIA, a genus of the monogynia order, and tetrandria class of plants; natural order, Stellata. Corolla monopetalous, funnel-shaped; capsule two-celled, two-seeded. Six species, chiefly natives of the West-Indies.

DIODON, a genus of fishes of the order cartilaginei. Jaws bony and undivided; aperture of the gills linear; body covered on all sides with long moveable spines; no ventral fins. There are three species.

D. HYSTRIX, or the **SEA PORCUPINE**, grows to nearly two feet in length, and inhabits the Indian and American seas. In some of the West India islands it is used for food, but, in general, is little valued. Its resemblance to the porcupine and hedge-hog, and likewise to the sea-urchins, is considerable, both in appearance and manners. It possesses the faculty of raising and depressing its spines at pleasure, and likewise of flattening its body, or extending it to a globular form, and is often fished for with a rod and line, merely for the sake of the curious spectacle it exhibits by these violent alternations. See **PLATE LV**.

D. OBLONGUS, the **OBLONG SUN-FISH**, grows to a great bulk; one examined by Sylvianus was above 100 pounds in weight; and Dr. Borlase mentions another taken at Plymouth in 1734, that weighed 500. In form it resembles a bream or some deep fish cut off in the middle. The mouth is very small, and contains in each jaw two broad teeth, with sharp edges. The eyes are little; before each is a small semilunar aperture; the pectoral fins are very small, and placed behind them. The colour of the back is dusky, and dappled; the belly silvery: between the eyes and the pectoral fins, are certain streaks pointing downwards. The skin is free from scales. When boiled, it has been observed to turn into a glutinous jelly, resembling boiled starch when cold, and served the purposes of glue on being tried on paper and leather. The meat

meat of this fish is uncommonly rank: it feeds on shell-fish. The sun-fish of the Irish. (See *SQUALUS*;) differs, in all respects from this.

DIODORUS, surnamed **SICULUS**, or **SICILIAN**, an ancient historian, born at Argyn in Sicily. He wrote a history of Egypt, Persia, Syria, Media, Greece, Rome, and Carthage; and it is said that he visited all the places which he has mentioned in his history. It was the labour of 30 years. He is, however, too credulous in some of his narrations; and often wanders far from the truth. He often dwells too long upon fabulous reports, and trifling incidents; while events of the greatest importance to history are treated with brevity, and sometimes passed over in silence. He lived in the age of Cæsar and Augustus; and spent much time at Rome to procure information, and authenticate his history. This important work, which he composed in Greek, contained 40 books, of which there are only 15 remaining. The style is clear, and very suitable to history. The best edition is that of Amsterdam, 1743, in 2 vols. folio.

DIOECIA, [*i. e.* two houses, from *dis*, twice, and *oia*, a house,] the 22d class in Linnæus's sexual system, consisting of plants, which have no hermaphrodite flowers, but produce male and female flowers on separate roots. These last only ripen the seeds; but require for that purpose the vicinity of a male plant; for the aspersion or sprinkling of the male dust. From the seeds of the female flowers thus impregnated, are raised, both male and female plants. See **BOTANY**.

DIODENES of Apollonia, in the island of Crete, held a considerable rank among the philosophers who taught in Ionia before Socrates appeared at Athens. He was the scholar and successor of Anaximenes, and in some measure rectified his master's opinion concerning air being the cause of all things. It is said, that he was the first who observed that air was capable of condensation and rarefaction. He passed for an excellent philosopher, and died about A. C. 450.

DIODENES, the **CYNIC**, a famous ancient philosopher, the son of a banker of Sinope. Being banished with his father for coining false money, he retired to Athens, where he studied philosophy under Antisthenes. He added new degrees of austerity to the sect of the Cynics, and never did any philosopher carry so far a contempt for the conveniences of life. He was one of those extraordinary men who run every thing to extremity, without excepting even reason itself; and who confirm the saying, that "there is no great genius without a tincture of madness." He lodged in a tub; and had no other moveables besides his staff, wallet, and wooden bowl, which last he threw away, on seeing a boy drink out of the hollow of his hand. He used to call himself a vagabond, who had neither house nor country; was obliged to beg, was ill clothed, and lived from hand to mouth: and yet, says Ælian, he took as much pride in these things, as Alexander could in the conquest of the world. He was not indeed a jot more humble, than those who are clothed in rich apparel, and fare sumptuously every day. He looked down on all the world with scorn; he magisterially censured all mankind, and thought himself unquestionably superior to all other philosophers. Alexander one day paid him a visit, and made him an offer of riches or any thing else: but all that the philosopher requested of him was, to stand from betwixt the sun and him; as if he had said, "Do not deprive me of the benefits of nature, and I leave to you those of fortune." The conqueror was so affected with the vigour and elevation of his soul, as to declare, that "if he was not Alexander, he would choose to be Diogenes." Diogenes had great presence of mind, as appears from his smart sayings and quick repartees; and Plato seems to have hit off his true character, when he called him a Socrates run mad. He spent a great part of his life at Corinth. As he was going over to the island of Ægina, he was taken by pirates, who carried him into Crete, and there exposed him to sale. He answered the crier, who asked him what he could do, that "he knew how to command men;" and perceiving Xenias, a Corinthian, going by, he said, "sell me to that gentleman, for he wants a master." Xenias struck with the singularity of Diogenes bought him, and carrying him to Corinth, appointed him tutor to his children, and soon entrusted him with the management of his house. Diogenes's friends being desirous of redeeming him, "You are fools (said he); the lions are not the slaves of those who feed them, but they are the servants of the lions." He therefore plainly told Xenias, that he ought to obey him, as

people obey their governors and physicians. He died at Corinth, when he was about 90 years old: but authors are not agreed either as to the time or manner of his death.

DIODENES, surnamed **LAERTIUS**, from Laerta in Cilicia, his birth-place, an ancient Greek author, who wrote ten books of the Lives of the Philosophers, still extant. In what age he flourished, is not determined. The oldest writers who mention him are Soter of Alexandria, who lived in the time of Constantine the Great, and Hesychius Milesius, who lived under Justinian. Diogenes often mentions Plutarch and Phavorinus, with approbation; and therefore, as Plutarch lived under Trajan, and Phavorinus under Adrian, it is certain that he could not flourish before the reigns of those emperors. Menage has fixed him to the time of Severus; that is, about A. D. 200. From certain expressions in his writings, some have fancied him to have been a Christian; but, as Menage observes, the immoderate praises he bestows upon Epicurus, incline us rather to suppose that he was an Epicurean. He divided his Lives into books, and inscribed them to a learned lady of the Platonic school, as he himself intimates in his life of Plato. Montaigne was so fond of this author, that instead of one Laertius, he wishes he had a dozen; and Vossius says, that his work is as precious as gold. Without doubt we are greatly obliged to him for what he has recorded of the ancient philosophers; but if he had been as exact in the writing, as he was judicious in the choice of his subject, we had been still more obliged to him. Bishop Burnet, in the preface to his Life of Sir Matthew Hale, speaks of him in the following proper manner: "There is no book the ancients have left us (says he), which might have informed us more than Diogenes Laertius's Lives of the Philosophers, if he had had the art of writing equal to that great subject which he undertook: for if he had given the world such an account of them as Gassendus has done of Pieresc, how great a stock of knowledge might we have had, which by his unskilfulness is in a great measure lost! since we must now depend only on him, because we have no other, and better author, who has written on that argument." There have been several editions of his Lives of the Philosophers; but the best is that printed in two volumes 4to, at Amsterdam, 1693. This contains the advantages of all the former, besides some peculiar to itself: the Greek text, and the Latin version, corrected and amended by Meibomius; the entire notes of Henry Stephens, both the Casaubons, and of Menage; 24 copper-plates, elegantly engraved: to which is added, The History of the Female Philosophers, written by Menage, and dedicated to Madam Dacier. Diogenes wrote also a book of Epigrams upon illustrious men, called Pammetrus, from its various kinds of metre: but this is lost.

DIOMEDES, in fabulous history, a tyrant of Thrace, who is said to have fed his horses with the flesh of men. Hercules killed him, and threw him to be eaten by his own carnivorous horses; Hyginus says there were four of them, and that the hero afterwards killed them, along with Abderus, their groom.

DIOMEDES, king of Ætolia, the son of Tydeus and Deiphyle, one of the bravest of the Grecian chiefs in the Trojan war. He often engaged Hector and Æneas, and obtained much military glory. He went with Ulysses to steal the Palladium from the temple of Minerva, in Troy; and assisted in murdering Rhesus, king of Thrace, and carrying off his horses. At his return from the siege of Troy, he lost his way in the darkness of the night, and landed in Attica, where his companions plundered the country, and lost the Trojan Palladium. During his long absence, his wife Ægiale had prostituted herself to Cometes, one of her servants. This was attributed to the resentment of Venus, whom Diomedes had wounded in a battle before Troy. He resolved to abandon his native country, which was the seat of his disgrace; and the attempts of his wife to take away his life, hastened his departure. He came to that part of Italy which has been called Magna Græcia, where he built a city, which he called Argyrippa, and married the daughter of Daunus the king of the country. He died there in extreme old age; or, according to a certain tradition, he perished by the hand of his father-in-law.

DIOMEDIA, in ornithology, a genus of the order anseres. Bill straight; superior mandible, crooked at the point; lower one truncated; nostrils oval, open, a little prominent, placed on the sides. There are four species.

D. DEMERSA, has no quill-feathers on the wings; and the feet have four toes, connected together by a membrane. It is the black

black penguin of Edwards, about the size of a goose, and is found at the Cape of Good Hope. It is an excellent swimmer and diver; but hops and flutters in a strange aukward manner on the land, and, if hurried, stumbles perpetually, and frequently runs for some distance like a quadruped, making use of its wings instead of legs, till it can recover its upright posture; crying out at the same time like a goose, but in a much hoarser voice.

D. EXULANS, has pennated wings, and three toes on each foot. It is the albatrosse of Edwards; and is about the size of a pelican. These birds are found in the ocean betwixt the tropics, and at the Cape of Good Hope. They are also often seen in vast flocks in Kamtschatka, and the adjacent islands, about the end of June, where they are called great gulls; but it is chiefly in the bay of Penschinensi, the whole inner sea of Kamtschatka, the Kurile isles, and that of Bering; for on the eastern coasts of the first they are scarce, a simple straggler only appearing now and then. Their chief motive for frequenting these places, seems to be plenty of food; and their arrival is a sure presage of shoals of fish following. At their first coming they are very lean, but soon grow immensely fat. See Plate LVIII.

DIONEÆ, in botany, a genus of the decandria-monogynia class and order. Natural order, Grinales. Calyx five-leaved; petals five; capsule one-celled, gibbous, containing many seeds. One species, viz. *D. mucipula*, Venus's fly-trap, a native of North Carolina, in swampy places. This is a newly discovered sensitive plant, in the construction of which, nature seems to have had some view towards its nourishment, in forming the upper joint of its leaf like a machine to catch food; and placing upon the middle of it the bait for the unhappy insect that becomes its prey. Many minute red glands that cover its inner surface, and which, perhaps, discharge some sweet liquor, tempt the poor insect to taste them; and the instant these tender parts are irritated by its feet, the two lobes rise up, grasp it fast, lock the two rows of spines together, and squeeze it to death. See Plate XXXV.

DIOPHANTINE PROBLEMS, in mathematics, certain questions relating to square and cube numbers, and right-angled triangles, &c. the nature of which was determined by Diophantus. In these questions it is endeavoured to find commensurable numbers to answer indeterminate problems, which bring out an infinite number of incommensurable quantities. See ALGEBRA.

DIOPHANTUS, a mathematician of Alexandria, who is believed to have lived about the third century. We have his works, which were published with notes at Paris, in 1621, by Bachet de Meziriac; and another edition in 1670, with observations on every question, by M. Fermat.

DIOPTRA, an instrument invented by Hipparchus, for leveling water-courses; taking the height of towers, and determining the distances of planets, &c.

DIOPSIS, a genus of the class vermes and order diptera. Head with two inarticulate filiform horns much longer than the head, at the tip of which are placed the eyes. It inhabits South America and Guinea, and resembles the ichneumon. There is but one species. See Plate XXXVII.

DIOPTRICS, the science of refractive vision; or that part of optics which considers the different refractions of light in its passing through different mediums, as air, water, glass, &c. and especially lenses. See OPTICS.

DIOSCOREA, in botany, a genus of the hexandria order, and diœcia class of plants; natural order samentaceæ. Male calyx sexpartite, no corolla; female sexpartite; no corolla; three styles; capsule trilocular, compressed; seeds two, membranaceous. There are fifteen species, of which the only remarkable one is the sativa or yam. This has slender stalks, which trail upon the ground and extend a great way; these frequently put out roots from their joints as they lie upon the ground, by which the plants are multiplied. The roots are eaten by the inhabitants of both the Indies; and are particularly serviceable in the West India islands, where they make the greatest part of the negro's food. The plant is supposed to have been brought from the East to the West Indies; for it has never been observed to grow wild in any part of America; but in the island of Ceylon, and the coast of Malabar, it grows in the woods, and there are in those places a great variety of sorts. It is propagated by cutting the root in pieces, observing to preserve an eye in each, as is practised in planting potatoes. One plant will produce three or four large roots. The inside is white, and of the consistence of red beet. It resembles the potatoe in its

mealiness, but is of a closer texture. When raw, the yams are viscous and clammy: when roasted or boiled, they afford very nourishing food; and are often preferred to bread by the inhabitants of the West Indies, on account of their lightness and facility of digestion.

DIOSMA, **AFRICAN SPIRÆA**, a genus of the monogynia order, and pentandria class of plants. Corolla pentapetalous, nectarium crown-shaped above the germen: capsules five, coalited. There are nineteen species.

DIOSPYROS, the **INDIAN DATE PLUM**, a genus of the diœcia order, and polygamia class of plants, natural order Bicornes. Calyx hermaphrodite, quadrifid; corolla urceolated, quadrifid; styles quadrifid; berry octospermous: male calyx, corolla, and stamina, as in the former. There are nine species.

D. LOTUS, is supposed to be a native of Africa, from whence it was transplanted into several parts of Italy, and also into the south of France. The fruit of this tree is supposed to be the lotus with which Ulysses and his companions were said to have been enchanted, and which made those who eat it forget their country and relations. In the warmer parts of Europe this tree grows to the height of thirty feet.

D. VIRGINIENSIS. See Plate XXXV.

DIPHYSA, a genus of the class and order diadelphica decandria. Calyx half five-cleft; legume with a bladder on each side; seeds hooked. There is one species, a small tree of New Spain.

DIPHTHONG, [*διφθωγγ*], a coalition of two vowels to form one sound. Diphthongs are divided into proper and improper.

DIPHTHONGS, IMPROPER, are those wherein only one of the vowels is sounded, the other being sunk; as *æ*, and *œ*, in the Latin, and *ea*, *ei*, *eo*, *ie*, *oa*, *ae*, *ue*, and *ui*, in the English language. The Latins pronounced the two vowels in their diphthongs *æ* or *œ*, *œ* or *æ*, much as we do; only that the one was heard much weaker than the other, though the division was made with all the delicacy imaginable.

DIPHTHONGS, PROPER, are such as include the original sound of both the component vowels, though still in one syllable; such as *au*, *eu*, and *ei*, in Latin; and *ai*, *au*, *ay*, *eu*, *ey*, *oi*, and *ou*, in English.

DIPLOE, the soft medullium, or medullary substance, which lies between the two laminae of the bones of the cranium.

DIPLOMA, [*διπλωμα*], a letter or writing conferring some privilege, so called, because they used formerly to be written on waxed tables, and folded together.

DIPLOMA is peculiarly used for an instrument or licence given by colleges, societies, &c. to clergymen or physicians, to exercise their respective professions, after passing examinations, and being admitted to a degree.

DIPLOMATICS, the science of diplomas, or of ancient literary monuments, public documents, &c. It does not, however, nor can it, absolutely extend its researches to antiquity; but is chiefly confined to the middle age, and the first century of modern times. For though the ancients were accustomed to reduce their contracts and treaties into writing; yet they grav'd them on tables, or covered them over with wax, or brass, copper, stone, or wood, &c. And all that in the first ages were not traced on brass or marble, has perished by the length of time, and the destructive events, that have taken place. The word diploma signifies, properly, a letter or epistle, folded in the middle, and not open. But, in more modern times, the title has been given to all ancient epistles, letters, literary monuments, and public documents, and to all those pieces of writing which the ancients called Syngrapha, Chirographa, Codicilli, &c. In the middle age, and in the diplomas themselves, these writings are called Litteræ, Præcepta, Placita, Chartæ indiculæ, Sagilla, and Bullæ; as also Panchartæ, Pantochartæ, Tractoriæ, Descriptiones, &c. The originals of these pieces are named Exemplaria, or Autographa, Chartæ authenticæ, Originalia, &c. and the copies, Apographa, Copiæ, Particulæ, &c. The collections that have been made of them, are called Chartaria, and Chartulia. The place where these papers and documents were kept, the ancients named Scrinia, Tabularium, or Ararium, words that were derived from the tables of brass, and, according to the Greek idiom, Archeum or Archivum. To understand the nature of these ancient papers, diplomas, and MSS. and to distinguish the authentic from the counterfeit, it is necessary to know that the paper of the ancients came from Egypt, and was formed of thin leaves or membranes, taken from the

the branches of a tree named *Papyrus*, or *Bibulum Ægyptiacum*, and which were pasted one over the other with the slime of the Nile, and were pressed and polished with a pumice-stone. This paper was very scarce; and it was of various qualities, forms, and prices, which they distinguished by the names of *charta hieratica*, *liria*, *augusta*, *amphitheatrica*, *satrica*, *tantrica*, *emporetica*, &c. They cut this paper into square leaves, which they pasted one to the other, in order to make rolls of them: from whence an entire book was called *volumen*, from *volendo*: and the leaves of which it consisted, *pagina*. Sometimes, also, they pasted the leaves all together by one of the extremities, as is now practised in binding: by this method they formed the back of a book, and these the learned call *codices*. They rolled the volume round a stick, which they named *umbilicus*: and the two ends that came out beyond the paper, *cornua*. The title, wrote on parchment, in purple characters, was joined to the last sheet, and served it as a cover. They made use of all sorts of strings or ribbands, and even sometimes of locks, to close the book; and sometimes also it was put into a case. But there is not now to be found, in any library or cabinet whatever, any one of these volumes. We have been assured, however by a traveller, that he had seen several of them in the ruins of *Herculaneum*; but so much damaged, the paper so stiff and brittle, by the length of time, that it was impossible to unroll them, and consequently to make any use of them; for on the first touch they fell into shatters. We know not the precise time when our modern paper was invented: and when they began to make use of pens in writing, instead of the stalks of reeds. The ink that the ancients used was not made of vitriol and galls, like the modern, but of soot. Sometimes also they wrote with red ink made of vermilion; or in letters of gold, on purple or violet parchment. It is easy for those who apply themselves to this study, to distinguish the parchment of the ancients from that of the moderns, as well as their ink and various exterior characters; but that which best distinguishes the original from the counterfeit is, the writing or character itself; which is so distinctly different from one century to another, that we may tell with certainty within about forty or fifty years, when any diploma was written. There are two works which furnish the clearest lights on this matter, and which may serve as sure guides in judging of what are called ancient diplomas. The one is the celebrated treatise on the *Diplomatic*, by F. Mabillon; and the other, the first volume of the *Chronicon Gotvicense*. We there find specimens of all the characters, the flourishes, and different methods of writing, of every age. For these matters, therefore, we must refer our readers to those works; and shall here only add, that all the diplomas are wrote in Latin, and consequently the letters and characters have a resemblance to each other: but there are certain strokes of the pen which distinguish not only the ages, but also the different nations; as the writings of the Lombards, French, Saxon, &c. The letters in the diplomas are also usually longer, and not so strong as those of MSS. There has also been introduced a kind of court hand, of a very disproportionate length, and the letters of which are called *Exiles litterariæ*, *crispæ*, *ac protractiores*. The first line of the diploma, the signature of the sovereign, that of the chancellor, notary, &c. are usually wrote in this character. The signature of a diploma consists either of the sign of the cross, or of a monogram or cipher, composed of the letter of the names of those who subscribed it. The initial letters of the name, and sometimes also the titles, were placed about this cross. By degrees the custom changed, and they invented other marks. They exhibited, added also the date and epoch of the signature, the feasts of the church, the days of the kalendar, &c. The successive corruption of the Latin language, the style and orthography of each age, as well as their different titles and forms; abbreviations, accentuation, and punctuation, and the various methods of writing the diphthongs; all these matters united, form so many characters and marks by which the authenticity of a diploma is to be known. The seal annexed to a diploma was anciently of white wax, and artfully imprinted on the parchment itself. It was afterward pendent from the paper, and inclosed in a box or place, which they called *bullæ*. There are some also that are stamped on metal, and even on pure gold. When a diploma bears all the characters that are requisite to the time and place where it is supposed to be written, its authenticity is not to be doubted: but, at the same time, we cannot examine them too scrupulously, seeing that the monks and priests of former ages have been very adroit in making counterfeits; and the more

so, as they enjoyed the confidence of princes and statesmen, and were even sometimes in possession of their rings or seals. As to MSS. that were wrote before the invention of printing, see *MANUSCRIPT*.

DIPPING, among miners, signifies the interruption or breaking off the veins of ore; an accident that gives them a great deal of trouble before they can discover the ore again. A great deal of the skill of the miners consists in the understanding of this dipping of the veins, and knowledge how to manage it. In Cornwall they have this general rule to guide them in this respect; most of their tin loads, which run from E. to W. constantly dip towards the north. Sometimes they underlie, that is, they slope down towards the N. three feet in height perpendicular.

DIPPING NEEDLE, or **INCLINATORY NEEDLE**, a magnetical needle, so hung, as that, instead of playing horizontally, and pointing out N. and S. one end dips, or inclines to the horizon, and the other points to a certain degree of elevation above it. It is used for observing the quantity of inclination towards the earth, assumed by the magnetic needle. The general method of constructing dipping needles is, to pass an axis quite through the needle itself, and to let the extremities of the axis rest upon two supports, like the beam of a pair of scales, that the needle may move vertically round; and hence, when placed in the magnetic meridian, it will naturally assume that position which is called the magnetic line, viz. the two ends nearly north and south, and one of them inclined considerably to the horizon. The degrees of this inclination are shewn upon a graduated circle; and when the instrument is made use of at land, it has a stand, but at sea a ring is necessary to suspend it. When furnished with a stand, it has also a spirit-level; and the stand has three screws, by which the whole is adjusted in such a manner as to let the centre of motion in the needle, and the mark of 90° on the lower part of the divided circle, be exactly in the same line perpendicular to the horizon. The greatest imperfections attending this instrument are the balancing of the needle itself, and the difficulty of knowing whether, after being made magnetic, it be properly balanced or not. The inaccuracy here indeed can be but very small, as arising only from dust or moisture. The method recommended by Mr. Cavallo, to obviate these inconveniences, is first to observe the dip of the needle; then to preserve its magnetism by the application of magnets, so that the end of it which before was elevated above the horizon, may now be below it; and, lastly, to observe its dip again; for a mean of the two observations will be pretty near the truth, though the needle may not be perfectly balanced. See *MAGNETISM*, and *MAGNETICAL NEEDLE*.

DIPSACUS, **TEAZEL**, a genus of the monogynia order, and tetrandia class of plants; natural order, *Aggregata*. Common calyx polyphyllous, proper above; receptacle paleaceous. There are four species; the most remarkable is the

D. CARDUS FULLONUM, which grows wild in many parts of England. It is of singular use in raising the knap upon woollen cloth. For this purpose, the heads are fixed round the circumference of a large broad wheel, which is made to turn round, and the cloth is held against them. In the west of England, great quantities of the plant are cultivated for this use. It is propagated by sowing the seeds in March, upon a well prepared soil. About one peck of seed is sufficient for an acre, as the plants must have room to grow; otherwise the heads will not be large enough, nor in great quantity.

DIPTERA, [from *δίς*, and *πτερον*, wing,] in entomology, an order of insects, which have only two wings, and under each wing a style or oblong body, terminated by a protuberance, and called a balancer.

DIPTYCH, or **DIPTYCHA**, in antiquity, was a public register, wherein were written the names of the consuls, and other magistrates, among the heathens; and of bishops, and living as well as dead brethren, among the Christians. The word is Greek, *διπτυχα*, the plural of *διπτυχον*, q. d. a book folded in two leaves; though there were some in three, and others in four, or five leaves.

DIPTERYX, in botany, a genus of the diadelphia decandria class and order; natural order, *Papilionaceæ*, or *Leguminosæ*. Calyx two, upper segments winged; legume ovate, compressed, one-seeded. There are two species, viz. *D. odorata*, *Coumarouna*, and *D. oppositifolia*, *Taralea*, both tall trees; about sixty feet high; very much branched at top; the leaves are large, alternate, and pinnate, natives of South America.

DIPUS,

DIPUS, the **JERBOA**, a genus of the class mammalia, order glires. Two front teeth in the upper, and in the under jaw; fore legs very short, hind legs very long; clavicles in the skeleton; tail long, and tufted at the tip. There are six species.

D. SAGITTA, or the Egyptian jerboa of Pennant, is about the size of a rat, and was known to the ancients by the name of the two-footed mouse. It is to be met with in various parts of Africa, and in the eastern provinces of Siberia. In its posture and movement it greatly resembles a bird. It stands on its hind feet, and rarely places its fore feet to the ground, employing them almost exclusively in applying food to its mouth, in the same manner as the kangaroo. See Plate LXVI.

D. TAMARICINUS, the **MARSH JERBOA**, or **TAMARISK MOUSE**, of Dr. Pallas, has five toes behind, and three before, with the rudiments of a fourth; the tail is obscurely annulated. The body and head measure about $5\frac{1}{2}$ inches in length; the tail is about the same length. This species inhabits the salt marshes near the Caspian sea; and is supposed to feed on the fruit of the tamarix and nitrium, which grow in these marshes. Under the roots of these trees it forms very deep burrows, which have two entrances. It is a very elegant little animal. See Plate LXVI.

DIRÆ, the general name of the three Furies in the Pagan mythology. They were so called, as being quasi Deorum ira, the ministers of divine vengeance in punishing guilty souls after death. They were the daughters of Acheron and Night. See **FURIES**.

DIRCA, a genus of the monogynia order, and octandria class of plants; natural order, Vepreculæ. No calyx; corolla tubular, with the limb indistinct; stamina longer than the tube; berry monospermous. There is one species, a small shrub of North America.

DIRECT, in astronomy. A planet is said to be direct when it appears to an observer on the earth to go forward in the zodiac, or according to the succession of the signs. See **ASTRONOMY**.

DIRECT, in matters of genealogy, is understood of the principal line, or the line of ascendants and descendants, in contradistinction to the collateral line. The heirs in the direct lines always precede those in the collateral lines.

DIRECT RAY, in optics, is a ray flowing from a point of a visible object directly to the eye, through one and the same medium.

DIRECT EAST and WEST DIALS, dials drawn upon planes that directly face the east and west points of the horizon, or are parallel to the meridian. See **DIALING**.

DIRECT SOUTH and NORTH DIALS, are those which face directly the north and south points of the horizon, or parallel to the prime vertical circle. See **DIALING**.

DIRECTION, in mechanics, signifies the line or path of a body's motion, along which it endeavours to proceed according to the force impressed upon it. See **MECHANICS**.

DIRECTION, ISLANDS OF, four small islands at the W. entrance of the straits of Magellan.

DIRECTOR, in commercial polity, a person who has the management of the affairs of a trading company: thus we say the directors of the India company, South-sea company, &c. See **COMPANY**.

DIRECTOR, in surgery, a grooved probe, to direct the edge of the knife or scissors in opening sinuses or fistulæ, that the adjacent vessel, nerves, and tendons, may not be hurt. See **SURGERY**.

DIRGE, in music, a solemn and mournful composition, performed at funeral processions. The dirge was in very general use with the ancients, and was numerously filled both by voices and instruments.

DIRGHAW, or **DIRCHAU**, a fortified town of Western Prussia, in the province of Pomorellis.

DIRIBITORES, among the Romans, officers appointed to distribute tablets to the people at the comitia.

DIRIGENT, or **DIRECTRIX**, a term in geometry, signifying the line of motion along which the describent line, or surface, is carried in the genesis of any plane, or solid figure: thus, if the line AB, Plate LIV. fig. 10, move along the line AC, so that the point A always keeps in the line AC, a parallelogram, as ABCD, will be formed, of which the side AB is the describent, and the line AC the dirigent; so also, if the surface ABCD be supposed to be carried along CE, in a position always parallel to itself in its first situation, the solid ADFH will be formed, where the surface AD is the describent, and the line CE the dirigent.

DIS, an inseparable particle used in composition, implying

commonly a privative or negative signification of the word to which it is joined; as to arm, to disarm; to join, to disjoin. It is borrowed from des, used by the French and Spaniards in that sense; as desmour to untie; desterar, to banish; from the Latin *de*; as struo, to build; destruo, to destroy.

Dis signifies also a separation, detachment, &c. as disposing, distributing.

Dis, in geography, a town of Norfolk, 19 miles S. of Norwich.

Dis, in mythology, a god of the Gauls, the same as Pluto, the god of hell. The ancient inhabitants of Gaul supposed themselves descended from that deity.

DISA, a genus of the gynandria diandria class and order. Spathe one-valved; petals three, the third less, two-parted, gibbous at the base. There are four species, herbaceous plants of the Cape, with beautiful blue flowers.

DISABILITY, in law, is when a man is disabled, or made incapable to inherit any lands, or take that benefit which otherwise he might have done. This may happen four ways; 1st, by the act of an ancestor; 2d, of the party; 3d, by the act of God; or, 4th, of the law. 1. Disability by the act of the ancestor, is where the ancestor is attainted of high treason, &c. which corrupts the blood of his children, so that they may not inherit his estate. 2. Disability by the act of the party, is where a man binds himself by obligation, that, upon surrender of a lease, he will grant a new estate to a lessee; and afterwards he grants over the reversion to another, which puts it out of his power to perform it. 3. Disability by the act of God, is where a man is non sanæ memoriæ, whereby he is incapable to make any grant, &c. So that, if he passes an estate out of him, it may after his death be made void; but it is a maxim in law, "That a man of full age shall never be received to disable his own person." 4. Disability by the act of the law, without any thing by him done, is rendered incapable of the benefit of the law; as an alien born, &c.

DISANDRA, a genus of the digynia order, and heptandria class of plants. Calyx seven-leaved; corolla seven-parted, flat; capsule two-celled. It has two species, natives of Africa and Madeira.

DISAPPOINTMENT BAY, a bay on the N.W. coast of North America. Lon. 129. 0. W. Lat. 52. 15. N.

DISAPPOINTMENT, ISLAND OF, a cluster of small islands, in the South Pacific Ocean. They were discovered by Commodore Byron in 1765. These islands abound with cocoa trees, and turtles are plentiful on the coasts. Lon. from 141. 5. to 141. 16. E. Lat. from 14. 5. to 14. 10. S.

DISARMING, in law, the prohibiting of people to wear arms. It is an offence by the common law of England for persons to go or ride armed with dangerous and uncommon weapons: though gentlemen may wear common armour, according to their quality. It is also ordained by statute, that no persons shall come before the king's justices with force of arms, on pain of imprisonment, &c.

DISC, [*discus*], in antiquity, a quoit made of stone, iron, or copper, five, or six fingers broad, and more than a foot long, inclining to an oval figure, which was hurled in the manner of a bowl, to a vast distance, by the help of a leathern thong tied round the person's hand who threw it, and put through a hole in the middle.

Disc, in astronomy, the face of the Sun or Moon, such as it appears to us on the earth; or the face of the earth, such as it appears to a spectator in the Moon. The disc in eclipses is supposed to be divided into twelve equal parts, called digits; in a total eclipse of the luminaries, the whole disc is obscured; in a partial eclipse, only a part of it. See **ASTRONOMY**.

Disc, in botany, is an aggregate of florets forming, as it were, a plane surface.

Disc, in optics, is the width of the aperture of telescopic glasses, whatever their form be, whether plane, convex, concave, &c.

DISCHARGE, is where a man confined by some legal process, performs that which the law requires, and is released from the matter for which he is confined. If an obligee discharge one obligor where several are jointly bound, it discharges the others. See **ARREST**, **BOND**, **PAYMENT**.

DISCIPLE, [*discipulus*, Latin], a scholar; one that professes to receive instructions from another.

DISCIPLES, in the Christian sense, were the followers of Jesus Christ,

Christ, in general; but in a more restrained sense, the title is given to those alone who were the immediate followers and attendants on his person, of whom there were 70 or 72. The names disciple and apostle are often synonymously used in the gospel history; but sometimes the apostles are distinguished from disciples, as persons selected out of the number of disciples, to be the principal ministers of his religion: of these there were only 12. The Latins kept the festival of the 70 or 72 disciples on July 15, and the Greeks on January 4.

DISCIPLINE, in a general sense, denotes instruction and government, as military discipline, ecclesiastical discipline, &c. Ecclesiastical discipline consists in putting those laws in execution by which the church is governed, and inflicting the penalties enjoined by them against the several sorts of offenders that profess the religion of Jesus: the primitive church never pretended to exercise discipline upon any but such as were within her pale, in the largest sense, by some act of their own profession; and even upon these she never pretended to exercise her discipline so far as to cancel or disannul their baptism: all that she pretended to, was to deprive men of the benefits of external communion, such as public prayer, receiving the eucharist, and other acts of divine worship. The church discipline was only confined to the admonition of the party, and to the less and greater excommunication.

DISCLAIMER, is a plea containing an express denial, renouncing or disclaiming; as if the tenant sues a replevin upon a distress taken by the lord, and the lord avows, saying that he holds of him as his lord, and that he distrained for rent not paid, or service not performed; then the tenant denying to hold of such lord, is said to disclaim; and the lord proving the tenant to hold of him, the tenant loses his land. Co. on Lit. 102.

DISCONTINUANCE OF POSSESSION. A man may not enter upon his own lands or tenements alienated (such alienation being discontinuance of possession,) whatsoever his right be to them, of his own self or by his own authority, but must bring his writ, and seek to recover possession by law. Co. Rep. lib. 3. 85.

DISCONTINUANCE OF PROCESS, is where the plaintiff leaves a chasm in the proceedings of a cause, whereby the opportunity of prosecution is lost for that time, in which case he must begin again, and usually pays costs to the defendant, or the plaintiff is dismissed the court, &c. Every suit, whether civil or criminal, and every process therein, ought to be properly continued from day to day, &c. from its commencement to its conclusion; and the suffering of any default or gap herein, is called a discontinuance. 2 Haw. 298.

DISCONTINUANCE OF PLEA: if where divers things should be pleaded to, when some are omitted, this is a discontinuance.

DISCORD, in music, every sound which, joined with another, forms an assemblage disagreeable to the ear; or rather, every interval whose extremes do not coalesce. Now, as there are no other concords or consonances, except those which form amongst themselves, and with their fundamental sound, perfect chords, it follows, that every other interval must be a real dissonance or discord: even the third and sixth were reckoned such among the ancients, who excluded them from the number of consonant chords. The term dissonance, which is synonymous with discord, both in a literal and metaphorical sense, signifies disagreement or disunion. In reality, that which renders dissonance grating, is, that the sounds which form them, far from uniting in the ear, seem to repel each other, and are heard each by itself as two distinct sounds though produced at the same time. This repulsion or violent oscillation of sounds is heard more or less frequently coincident. When two vocal strings are gradually tuned, till they approach a consonant interval, the pulsations become slower as the chord grows more just, till at last they are scarcely heard, if heard at all; from whence it appears certain, that the pleasure produced in us by harmony results from the more or less exact and frequent coincidence of vibrations; though the reason why this coincidence should give pleasure, more than any other modification or combination of sounds, appears to us inscrutable. The agreeable effects of dissonance in harmony, are no objection to this theory; since it is allowed, that the sensations excited by discord are not in themselves immediately and necessarily pleasing, but only please by auricular deception. The ear is surprised

with the shock it receives, without being able to imagine how it should have happened; and in proportion as it is harsh and grating, we feel the pleasure of returning harmony enhanced, and the disappointment of being artfully and insensibly extricated more agreeable. The name of dissonance, is given sometimes to the interval, and sometimes to each of the sounds which form it. But though two sounds equally form a dissonance between themselves, the name is most frequently given to that sound in particular which is most extraneous to the chord. The number of possible dissonances is indefinite; but as in music we exclude all intervals which are not found in the system received, the number of dissonances is reduced to a very few: besides, in practice, we can only select from those few, such as are agreeable to the species, and the mode in which we compose; and from this last number we must exclude such as cannot be used consistently with the rules prescribed. See MUSIC.

DISCOUNT, in commerce, a term used by traders, merchants, and bankers, especially by the two former when they purchase commodities on the usual time of credit, with a condition that the seller shall allow the buyer a certain discount at the rate of so much per cent. per annum, for the time for which the credit is generally given, upon condition that the buyer pays ready money for such commodities, instead of taking the time of credit. Traders and merchants are frequently taking promissory notes for monies due payable to them or order at a certain time, and sometimes having occasion for money before the time is elapsed, procure these notes to be discounted by bankers before the time of payment. Bills of exchange are also discounted by bankers; and in this consists one article of the profits of banking. See BANK. For finding the discount of any sum for any time, see ARITHMETIC AND INTEREST.

DISCOURSE, [*discursus*,] among logicians, signifies the progressive exercise of reason in the search of truth; as when from self-evident principles it discovers the truth of something it did not know before; by means of this, a second; by that second, a third; and so on. See LOGIC.

DISCOUS, [from *discus*, Lat.] broad, flat, wide. Used by botanists to denote the middle, plain, and flat part of some flowers, such as the flos solis, &c.

DISCRETE, or DISJUNCT PROPORTION, is when the ratio of two or more pairs of numbers or quantities is the same, but there is not the same proportion between all the four numbers. Thus, if the numbers 3:6::8:16 be considered, the ratio between 3:6, is the same as that between 8:16, and therefore the numbers are proportional; but it is only discretely or disjunctly, for 3 is not to 6 as 6 to 8; that is, the proportion is broken off between 8 and 3, and is not continued as in the following continual proportionals, 3:6::12:24. See PROPORTION.

DISCRETE QUANTITY, such as is not continuous and joined together. Such is a number whose parts being distinct units, cannot be united into one continuum; for in a continuum, there are no actual determinate parts before division, but they are potentially infinite.

DISCRETIONE, in music, intimates to play or sing with attention and care.

DISCRETIVE PROPOSITIONS, are those where various judgements are made and denoted by the particles *but*, *notwithstanding*, &c. either expressed or understood. Thus, fortune may deprive me of my wealth, but not of my virtue, is a discrete proposition.

DISCUS, in antiquity, an instrument used by the ancients in their public games. It is certain it was used in the gymnastic art for preserving health and strengthening the constitution; but as to its front, its dimensions, and various uses, authors disagree. See DISC. The same exercise was performed with an instrument called *Colos*, which some distinguish from the discus, because that was made of iron, and the discus of stone; while others distinguish them by the form, the *Colos* being spherical, and the discus broad.

DISCUS, in botany. See BOTANY. It generally consists of small florets, with a hollow regular petal. It is commonly surrounded by large, plain, or flat, tongue-shaped petals, in the circumference or margin; as in daisy, groundsel, and leopard's bane: sometimes the circumference is naked, as in cotton-weed and some species of colts-foot.

DISCUS FOLII, the surface of the leaf.

DISCUSSION, in matters of literature, signifies the clear treating or handling of any particular point, or problem, so as to shake off the difficulties with which it is embarrassed: thus we say, such a point was well discussed, when it was well treated of, and cleared up.

DISCUTIENTS, in surgery, are such external remedies as, by their subtilty, dissolve or disperse a stagnating or coagulated fluid in any part of the body.

DISDIAPASON, or BISDIAPASON, in music, a compound concord, described by F. Parran, in the quadruple ratio of 4:1, or 8:2.

DISDIAPASON DIAPENTE, a concord in a sextuple ratio of 1:6.

DISDIAPASON DITONE, a compound consonance in the proportion of 10:2.

DISDIAPASON SEMI-DIAPENTE, a compound concord in the proportion of 16:3.

DISDIAPASON SEMI-DITONE, a compound concord in the proportion of 24:5.

DISEASE, that condition of the body, in which it has declined from a state of health, so that its different functions are either greatly impeded, or performed with difficulty. Of all organized creatures, man is subject to the greatest diversity of diseases: some impairing only the use of the part immediately affected; for instance, the palsy, gout, rheumatism, &c.; others disordering the whole body, such as fever, apoplexy, &c.; again others disturbing the mind, as delirium, melancholy, and the like; and lastly, some attack both mind and body, such as phrenzy, accompanied with fever. Without perplexing the reader with conjectures on the origin and propagation of diseases, we may observe, that in proportion as men associate together in large and populous places, their manners and habits become more refined; while they gradually degenerate in bodily strength, and energy of mind, so that they are less capable of resisting the noxious agency of the elements, and other external powers. This progress towards refinement is always attended with an increase of luxury, the painful effects of which are sooner or later experienced by its votaries. Luxury, indeed, has also afforded the means of lessening the sudden influence of cold, heat, rain, moisture, and other external causes; for we can occasionally guard against their severity; but, on their next return, we are liable to be acted upon with additional vehemence. To this state of things we owe the introduction of many articles, both of food and dress, the consequences of which too frequently prove to be injurious to our bodily welfare. Thus it may be safely affirmed, that the number and variety of diseases, in a great measure depend upon the prevailing refinements in the extensive department of luxury. The passions are another fruitful source of disorders. Man is perhaps more violently attacked, and more obstinately governed, by them than any other creature. These emotions variously affect the human body: the most hurtful and oppressive of them, however, are terror and grief; the former in particular is often attended with the most fatal effects. The remedies to which we resort during the prevalence of passion, too frequently lay the foundation of lingering disorders both mental and corporeal, in which medicine can afford but precarious relief. The last source of diseases to which we shall allude, is a variety of specific contagions; the greater part of which is probably generated in the atmosphere. Such is particularly the case with respect to air that is vitiated by putrid, marshy, or noxious vapours, and by the unwholesome effluvia of various manufacturing processes, especially those of combustion, fermentation, and putrefaction. Lastly, there is another and very numerous class of contagious maladies, that perpetually migrate from one individual to another, such as the small-pox, measles, hooping-cough, influenza, putrid fevers, &c. Every disease weakens the digestive powers. The diet ought therefore in all cases to be light and easy of digestion. Paying due attention to this circumstance alone, without having recourse to those pernicious nostrums and pretended specifics, now in general circulation, will in a very great measure contribute to the recovery of the patient. Medicines are doubtless of considerable utility, when properly and opportunely administered; but an indiscriminate use of drugs (such as prevails among the ignorant and fanciful,) cannot fail to be productive of the worst consequences.

DISEASES OF HORSES. See FARRIERY.

DISEASES OF PLANTS. See HUSBANDRY.

DISEMBOGUE, in the sea-language, is said of a ship that passes out of a gulph or bay into the open sea; a river is also said to disembogue or discharge itself into the sea.

DISENTIS, one of the eight jurisdictions in the superior part of the Grison league; situated about the sources of the Rhine. It is mountainous and fertile.

DISENTS, the capital of the above territory, situated near the sources of the Rhine.

DISGUISE, in law. Persons doing unlawful acts in disguise are by our statutes subjected to great penalties, and even declared felons. Thus by an act, commonly called the black act, persons appearing disguised and armed in a forest or grounds inclosed, or hunting deer, or robbing a warren or a fish-pond, are declared felons.

DISH, in mining, is a trough made of wood, about 28 inches long, four inches deep, and six inches wide; by which all miners measure their ore. If any be taken selling their ore, not first measuring it by the bar-master's dish, and paying the king's duty, the seller forfeits his ore, and the buyer forfeits for every such offence 40 shillings to the lord of the field or farmer.

DISHERISON, a term used in old writers for disinheriting.

DISJUNCT PROPORTION, the same with that otherwise called discrete. See DISCRETE.

DISJUNCTIVE, something that separates or disjoins. Thus, *or, neither, &c.* which in connecting a discourse separate the parts of it, are called disjunctive conjunctions.

DISJUNCTIVE PROPOSITION, in logic, is that where, of several predicates, we affirm one necessarily to belong to the subject to the exclusion of all the rest, but leave that particular one undetermined. Such is the major of the following disjunctive syllogism:

The world is either self-existent, or the work of some finite, or of some infinite being.

But it is not self-existent, nor the work of a finite being.

Therefore it is the work of an infinite being.

DISK, or DISC. See DISC and DISCUS.

DISLOCATION, in surgery, the same with luxation. See SURGERY.

DISMISSION OF A BILL, in chancery. If the plaintiff does not attend on the day fixed for the hearing, his bill is dismissed with costs. It may be also dismissed for want of prosecution, which is in the nature of a non-suit at law, if he suffer three terms to elapse without moving forwards in the cause.

DISEMBEMBERED, in heraldry, is applied to birds that have neither feet nor legs, and also to lions and other animals whose members are separated.

DISMES, [*decimæ*, Lat.] a term formerly used for tithes. See TITHE.

DISMOUNTING, in the military art, the act of unhorsing. Thus to dismount the cavalry, dragoons, &c. is to make them alight.

DISMOUNTING CANNON, is the breaking of their carriages, wheels, axletrees, or any thing else, so as to render them unfit for service.

DISPARAGEMENT, in our law, is properly used for the matching an heir in marriage under his degree, or against decency.

DISPARATES, [*disparata*, Lat.] things so unlike that they cannot be compared with each other.

DISPART, in gunnery, is the mark set upon the muzzle ring of a piece of ordnance, so that a sight line taken upon the top of the base ring against the touch-hole, by the mark set on or near the muzzle, may be parallel to the axis of the concave cylinder. The common way of doing this, is to take the two diameters of the base ring, and of the place where the dispart is to stand, and divide the difference between them into two equal parts, one of which will be the length of the dispart, which is set on the gun with wax or pitch, or fastened there with a piece of twine or marline. By means of an instrument it may be done with all possible nicety.

DISPATCH, a letter on some affair of state, or other business of importance, sent with care and expedition, by a courier express. The business of dispatches lies on the secretaries of state and their clerks. The king gives directions to his ministers abroad by

by dispatches. The word is also used for the packet or mail containing such letters.

DISPENSARY, a kind of charitable institution, of late years very prevalent in Britain; particularly in London, Edinburgh, Newcastle, Dundee, Kelso, &c. They are distinguished by different titles, as the General Dispensary, the Royal Universal Dispensary, &c. They are supported by voluntary subscriptions, have each one or more physicians and surgeons, whose business is to attend at stated times, to prescribe for the poor; and, if necessary, to visit them at their own habitations. It is in this latter respect, that the patients of a dispensary differ from those called out-patients at an hospital. The poor are supplied gratis with medicines, and many of these institutions also afford gratuitous assistance to lying-in women. Formerly there were three dispensaries established in London, for selling medicines to the poor at prime cost, under the direction of the College of Physicians. In China, the medicines are not dispensed gratis, but money is given to the poor to purchase them. The Chinese have a stone, ten cubits high, erected in the public squares of their cities: on this stone are engraved the names of all sorts of medicines with the price of each; and when the poor stand in need of any relief from physic, they go to the treasury, where they receive the price each medicine is rated at.

DISPENSARY, or DISPENSATORY, denotes a book containing the method of preparing the various kinds of medicines used in pharmacy. Such are those of Bauderon, Quercetan, Zwelfer, Chara, Bates, Mesue, Salmon, Lemery, Quincy, &c. but the latest and most esteemed, besides the London and Edinburgh Pharmacopœias, is the Edinburgh New Dispensary, being an improvement upon that of Dr. Lewis.

DISPENSATION, in law, the granting of a licence of doing some certain action that otherwise is not permitted. The greatest dealer in dispensations is the Pope, who claims the office *jure divino*, and extends it to every thing. The more moderate of the Romanists themselves deny that he can give a dispensation for any thing contrary to the divine law, or the law of nature; and confine him to what is contrary to positive laws, or to things relating to fasts, marriages, holding several benefices, &c. and they limit him even in these things. The archbishop of Canterbury has a power, by statute, of dispensing in any cause wherein dispensations were formerly granted by the see of Rome; and as well to the king as his subjects; and during the vacancy of the archbishop's see, the guardian of the spiritualities may grant dispensations.

DISPERSION, in optics, the same with the divergency of the rays of light.

DISPERSION OF INFLAMMATION, in medicine and surgery is the removing of the inflammation, and restoring of the inflamed part to its natural state.

DISPERSION, POINT OF, in dioptrics, the point from which refracted rays begin to diverge, where their refraction renders them divergent.

DISPLAYED, in heraldry, is applied to the position of an eagle, or any other bird, when it is erect, with its wings expanded.

DISPONDEE, or DISPONDEUS, in the Greek and Latin poetry, a double spondee or foot, consisting of four long syllables; as *ἄνθρωπος*, *ἡλιόφωτος*.

DISPOSITION, in architecture, the just placing of the several parts of an edifice according to their nature and office.

DISPOSITION, in human nature. In every man there is something original, that serves to distinguish him from others, that tends to form a character, and to make him meek or fiery, candid or deceitful, resolute or timorous, cheerful or morose. This original bent, termed disposition, must be distinguished from a principle: the latter signifying a law of human nature, makes part of the common nature of man; the former makes part of the nature of this or that man. Propensity is a name common to both; for it signifies a principle as well as a disposition.

DISPOSITION, in oratory. See **ORATORY**.

DISPOSITION, in painting. See **PAINTING**.

DISPOSITION, in Scots law, a deed or writing which contains the grant of any subject: when applied to heritable subjects, it in some cases gets the name of charter, which differs from a disposition in nothing else than a few immaterial forms.

DISPROPORTION, a general term for any kind of irregularity, or want of proportion in the parts of a thing. See **PROPORTION**.

DISPROVING, in rhetoric and logic, the same with refutation. See **REFUTATION**.

DISPUTATION, in the schools, a contest, either by word or writing, on some point of learning for a degree, prize, or for an exercise. See **DEGREE** and **THESIS**.

DISQUISITION, a serious and exact examination into the circumstances of any affair, in order to discourse clearly about it. See **REASONING**, and **LOGIC**.

DISSECTION, in anatomy, the cutting up of a body, with a view of examining the structure and use of the parts. See **ANATOMY**.

DISSEISIN, in law, an unlawful dispossessing of a person of his lands or tenements. It is of two sorts, either single disseisin, which is committed without force of arms, or disseisin by force of arms, more properly termed deforcement. The disturbing of a person from entering on his land, or hindering of him from tilling it, are both disseisins of land; and denial of rent, when lawfully demanded, is a disseisin of the rent. If a disseisor, after he has expelled the right owner, gains peaceable possession of the lands five years, without claim, and continues in possession so as to die seised, and the land descends to his heirs, they will have a right to the possession till the owner recovers at law; and here the owner shall lose his estate for ever, if he do not prosecute his suit within the time limited by the statute of limitations.

DISSEISOR, a person who is guilty of disseisin.

DISSENTERS, separatists from the service and worship of the church of England. At the revolution a law was enacted, that the statutes of queen Elizabeth and king James I. concerning the discipline of the church, should not extend to the Protestant dissenters. Persons dissenting, however, are to subscribe the declaration of 30 Car. II. cap. 1. and take the oaths of fidelity, &c. Besides, they are not to hold their meetings till their place of worship is certified to the bishop, or to the justices of the quarter-sessions, and registered. Also they are not to keep the doors of their meeting-houses locked during the time of divine service. And to secure to them the free exercise of their religion, whoever disturbs or molests them in the performance of divine worship, on conviction at the sessions is to forfeit twenty pounds by the statute 1 William and Mary. Unless dissenters conform and receive the sacrament as administered by the church of England, they are excluded from holding any public places under the government. Dissenters chosen to any parochial or ward offices, and scrupling to take the oaths, may execute the office by deputy, who shall comply with the law in this behalf. But it seems they are not subject to fine, on refusing to serve corporation offices; for they may object to the validity of their election, on the ground of their own non-conformity.

DISSIMILAR, in general, an appellation given to things which are unlike: thus the seminal of first leaves of plants, are called dissimilar, as being generally of a different figure from those of the grown plants.

DISSIMILAR PARTS, in anatomy, those compounded of parts of various structure, such are all the limbs of the body.

DISSIMILITUDE, in general, denotes whatever constitutes the difference between two dissimilar things.

DISSIMILITUDE, in rhetoric, an argument wherein from dissimilar, or unlike things, other dissimilars are deduced, as in the following argument from Catullus.

Soles occidere & redire possunt.

Nobis cum semel occidit brevis lux,

Nox est perpetua una dormienda.

Voss. de institut. orator.

DISSIPATION, in physics, an insensible loss or consumption of the minute parts of the body; or that flux whereby they fly off, and are lost. See **EFFLUVIA**.

DISSIPATION, CIRCLE OF, in optics, is used for that circular space upon the retina, which is taken up by one of the extreme pencils or rays issuing from an object.

DISSOLVENT, in general, whatever dissolves or reduces a solid body into such minute parts as to be sustained in a fluid.

DISSOLUTION, in chemistry, the same with solution.

DISSOLUTION, in music, is when a sound in the enharmonic genus is lowered three dieses; for thereby that genus is dissolved, and the music, or that interval at least, is chromatic.

DISSONANCE, in music, the same with discord. See **DISCORD**.

DISSYLLABLE,

DISSYLLABLE, among grammarians, a word consisting only of two syllables; such are nature, science, &c.

DISTAFF, an instrument about which flax is tied in order to be spun.

DISTANCE, in general, an interval between two things, either with regard to time or place. See **METAPHYSICS**.

DISTANCES, **ACCESSIBLE**, in geometry, are such as may be measured by the chain, &c. See **CHAIN**, **THEODOLITE**.

DISTANCES, **INACCESSIBLE**, are such as cannot be measured by the chain, &c. by reason of some river, or the like, which obstructs our passing from one object to another. See **GEOMETRY** and **TRIGONOMETRY**.

DISTANCE, in navigation, the number of minutes or leagues a ship has sailed from any given place or point. See **NAVIGATION** and **MENSURATION**.

DISTANCE, in astronomy. The distance of the sun, planets, and comets, is only found from their parallax, as it cannot be found either by eclipses or their different phases: for from the theory of the motions of the earth and planets we know, at any time, the proportion of the distances of the sun and planets from us; and the horizontal parallaxes are in a reciprocal proportion to these distances. See **ASTRONOMY**.

DISTANCE, **CURTATE**, in astronomy, is the distance of the planet's place, reduced to the ecliptic, from the sun.

DISTANCE OF THE BASTIONS, in fortification, is the side of the exterior polygon.

DISTANCE OF THE EYE, in perspective, is a line drawn from the eye to the centre of the picture. See **PERSPECTIVE**.

DISTEMPER is frequently used in the same sense as disease, but is particularly applicable to cattle. This term implies a species of contagious fever, attended with an inflammation, which is succeeded by a gangrene in the lungs, liver, or intestines. It is always preceded by a shivering and trembling of the limbs, which are followed by various febrile symptoms, such as difficulty of breathing, a sinking in the flanks, and a dryness on the tongue, together with a loathing of the usual food and drink, great heaviness and debility. Animals affected with the distemper, frequently shed tears; their eyes appear sometimes sparkling and inflamed, but at intervals dull and languid. Their food remains crude in the stomach for several days after it has been eaten, from their inability to digest it. This contagion spread most rapidly in the early part, and about the middle of last century, over several provinces in France, whence it reached this country, and destroyed great numbers of cattle. Various causes of this malady have been assigned, but that most generally admitted, is the turning of cattle into rank grass, especially after heavy and frequent showers. Different remedies were then adopted, the best of which appears to be bleeding the infected animal in the earlier stages of the disorder; and the internal use of the Peruvian bark and red wine; or, if these should fail to procure relief, a mixture of that drug and of burdock, about half an ounce of each, pulverized, may be given twice nightly, for two or three succeeding nights, in warm water, which will seldom fail of effecting a cure.

DISTEMPER, in painting, a term used for the working up of colours with something besides water or oil. If the colours are prepared with water, that kind of painting is called limning; and if with oil, is called painting in oil, and simply painting. If the colours are mixed with size, whites of eggs, or any such proper glutinous or unctuous matter, and not with oil, then they say it is done in distemper.

DISTENSION, [*distensio*, Lat.] among ancient musicians, is used in a synonymous sense with interval. See **INTERVAL**.

DISTICH, [*distichon*,] a couplet of verses making a complete sense. Thus hexameter and pentameter verses are disposed in distichs.

DISTICHIASIS, in surgery, a disease of the eye-lids, when under the ordinary eye-lashes there grows another extraordinary row of hair, which frequently eradicates the former, and pricking the membrane of the eye, excites pain, and brings on a defluxion.

DISTILLATION, a chemical process employed to separate liquids from those parts of bodies which are more fixed, whether solid or liquid; the process by which the solid parts of bodies are separated is called sublimation. See **CHEMISTRY**. The apparatus employed for distillation are of several varieties, suited to the nature

of the volatile body. That employed for the distillation of water, alcohol, and essential oils, is called a still. It is chiefly made of copper, and ought to be so constructed, that as great an evaporable surface as possible may be exposed. The vapour which comes from the still, is condensed by causing it to pass through a spiral tube, fitted into the inside of a tub, which is filled with cold water, and so contrived, that the product of the distillation shall have no communication with the external water. This tub, which is called a worm tub, should be supplied with cold water at the bottom, while the warm water, caused by the condensation of the vapour, should be made to run off at the top. The apparatus employed for distilling bodies more easily condensable, consist of two parts, one called the retort, containing the substance to be distilled, and the other the receiver, because it receives the substance raised from the retort. In the distillation of bodies which afford permanent gasses as well as condensable matters, in addition to the receiver, a number of connected vessels are employed, constituting what, from its inventor is called a Woulfe's apparatus, in which, what is not condensed, or absorbed in the first bottle, passes forward to the second, and so on to the third and fourth, till at length the absolutely incondensable part is received into a vessel called a gasometer. Before the invention of this apparatus, this kind of distillation was attended with great danger, both to the apparatus and the operator; the receiver being very liable to burst, and the fumes being intolerably suffocating. Both these inconveniences are completely obviated by the invention of the Woulfe's apparatus. See **CHEMISTRY**. Sometimes an apparatus called an alembic is used for distillation; it is generally of glass, and is used for experiments in the small way; it consists of a bottle holding the substance to be distilled, having a dome-like head, furnished with a channel to convey the condensed vapour. There are various modes of applying heat in distillation, depending upon the nature of the apparatus employed, as well as upon the substance to be distilled. The common still, which is of metal, is immediately exposed to the naked fire, since from its tenacity, and its property of conducting heat with facility, it is not liable to crack, which is not the case with glass and earthen ware. If the vessel holding the substance to be distilled, be of the latter kind, it is essential to apply the heat very gradually and uniformly, and after the process, to suffer it to cool in a similar manner. This is effected in different ways; the most common of which is the sand-bath. In experiments in the small way, the lamp will answer every purpose of the sand-bath, as the sliding rest containing the retort, admits of its being placed at any given distance from the flame. In addition to this, the Argand lamp can be adjusted by the rack, to almost any degree of intensity below its maximum. Another method of defending the retort from the too rapid effect of the heat, consists in coating the outside with a mixture of horse-dung and clay, or loam. When a limited degree of heat is required in distillation, recourse is had to a bath of some liquid, whose boiling point will give the degree of heat required, such as water, oil, or mercury. If the different bodies subjected to distillation had no chemical affinity for each other, it is probable that each substance would put on its elastic form, only at that temperature at which it would, in a separate state, be converted into vapour. But we frequently find, that one volatile substance will carry along with it other bodies of considerable fixity. From the affinity which water has to air, we observe the evaporation of the former to take place at all temperatures below its boiling point; and though it has been thought that water might be freed from saline matter by distillation, it is found by experiment, that several salts are carried over along with the vapour of the water, which in their dry state would undergo decomposition before they would be induced to assume the elastic form. Hence water, by the common mode of distillation, cannot be rendered pure. From the circumstance, that the air is capable of raising water and other liquids at a low temperature, we are enabled to perform the distillation of such liquids, by making the slightest degree of difference of temperature between the retort and the receiver. Water and alcohol may be obtained perfectly pure, by placing the retort in the temperature of 100°, and the receiver in that of 50° of Fahrenheit's scale. The salts most liable to rise with water in distillation are carbonate ammonia, muriates of lime and magnesia, and nitrate of soda. Indeed this tendency appears to be directly, as the solubility of the salt, or rather as its deliquescent property, which is as its affinity for water.

The objects of distillation, considered as a trade distinct from the other branches of chemistry, are chiefly spirituous liquors, and those waters impregnated with the essential oil of plants, commonly called simple distilled waters. The distilling of compound spirits and waters is reckoned a different branch of business, and they who deal in that way are commonly called rectifiers. This difference, however, though it exists among commercial people, is not at all founded in the nature of the thing; compound spirits being made, and simple spirits being rectified, by the very same operations by which they are at first distilled, or at least with very trifling alterations. The great object with every distiller ought to be, to procure a spirit perfectly flavourless, or at least as well freed from any particular flavour as may be; and in this country the procuring of such a spirit is no easy matter. The only materials for distillation, that have been used in large quantity, are malt and molasses, or treacle. Both these, especially the first, abound with an oily matter, which, rising along with the spirit, communicates a disagreeable flavour to it, and from which it can scarce be freed afterwards by any means whatever. To dissipate this essential oil, it has been proposed to inspissate the wort into a thin extract like a syrup; afterwards to thin it with water, and ferment it in the usual manner. This certainly promises great success; there is no subject we know of, that is possessed of any kind of essential oil, but what will part with it by distillation, or by long boiling. The inspissating of the wort, however, does not seem to be either necessary, or safe to be attempted; for, in this case, there is great danger of its contracting an empyreuma, which never could be remedied. The quantity lost by evaporation, therefore, might be occasionally added, with an equal certainty of dissipating the obnoxious oil. Whether the yield of spirit would be as great in this case as in the other, is a question that can by no means be decided without further experiments. Previous to the operation of distilling, those of brewing and fermentation are necessary. See BREWING. The fermentation ought always to be carried on as slowly as possible, and performed in vessels closely stopped; only having at the bung a valve pressed down by a spring, which will yield with less force than is sufficient to burst the vessel. It should even be allowed to remain till it has become perfectly fine and transparent; as the spirit will thus not only be superior in quantity, but also in fragrance, pungency, and vinosity, to that commonly produced. As to the operation of distilling, only one general rule can be given, viz. to let the heat, in all cases, be as gentle as possible. Accidents will be effectually prevented by having the worm of a proper wideness, and by rectifying the spirits in a water bath; which, if sufficiently large, will perform the operation with all the dispatch requisite for the most extensive business. The vessel in which the rectification is performed, ought to be covered with water up to the neck, and to be loaded with lead at the bottom, so that it may sink in the water. Thus the operation will go on as quickly as if it was on an open fire, and without the least danger of a miscarriage; nor will it ever be necessary to make the water in the bath come to a boiling heat. As the end of rectification is to make the spirit clean as well as strong, or to deprive it of the essential oil as well as the aqueous part, it will be proper to have regard to this even in the first distillation. For this purpose, the spirit, as it first comes over, should be received into a quantity of cold water; as the connection betwixt it and the oily matter will thus be considerably lessened. After this, it should be again mixed with an equal quantity of water, and distilled a second time. Thus the spirit will be freed from most of the oily matter, even though it had been very much impregnated with it at first. But, as by using such a quantity of water, a considerable part of the water will be left in the residuum of each rectification, all these residuums, must be mixed together, and distilled on an open fire, with a brisk heat, that the remainder of the spirit may be got out. After the spirit has been distilled once or twice in this manner from water, it may be distilled in a water-bath without any addition; and this last rectification will free it from most of the water it contains. One very great desideratum among the distillers of this country is, a method of imitating the foreign spirits, brandy, rum, gin, &c. to a tolerable degree of perfection; and notwithstanding the many attempts that are daily made for this purpose, the success, in general, has been but very indifferent. On this subject, Mr. Cooper has the following observations, in his "Complete System of Distillation;" which, as they are applicable to all other spirits as well as brandy, we shall here quote: "The general me-

thod of distilling brandies in France need not be formally described, as it differs in nothing from that practised here in working from malt-wash or molasses; nor are they in the least more cleanly or exact in the operation. They only observe more particularly to throw in a little of the natural ley into the still along with the wine, as finding this gives their spirit the flavour, for which it is generally admired abroad. But, though brandy is extracted from wine, experience tells us that there is a great difference in the grapes from which the wine is made. Every soil, every climate, every kind of grapes, varies with regard to the quantity and quality of the spirits extracted from them. A large quantity of brandy is distilled in France during the time of the vintage; for all those poor grapes that prove unfit for wine, are usually first gathered, pressed, their juice fermented, and directly distilled. This rids their hands of their poor wines at once, and leaves their casks empty for the reception of better. It is a general rule with them not to distil wine that will fetch any price as wine; for, in this state, the profits upon them are vastly greater than when reduced to brandies. This large stock of small wines, with which they are almost over-run in France, sufficiently accounts for their making such vast quantities of brandy in that country, more than in other places which lie in warmer climates, and are much better adapted to the production of grapes. Nor is this the only fund of their brandies: for all the wine that turns eager, is also condemned to the still; and, in short, all that they can neither export nor consume at home, which amounts to a large quantity; since much of the wine laid in for their family provision is so poor as not to keep during the time of spending. Hence many of our English spirits, with proper management, are convertible into brandies hardly distinguishable from the foreign in many respects, provided the operation be neatly performed. The best, and indeed the only method of imitating French brandies to perfection, is by an essential oil of wine; this being the very thing that gives the French brandies their flavour. But to use even this ingredient to advantage, a pure tasteless spirit must first be procured; for it is ridiculous to expect that this essential oil should be able to give the agreeable flavour of French brandies to our fulsome malt spirit, already loaded with its own nauseous oil, or strongly impregnated with a livid taste from the alkaline salts used in rectification. The method of procuring this essential oil of wine, is this: Take some cakes of dry wine-lees, such as are used by our hatters; dissolve them in six or eight times their weight of water; distil the liquor with a slow fire, and separate the oil with a separating glass; reserving for the nicest uses only that which comes over first, the succeeding oil being coarser and more resinous. This fine oil of wine may be mixed into a quintessence with pure alcohol; by which means it may be preserved a long time fully possessed of all its flavour and virtues; but, without such management, it will soon grow resinous and rancid. When a fine essential oil of wine is thus procured, and also a pure and insipid spirit, French brandies may be imitated to perfection. The essential oil, however, must be drawn from the same kind of lees as the brandy to be imitated was procured from. In order to imitate Coniac brandy, it will be necessary to distil the essential oil from Coniac lees; and the same for any other kind of brandy. For, as different brandies have different flavours, and as these flavours are entirely owing to the essential oil of the grape, it would be preposterous to endeavour to imitate the flavour of Coniac brandy with an essential oil procured from the lees of Bourdeaux wine. When the flavour of the brandy is well imitated by a proper dose of the essential oil, and the whole reduced into one simple and homogeneous fluid, other difficulties are still behind: the flavour, though the essential part, is not, however, the only one; the colour, the proof, and the softness, must also be regarded, before a spirit that perfectly resembles brandy can be procured. With regard to the proof, it may be easily hit, by using a spirit rectified above proof; which, after being intimately mixed with the essential oil of wine, may be let down to a proper standard with fair water. And the softness may, in a great measure, be obtained by distilling and rectifying the spirit with a gentle fire; and what is wanting of this criterion in the liquor when first made, will be supplied by time: for it is time alone that gives this property to French brandies; they being at first acrid, foul, and fiery. But, with regard to the colour, a particular method is required to imitate it to perfection. A small quantity of the extract of oak, or the shavings of that wood, properly digested, will furnish us with a tincture capable of giving the spirit

spirit any degree of colour required. There are other methods in use for colouring brandies; but the best, besides the extract of oak, are treacle and burnt sugar. The treacle gives the spirit a fine colour, nearly resembling that of French brandy; but as its colour is dilute, a large quantity must be used: this is not, however, attended with any bad consequences; for notwithstanding the spirit is really weakened by this addition, yet the bubble proof, the general criterion of spirits, is greatly mended by the tenacity imparted to the liquor by the treacle. The spirit also acquires from the mixture a sweetish or luscious taste, and a fulness in the mouth; both which properties render it very agreeable to many people. A much smaller quantity of burnt sugar than of treacle will be sufficient for colouring the same quantity of spirits: the taste is also very different; for instead of the sweetness imparted by the treacle, the spirit acquires from the burnt sugar an agreeable bitterness, and by that means recommends itself to nicer palates, which are offended with a luscious spirit. The burnt sugar is prepared by dissolving a proper quantity of sugar in a little water, and scorching it over the fire till it acquires a black colour. Either treacle or burnt sugar will nearly imitate the genuine colour of old French brandy; but neither of them will succeed when put to the test of the vitriolic solution. The spirit distilled from molasses or treacle is very clean and pure. It is made from common treacle dissolved in water, and fermented in the same manner as the wash for the common malt spirit. But if some particular art be not used in distilling this spirit, it will not prove so vinous as malt spirit, but more flat and less pungent and acrid, though otherwise much cleaner tasted, as its essential oil is of a much less offensive flavour. Therefore, if good fresh wine lees, abounding in tartar, be added and duly fermented with the molasses, the spirit will acquire a much greater vinosity and briskness, and approach much nearer to the nature of foreign spirits. Where the molasses spirit is brought to the common proof-strength, if it be found not to have a sufficient vinosity, it will be very proper to add some good dulcified spirit of nitre; and if the spirit be clean worked, it may, by this addition only, be made to pass on ordinary judges for French brandy. Great quantities of this spirit are used in adulterating foreign brandy, rum, and arrack. Much of it is also used alone in making cherry brandy and other drams by infusion; in all which many, and perhaps with justice, prefer it to foreign brandies. Molasses, like all other spirits, are entirely colourless when first extracted; but distillers always give it as nearly as possible the colour of foreign spirits. If these principles hold good, the imitation of foreign spirits of all kinds must be an easy matter. It will only cost the procuring of some of those substances from which the spirit is drawn; and distilling this with water, the essential oil will always give the flavour desired. Thus, to imitate Jamaica rum, it will only be necessary to procure some of the tops, or other useless parts of the sugar-canes; from which an essential oil being drawn, and mixed with clean molasses spirit, it will give it the true flavour. The principal difficulty must lie in procuring a spirit totally, or nearly, free of all flavour of its own. The spirit drawn from the refuse of a sugar-house is by our author commended as superior to that drawn from molasses. The only method, therefore, of imitating foreign spirits is, by choosing such materials as will yield a spirit flavoured as much like them as possible. The materials most recommended by our author in this case, and probably the best that can be used, are raisins. Concerning these he gives the following directions: "To extract this spirit, the raisins must be infused in a proper quantity of water, and fermented in the manner already directed. When the fermentation is completed, the whole is to be thrown into the still, and the spirit extracted by a strong fire. The reason why we here direct a strong fire is, because by that means a greater quantity of the essential oil will come over the helm with the spirit, which will render it fitter for the distiller's purpose: for this spirit is commonly used to mix with the common malt goods: and it is surprising how far it will go in this respect; ten gallons of it being often sufficient to give a determining flavour and agreeable vinosity to a whole piece of malt spirits. It is therefore well worth the distiller's while to endeavour at improving the common method of extracting spirits from raisins; and perhaps the following hint may merit attention. When the fermentation is completed, and the still charged with fermented liquor as above directed, let the whole be drawn off with as brisk a fire as possible; but, instead of the cask

or can, generally used by distillers for a receiver, let a large glass, called by chemists a separating glass, be placed under the nose of the worm, and a common receiver applied to the spout of the separating glass: by this means the essential oil will swim upon the top of the spirit, or rather low wine, in the separating glass, and may be easily preserved at the end of the operation. The use of this limpid essential oil is well known to distillers; for in this resides the whole flavour, and consequently it may be used to the greatest advantage in giving that distinguishing taste and true vinosity to the common malt spirits. After the oil is separated from the low wine, the liquor may be rectified in *balneo marie* into a pure and almost tasteless spirit, and therefore well adapted to make the finest compound cordials, or to imitate or mix with the finest French brandies, arracks, &c. In the same manner a spirit may be obtained from cyder. But as its particular flavour is not so desirable as that obtained from raisins, it should be distilled in a more gentle manner, and carefully rectified according to the directions we have already given."

DISTILLATION OF COMPOUND SPIRITS. The following general rules are very easy to be learned and practised. 1. The artist must always be careful to use a well cleansed spirit, or one freed from its own essential oil. For, as a compound water is nothing more than a spirit impregnated with the essential oil of the ingredients, it is necessary that the spirit should have deposited its own. 2. Let the time of previous digestion be proportioned to the tenacity of the ingredients, or the ponderosity of their oil. 3. Let the strength of the fire also be proportioned to the ponderosity of the oil intended to be raised with the spirit. 4. Let only a due proportion of the finest parts of the essential oil be united with the spirit; the grosser and less fragrant parts of the oil not giving the spirit so agreeable a flavour, and at the same time rendering it unsightly. This may in a great measure be effected by leaving out the faints, and making up to proof with fine soft water in their stead. A careful observation of these rules will render this part of distillation much more perfect than it is at present. Nor will there be any occasion for the use of burnt alum, white of eggs, singlass, &c. to fine down cordial waters; for they will presently be fine, sweet, and pleasant tasted, without any further trouble. We subjoin a few receipts for making some of those compound waters, or spirits, that are in the most general estimation.

DISTILLATION OF ANISEED WATER. Take of aniseed bruised, two pounds; proof spirit, 12½ gallons; water, one gallon: draw off ten gallons with a moderate fire. This water should never be reduced below proof; because the large quantity of oil with which it is impregnated, will render the goods milky and foul when brought down below proof. But if there be a necessity for doing this, their transparency may be restored by filtration.

DISTILLATION OF CARDAMUM, or ALL-FOURS. Take of pimento, caraway, coriander seeds, and lemon peel, each 3lb.; of malt spirits, 11 gallons; water, 3 gallons. Draw off with a gentle fire, dulcify with common sugar, and make up the strength desired with clear water. This is a dram greatly used in some countries.

DISTILLATION OF CINNAMON WATER. Take 8lb. of fine cinnamon bruised, 17 gallons of clean rectified spirits, and two gallons of water. Put them into the still, and digest them twenty-four hours with a gentle heat; after which draw off 16 gallons with a pretty strong heat. Cinnamon water of this strength is called strong cinnamon water. A cheaper spirit but of an inferior quality, may be obtained by using cassia lignea instead of cinnamon. To dulcify cinnamon water, take double refined sugar, about two pounds to a gallon; and dissolve it in the spirit, after making it up proof with clean water. One general caution is here necessary, viz. near the end of the operation, carefully to watch the spirit as it runs into the receiver, to prevent the faints from mixing with the goods. This may be discovered by often catching some of it as it runs from the worm in a glass, and observing whether it is fine and transparent; for as soon as the faints begin to rise, the spirit will have a blueish cast. As soon as this colour is perceived, the receiver must immediately be changed; for if the faints are suffered to mix with the rest, the value will be greatly lessened. The distillers call such as are made up proof, double goods; and those below proof, single.

DISTILLATION OF CITRON WATER. Take of dry yellow rinds of citrons, three pounds; of orange-peel, 2lb. nutmegs, 9 bruised,

bruised, $\frac{2}{3}$ of a pound; clean proof spirit, $10\frac{1}{2}$ gallons; water, one gallon: digest in a gentle heat; then draw off ten gallons in balneo marie, and dulcify with fine sugar.

DISTILLATION OF HOLLANDS GIN. The ingredients used by the Dutch are the same with those above-mentioned, only, instead of malt spirits, they use French brandy. But from what has been already observed concerning the nature of these kinds of spirits, it is easy to see, that by the help of a well-rectified spirit, geneva may be made in this country at least nearly equal to the Dutch, provided it is kept to a proper age; for all spirituous liquors contract a mellowness by age, impossible to be imitated any other way. The following is the process of preparing Holland gin, according to the best Dutch distillers. Their grist is composed of ten quarters of malt, ground considerably finer than our malt-distillers' barley grist, and three quarters of rye-meal; or, more frequently, of ten quarters of rye and three quarters of malt-meal. The ten quarters are first mashed with the least quantity of cold water it is possible to blend it up with; when uniformly incorporated, as much boiling water is added as forms it into a thin batter; it is then put into one, two, or more casks, or gyle tuns, with a much less quantity of yeast than is usually employed by our distillers. Generally on the third day they add the malt or rye meal, previously made into a kind of lob, prepared in a similar manner, except in not being so diluted; but not before it comes to the temperature of the fermenting wash; at the same time adding full as much yeast as when at first setting the backs. The principal secret in the management of the mashing part of the business is, in first thoroughly mixing the malt with the cold water, and in subsequently adding the due proportion of boiling water, that it may still remain sufficiently diluted after the addition of the fine meal under the form of lob, and in well rousing all together in the back, that the wash may yet be dilute enough for distilling, without endangering its burning to the bottom of the still. Thus they commodiously reduce the business of brewing and fermenting to one operation. By using cold water to uniformly wet the malt, all danger of clogging the spending of the tap would be necessarily avoided; but here is no occasion to do any thing more, than sufficiently dilute the wash, consisting of the whole of the grain, thin enough to be fermented and distilled together, by which means the spirit of the bran and husky part, as well as of the flour of the grain, are completely extracted, yet their wash, compared with ours, is about three-eighths thinner. For these reasons they obtain more spirit from their grain than we do, and of a better quality, with not half the trouble taken by our distillers. Rectification into Holland gin. To every twenty gallons of spirit of the second extraction, about the strength of proof spirit, take three pounds of juniper berries, and two ounces of oil of juniper, and distil with a slow fire until the feints begin to rise, then change the receiving can; this produces the best Rotterdam gin. An inferior kind is made with a still less proportion of berries, sweet fennel seeds, and Strasburgh turpentine, without a drop of juniper-oil. In Plate LIV. fig. 11, is the representation of the common still. It is a large copper vessel, A, into which the materials are put. The still is built up in brick-work: the fire is applied underneath, and runs round it in a spiral manner. B is the head of the still, which is connected with the worm at x. The worm C is a spiral tube, immersed in a vessel of cold water, called the refrigeratory. The liquor being condensed in its passage through the worm, runs out at the cock D into the vessel Z, placed there to receive it.

DISTILLATION OF LEMON WATER. Take of dried lemon peel, 4lb. clean proof spirit, $10\frac{1}{2}$ gallons, and one gallon of water. Draw off 10 gallons by a gentle fire, and dulcify with fine sugar.

DISTILLATION OF ORANGE WATER. Take of the yellow part of fresh orange-peel, five pounds; clean proof spirit, $10\frac{1}{2}$ gallons; water, two gallons: draw off ten gallons with a gentle fire.

DISTILLER, he who makes distillations, and commonly a tradesman who makes spirits from malt, &c. By stat. 3 Geo. III. c. 5, s. 12, persons who sell liquors chargeable with duty, and distil spirits, are deemed common distillers, and are liable to surveys, penalties, &c. By the 2 Geo. III. c. 5, and 14 Geo. III. c. 73, no distillers, or those who distil spirits for sale, are allowed to have any still, or number of stills, which, either singly or together, contain less than 100 gallons, under the penalty of 100*l.*; and the wash-still is to hold at least 400 gallons, exclusive of the head, under a similar penalty. By the 8 and 9 William III. c. 19, and 24 Geo. III. c. 40, all distillers are to enter their warehouses, stills,

vessels, &c. at the next office of excise, on pain of 20*l.*; and all such persons as occupy the same, if not entered, shall forfeit 50*l.* and the vessels are to be marked by the gauger. Distillers who use private pipes, &c. for the conveying of distilled liquor, incur a forfeiture of 100*l.* by the 10 and 11 Will. III. c. 4. They are also enjoined by the 12 Geo. III. c. 46, and 14 Geo. III. c. 73, to make holes in the breast of the still, for taking gauges and samples; and also to provide locks on the still heads, the holes, and discharge-cocks, and furnace-doors, under a penalty of 50*l.* and of 200*l.* in case such lock or fastening be broken, or wilfully damaged, after it has been secured by the proper officer. Distillers are farther required, by the 24 Geo. II. c. 40, 12 Geo. III. c. 46, and the 14 Geo. III. c. 73, to give notice to the officer of excise, before they receive any wine, cyder, &c. or any kind of fermented wash, on pain of 50*l.* and also before they charge or open the still, expressing and describing the marks and numbers of the wash-batches used: and they are prohibited from charging the still with any other, under the penalty of 100*l.*

DISTINCT NOTION, or **IDEA**, is that wherein the mind perceives a difference from all other ideas. It will be useful, says Mr. Locke, to distinguish ideas as they are perceptions in our minds, from what they are in the bodies that cause such perceptions in us; for we are not to think the former exact images and resemblances of something inherent in the subject, most of those of sensation being in the mind no more the likeness of something existing without us, than the names that stand for them are the likeness of our ideas, which yet upon hearing they are apt to excite in us.

DISTINCT BASE, in optics, is that distance from the pole of a convex glass, in which objects beheld through it appear distinct and well described, so that it is the same with the focus. See **Focus** and **Optics**.

DISTINCTION, in logic, is an assemblage of two or more words, whereby disparate things, or their conceptions, are denoted. There are three kinds of distinctions taken from the three different modes of existence, real, modal, and rational. The first is that between two substances, or the modes of two substances. The second, or modal distinction, is that between several things, one whereof may exist without the other, but not vice versa, the other without that. The third, or rational distinction, is that between several things which are really one and the same, and whereof one cannot exist without the other; nor vice versa, the other without this: such is that between a thing and its essence, between the essences and properties, &c.

DISTINCTION, **METAPHYSICAL**, is the non-agreement of being, whereby this entity is not that, or one thing is not another.

DISTINCTION, [*distinctio*, or *distinguo*, Lat.] is also used in the schools as an expedient to evade an argument, or to clear up and unfold an ambiguous proposition, which may be true in one sense, and false in another: as we say, The respondent was hard pressed, but he disengaged himself by a *distinguo*.

DISTORSION, in medicine, a contraction of one side of the mouth, occasioned by a convulsion of the muscles of one side of the face: and it is likewise used to denote any part of an animal body, when it is ill placed or ill favoured. It is very justly observed, that this terrible malady to the human shape has often been the mere effect of carelessness and ill habits.

DISTRESS, in law the distraining any thing for rent in arrear, or other duty unperformed. The effect of this distress is to compel the party either to replevy the things distrained, and contest the taking, in an action of trespass against the distrainer; or rather to oblige him to compound and pay the debt or duty for which he was so distrained. There are likewise compulsory distresses in actions, to cause a person to appear in court; of which kind there is a distress personal of one's moveable goods, and the profits of his lands, for contempt in not appearing after summons: there is likewise distress real, of a person's immoveable goods. In these cases none shall be distrained to answer for any thing touching their freeholds, but by the king's writ. Distress may be either finite or infinite:

1. **DISTRESS, FINITE**, is that which is limited by law, in regard to the number of times it shall be made, in order to bring the party to a trial of the action.

2. **DISTRESS, INFINITE**, is that which is without any limitation being made till the person appears. It is farther applied to jurors that do not appear; as, upon a certificate of assise, the process is *venire*

venire facias, habeas corpora, and distress infinite. It is also divided into grand distress and ordinary distress; of these the former extends to all the goods and chattels that the party has within the county. A person, of common right, may distrain for rents and all manner of services; and where a rent is reserved on a gift in tail, lease for life, or years, &c. though there be no clause of distress in the grant or lease, so as that he has the reversion: but on a feoffment made in fee, a distress may not be taken, unless it be expressly reserved in the deed.

DISTRIBUTION OF INTESTATE'S EFFECTS, after payment of the debts of the deceased, is to be made according to the stat. 22 and 23 G. II. c. 10, in manner following: One-third shall go to the widow of the intestate, and the residue in equal proportions to his children; or if dead to their representatives, that is, their lineal descendants: if there are no children or legal representatives, then a moiety shall go to the widow, and a moiety to the next kindred in equal degree, or their representatives; if no widow, the whole shall go to the children; if neither widow nor child, the whole shall be distributed amongst the next kindred in equal degree, and their representatives: but no representatives are admitted among collaterals, farther than the children of the intestate's brothers and sisters. The father succeeds to the whole personal effects of his children, if they die intestate, and without issue; but if the father be dead, and the mother survive, she shall only come in for a share equally with each of the remaining children.

DISTRIBUTION, in architecture, the dividing and disposing of the several parts and pieces which compose a building, as the plan directs. See **ARCHITECTURE**.

DISTRIBUTION, in printing, the taking of a form asunder, separating the types, and disposing them in the cases again, each in its proper cell. See **PRINTING**.

DISTRIBUTION, in rhetoric, a kind of description, whereby an orderly division and enumeration is made of the principal qualities of the subject. Paul supplies us with an example of this kind, when, in the heat of his indignation against sinners, he gives a description of their iniquity. See **Rom. iii. 10—18**.

DISTRINGAS, in law, a writ commanding the sheriff or other officer, that he distrain a person for debt to the king, &c. or for his appearance at a certain day.

DISTRINGAS JURATORES, a writ directed to the sheriff, whereby he is commanded to distrain upon a jury to appear, and to return issues on their lands, &c. &c. for non-appearance. This writ issues for the sheriff to have their bodies in court, &c. at the return of the writ.

DITCH, a common fence in marshes, or other wet lands where there are no hedges. They allow these ditches six feet wide against high ways that are broad: and against commons, five feet. But the common ditches about inclosures, dug at the bottom of the bank on which the quick is raised, are three feet wide at the top, one at the bottom, and two feet deep. By this means each side has a slope, which is of great advantage; for where this is neglected, and the ditches dug perpendicular, the sides are always washing down; besides, in a narrow bottomed ditch, if cattle get down into it, they cannot stand to turn themselves to crop the quick: but where the ditch is four feet wide, it should be two and a half deep; and where it is five feet wide, it should be three deep; and so in proportion.

DITCH, FOSS. See **FORTIFICATION**.

DITHYRAMBIC, 1. A song in honour of Bacchus; in which anciently, and now among the Italians, the distraction of ebriety is imitated. 2. Any poem written with wildness and enthusiasm.

DITHYRAMBUS, in ancient poetry, a hymn in honour of Bacchus, full of transport and poetical rage. This poetry owes its birth to Greece, and to the transports of wine; and yet art is not quite exploded, but delicately applied to guide and restrain the dithyrambic impetuosity, which is indulged only in pleasing flights.

DITONE, in music, an interval comprehending two tones. The proportion of the sounds that form the ditone is 4:5; and that of the semiditone is 5:6.

DITRIGLYH. See **ARCHITECTURE**.

DITTANY, WHITE. See **DICTAMNUS**.

DITTO, in books of accounts, usually written D^o, signifies the aforementioned. The word is corrupted from the Italian *detto*,

"the said;" as in our law-phrase, "the said premises," meaning the same as were before mentioned.

DIVAL, in heraldry, the herb nightshade, used by such as blazon by flowers and herbs, instead of colours and metals, for sable or black.

DIVALIA, in Roman antiquity, a feast held in honour of the goddess Angerona; also called Angeronalia.

DIVAN, a court of justice among the eastern nations, particularly the Turks. The word signifies the same with sofa in the Turkish dialect. There are two sorts of divans; that of the grand signior, called the council of state, which consists of seven of the principal officers of the empire; and that of the grand vizir, composed of six other viziers or counsellors of state, the chancellor and secretaries of state, for the distribution of justice. The word is also used for a hall in the private houses of the orientals. The custom of China does not allow visits in the inner parts of the house, but only at the entry, in a divan contrived on purpose for ceremonies. Travellers relate wonders of the silence and expedition of the divans of the East.

DIVAN BEGHI, the superintendent of justice in Persia, whose place is last of the six ministers of the second rank, who are all under the athemadauler or first minister.

DIVANDUROW, the name of seven islands in the Indian ocean, three miles N. of the Maldives.

DIVER, in ornithology. See **COLYMBUS**.

DIVERGENT, or **DIVERGING**, LINES, in geometry, are those which constantly recede from each other. They are opposed to convergent or converging lines, whose distances continually approach nearer to each other, and become still less and less. Those lines which converge the one way, diverge the other.

DIVERGENT RAYS in optics, are those which going from a point of the visible object, are dispersed and continually depart one from another, in proportion as they are removed from the object: in which sense it is opposed to convergent. See **OPTICS**.

DIVERGING HYPERBOLA, is one whose legs turn their convexities towards one another, and run contrary ways.

DIVERSIFYING, in rhetoric, is an accomplishment essential to the character of an orator, and may be called the subject of all his tropes and figures. Vossius lays down six ways of diversifying a subject. 1. By enlarging on what was briefly mentioned before. 2. By a concise enumeration of what had been insisted on at length. 3. By adding something new to what is repeated. 4. By repeating only the principal heads of what had been said. 5. By transposing the words and periods. 6. By imitating them.

DIVERSION, in military affairs, is, when an enemy is attacked in one place where they are weak and unprovided, in order to draw off their forces from another place, where they have made, or intend to make, an irruption. Thus the Romans had no other way in their power of driving Hannibal out of Italy, but by making a diversion, in attacking Carthage.

DIVESTING, in law, is used for the act of surrendering or relinquishing one's effects. By a contract of donation or sale, the donor or seller is said to be disseised and divested of his property in such a commodity, and the donee or purchaser becomes invested therewith. See **INVESTITURE**.

DIVIDEND, in law proceedings, is taken for a dividing of fees and perquisites between officers of courts, arising from writs, &c.

DIVIDEND, in arithmetic, the number proposed to be divided into equal parts. See **ARITHMETIC**.

DIVIDEND OF STOCKS, is a share of the interest of stocks erected on public funds, as the south-sea, &c. divided among and paid to the adventurers half-yearly. The term is also applied to the annual interest paid by government on the public debts.

DIVIDEND, in the university, signifies that part or share which the fellows equally divide among themselves of their yearly stipend.

DIVINATION, in antiquity, was divided by Plato, Aristotle, Plutarch, Cicero, and others, into two species, viz. artificial and natural.

DIVINATION, ARTIFICIAL, was so called, because it was not obtained, or pretended to be obtained, by immediate inspiration, but proceeded upon certain superstitious experiments and observations.

rations arbitrarily instituted. Of this sort there were various kinds, as by sacrifices, entrails, flame, cakes; flour, wine, water, birds, lots, verses, omens, &c. Divination, which is generally the offspring of credulity, nursed by imposture, and strengthened by superstition, was necessarily an occult science, retained in the hands of the priests and priestesses, the magi, the soothsayers, the augurs, the visionaries, the priests of the oracles, the false prophets, and other like professors, till the time of the coming of Jesus Christ. The light of the gospel dissipated much of this darkness; but it is more difficult, than is commonly conceived, to eradicate from the human mind a deep-rooted superstition, even though the truth be set in the strongest light, especially when the art has been practised almost from the origin of the world: so we still find existing among us the remains of this pagan superstition, in the following chimeras, which enthusiastic and designing men have formed into arts and sciences; though it must be owned, to the honour of the 18th century, that the pure doctrines of Christianity, and the spirit of philosophy, which becomes every day more diffused, concur in banishing these visionary opinions. The vogue for these impious sciences and arts, is nearly past, at least in the enlightened parts of the world, though most of them are still esteemed and practised in those parts of the globe which are enveloped in the clouds and darkness of ignorance and superstition. By enumerating them here, therefore, we only mean to shew their impiety, and to mark those rocks upon which the human mind has foundered in almost all ages and countries. 1. Aeromancy, the art of divining by the air. 2. Astrology; divided into natural astrology and judicial. The former is a branch of the art of almanack-makers; but by merely confronting their predictions in the calendar, with the weather each day produces, every man of sense will see what regard is to be paid to our modern astrologers. The latter is still more illusive; and having been at first the wonderful art of visionaries, it afterwards became that of impostors; a very common fate with all these chimerical sciences. 3. Augury consisted in observing the flight, singing, &c. of birds. 4. Chiromancy, the art which pretends to discover, by inspecting the hand, not only the inclinations of a man, but his future destiny also. The fools or knaves, who practise this art, pretend, that the lines of the hand have a relation to the internal parts of the body, as some to the heart, others to the liver, spleen, &c. On this false supposition, and on many others equally extravagant, the principles of chiromancy are founded. 5. Geomancy was a divination made by observing cracks or clefts in the earth. It was also performed by points made on paper, or any other substance, at a venture; and they judged of future events from the figures that resulted from thence. This was certainly very ridiculous: but it is nothing less so to pretend to predict future events by the inspection of the grounds of a dish of tea or coffee, or by cards, and many other like matters. 6. Haruspicy consisted in the inspection of the bowels of animals, but principally of victims; and from thence predicting grand incidents relative to the republic, and the good or bad events of its enterprises. 7. Horoscopy is a branch of astrology, by which they draw a celestial scheme, containing the twelve houses, wherein they mark the disposition of the heavens at the moment, at which a man is born, in order to foretel his fortune, or the chief incidents of his life. But as there cannot be any probable or possible relation between the constellations and the human race, all the principles they lay down, and the prophecies they draw from them, are chimerical, false, absurd, and a criminal imposition on mankind. 8. Hydromancy is the art of divining by water. The Persians, according to Varro, invented it; Pythagoras and Numa Pompilius made use of it; and some still admire the like wonderful prognosticators. 9. Physiognomy, or Physiognomancy, is a science that professes to teach the nature, the temperament, the understanding, and the inclinations of men, by the inspection of their countenances, and is therefore thought by many, to be little less frivolous than chiromancy; though Aristotle, and a number of learned men after him, and in the present age, the celebrated Lavater, have written express treatises concerning it. But as it is an undeniable fact, that our passions, especially when frequently and violently agitated, make indelible impressions on our features, by their repeated action on particular muscles, insomuch that the tempers of many people may be known at first view from their looks; and as it is not improbable, that certain habits of vice make impressions equally uniform, and perhaps equally legible, if we were accustomed to study them, physiognomy appears to be

worthy of being rescued from the rubbish of superstition and of imposture; of being restored to its place among the useful sciences; and cultivated and reduced to fixed principles by those who have leisure for such investigations. See *PHYSIOGNOMY*. 10. Pyromancy is a divination made by the inspection of a flame, either by observing to which side it turns, or by throwing into it some combustible matter, or a bladder filled with wine, or any thing else from which they imagined they were able to predict. Thus designing men made use of all the four elements to impose upon the credulous.

DIVINATION, NATURAL, was so called, because not attained by any rules or precepts of art, but infused or inspired into the diviner, without his taking any further care about it, than to purify and prepare himself for the reception of the divine aflatus.

DIVING, the art or act of descending under water to considerable depths, and remaining there for some time. The uses of diving are very considerable, particularly in the fishing for pearls, corals, sponges, &c. See *PEARL-FISHING*, &c. Various methods have been proposed, and machines contrived, to render the business of diving more safe and easy. The great point is to furnish the diver with fresh air; without which, he must either make a short stay or perish. Those who dive for sponges in the Mediterranean, help themselves by carrying down sponges dipt in oil in their mouths. But considering the small quantity of air that can be contained in the pores of a sponge, and how much that little will be contracted by the pressure of the incumbent water, such a supply cannot long subsist the diver. For it is found by experiment, that a gallon of air included in a bladder, and by a pipe reciprocally inspired and expired by the lungs, becomes unfit for respiration in little more than one minute. For though its elasticity be but little altered in passing the lungs, yet it loses its vivifying spirit, and is rendered effete. A naked diver, Dr. Halley assures us, without a sponge, cannot remain above a couple of minutes inclosed in water, nor much longer with one, without suffocating; nor, without long practice, near so long; persons not accustomed to dive, beginning to stifle in about half a minute. Besides, if the depth be considerable, the pressure of the water in the vessels makes the eyes blood-shot, and frequently occasions a spitting of blood. Hence, where there has been occasion to continue long at the bottom, some have contrived double flexible pipes, to circulate air down into a cavity, inclosing the diver as with armour, both to furnish air and to bear off the pressure of the water, and give leave to his breast to dilate upon inspiration; the fresh air being forced down one of the pipes with bellows, and returning by the other. But this method is impracticable when the depth surpasses three fathoms; the water embracing the bare limbs so closely as to obstruct the circulation of the blood in them; and withal pressing so strongly on all the junctures where the armour is made tight with leather, that, if there be the least defect in any of them, the water rushes in, and instantly fills the whole engine, to the great danger of the diver's life.

DIVING-BELL, a machine contrived for the safe conveyance of a diver to any reasonable depth, and whereby he may stay a considerable time under water. It is most conveniently made in form of a truncated cone, the smaller base being closed, and the larger open. It is to be poised with lead: and so suspended, that the vessel may sink full of air, with its open basis downward, and as near as may be in a situation parallel to the horizon, so as to close with the surface of the water all at once. Under this coverlet the diver sitting, sinks down with the included air to the depth desired: and if the cavity of the vessel can contain a tun of air, a single man may remain a full hour, without much inconvenience, at five or six fathoms deep. But the lower he goes, the more the included air contracts itself, according to the weight of the water which compresses it: so that at 33 feet deep the bell becomes half full of water, the pressure of the incumbent water being then equal to that of the atmosphere; and at all other depths the space occupied by the compressed air in the upper part of the bell will be to the under part of its capacity filled with water, as 33 feet to the surface of the water in the bell below the common surface thereof. And this condensed air being taken in with the breath soon insinuates itself into all the cavities of the body, and has no ill effect, provided the bell be permitted to descend so slowly as to allow time for that purpose. One inconvenience that attends it is found in the ears, within which there are cavities which open only outwards, and that by pores so small as not to give admission even to the air itself,

unless they be dilated and distended by a considerable force. Hence, on the first descent of the bell, a pressure begins to be felt on the ear; which, by degrees, grows painful, till the force overcoming the obstacle, what constricts these pores yields to the pressure, and letting some condensed air slip in, presently ease ensues. The bell descending lower, the pain is renewed, and again eased in the same manner. But the greatest inconvenience of this engine is, that the water entering it, contracts the bulk of air into so small a compass, that it soon heats and becomes unfit for respiration, so that there is a necessity for its being drawn up to recruit it; besides the uncomfortable situation of the diver almost covered with water. To obviate these difficulties, Dr. Halley contrived some further apparatus, whereby not only to recruit and refresh the air from time to time, but also to keep the water wholly out of it at any depth. The bell he made use of was of wood, containing about 60 cubic feet in its concavity; and was of the form of a truncated cone, whose diameter at the top was three feet, and at the bottom five. This he coated with lead so heavy that it would sink empty; and he distributed the weight so about its bottom, that it would go down in a perpendicular direction, and no other. In the top was fixed a strong clear glass, as a window, to let in the light from above; and likewise a cock to let out the hot air that had been breathed: and below, about a yard under the bell, was placed a stage which hung by three ropes, each of which was charged with about 100 weight to keep it steady. This machine he suspended from the mast of a ship by a sprit, which was sufficiently secured by stays to the mast head, and was directed by braces to carry it overboard clear of the ship's side, and to bring it again within board as occasion required. To supply air when under water he caused a couple of barrels of about 36 gallons each to be cased with lead, so as to sink empty; each of them having a bung-hole in its lowest part to let in the water, as the air in them condensed on their descent; and to let it out again when they were drawn up full from below. To a hole in the uppermost part of these barrels, was fixed a leathern trunk or hose well liquored with bees wax and oil, and long enough to fall below the bung-hole, being kept down by a weight appended: so that the air in the upper part of the barrels could not escape, unless the lower ends of these hose were first lifted up. The air-barrels being thus prepared, he fitted them with tackle proper to make them rise and fall alternately, after the manner of two buckets in a well; which was done with so much ease, that two men, with less than half their strength, could perform all the labour required: and in their descent they were directed by lines fastened to the under edge of the bell, which passed through rings on both sides the leathern hose in each barrel; so that, sliding down by these lines, they came readily to the hand of a man who stood on the stage on purpose to receive them, and to take up the ends of the hose into the bell. Through these hose, as soon as their ends came above the surface of the water in the barrels, all the air that was included in the upper parts of them was blown with great force into the bell; whilst the water entered at the bung-holes below, and filled them: and as soon as the air of one barrel had been thus received, upon a signal given, that was drawn up, and at the sametime the other descended; and, by an alternate succession, furnished air so quick, and in so great plenty, that he and four others were together at the bottom in nine or ten fathom water, for above an hour and an half at a time, without any ill consequence: and might have continued there as long as they pleased, for any thing that appeared to the contrary. In descending they found it necessary to be let down gradually at first, as about 12 feet at a time; and then to stop and drive out the air that entered, by receiving three or four barrels of fresh air. But being arrived at the depth designed, as much of the hot air that had been breathed, as each barrel would replenish with cool, was let out by means of the cock at the top of the bell; through whose aperture, though very small, the air would rush with so much violence, as to make the surface of the sea boil, and to cover it with a white foam, notwithstanding the weight of the water above. And thus by the introduction of air a space at the bottom of the sea as wide as the circuit of the bell, could be made so far dry, as not to be overshoes thereon. And, by the glass window, so much light was transmitted, that when the sea was clear, and especially when the sun shone, they could see perfectly well to write or read; much more to fasten or lay hold on any thing that was to be taken up. By an additional contrivance, he found it not impracticable for a diver to go out of an engine to a

good distance from it, the air being conveyed to him with a continued stream, by small flexible pipes; which pipes may serve as a clue, to direct him back again when he would return to the bell. Plate LIX. fig. 1, shews Dr. Halley's diving-bell, with the divers at work. DBLK RIMP represents the body of the bell. D, the glass which serves as a window. B, the cock for letting out the air which has been breathed. LM, the seats. C, one of the air-barrels. P, H, two of the divers. F, another diver at a distance from the bell, and breathing through the flexible tube K. This diver is supposed to have a head-piece of lead, made to fit quite close about his shoulders: this head-piece was capable of containing as much air as would supply him for a minute or two. When he had occasion for more air, he turned a cock at F, by which means a communication was opened with the air in the bell, and thus he could receive a new supply at pleasure.

DIVING-BELL, MR. TRIEWALD'S. Mr. Triewald, F. R. S. and military architect to the late king of Sweden, has invented a diving-bell, (fig. 2,) which, for a single person, is thought to be more eligible than Dr. Halley's, and is constructed as follows: AB is the bell, which is sunk by lead weights DD hung to its bottom. This bell is of copper, tinned all over in the inside, which is illuminated by three strong convex lenses, G, G, G, with copper lids H, H, H, to defend them. The iron plate E, serves the diver to stand on when he is at work; and is suspended at such a distance from the bottom of the bell by the chains F, F, F, that when the diver stands upright, his head is just above the water in the bell, where the air is much better than higher up, because it is colder, and consequently more fit for respiration. But as the diver must always be within the bell, and his head of course in the upper part, the inventor has contrived, that even there, when he has breathed the hot air as long as he can, he may, by means of a spiral copper tube *bc*, placed close to the inside of the bell, draw the cooler and fresher air from the lowermost parts: for which purpose, a flexible leather tube, about two feet long, is fixed to the upper end of the copper tube at *b*; and to the other end of this tube is fixed an ivory mouth-piece, by which the diver draws in the air.

DIVING-BELL, SPALDING'S IMPROVED. The greatest improvement, which the diving-bell ever received, was from the late Mr. Spalding of Edinburgh. A section of his improved diving-bell is represented in fig. 3. This construction is designed to remedy some inconveniences of Dr. Halley's, which are very evident, and of very dangerous tendency. These are, 1. By Dr. Halley's construction, the sinking or raising of the bell depends entirely on the people who are at the surface of the water; and as the bell even when in the water has a very considerable weight, the raising it not only requires a great deal of labour, but there is a possibility of the rope breaking by which it is raised, and thus every person in the bell would inevitably perish. 2. As there are, in many places of the sea, rocks which lie at a considerable depth, the figure of which cannot possibly be perceived from above, there is danger that some of their ragged prominences may catch hold of one of the edges of the bell in its descent, and thus overset it before any signal can be given to those above, which would infallibly be attended with the destruction of the people in the bell: and as it must always be unknown, before trial, what kind of a bottom the sea has in any place, it is plain, that without some contrivance to obviate this last danger, the descent in Dr. Halley's diving-bell is not at all eligible. How these inconveniences are remedied by Mr. Spalding's new construction will be easily understood from the following description.—ABCD represents a section of the bell, which is made of wood; *e, e*, are iron hooks, by means of which it is suspended by ropes QBF *e*, and QAER *e*, and QS, as expressed in the figure: *c, c*, are iron hooks, to which are appended lead weights, that keep the mouth of the bell always parallel to the surface of the water, whether the machine taken altogether is lighter or heavier than an equal bulk of water. By these weights alone, however, the bell would not sink: another is therefore added, represented at L; and which can be raised or lowered at pleasure, by means of a rope passing over the pulley *a*, and fastened to one of the sides of the bell at M. As the bell descends, this weight, called by Mr. Spalding the balance-weight, hangs down a considerable way below the mouth of the bell. In case the edge of the bell is caught by any obstacle, the balance-weight is immediately lowered down so that it may rest upon the bottom. By this means the bell is lightened so that all danger of

oversetting is removed; for being lighter, without the balance-weight, than an equal bulk of water, it is evident that the bell will rise, as far as the length of the rope affixed to the balance-weight will allow it. This weight, therefore, will serve as a kind of anchor to keep the bell at any particular depth which the divers may think necessary; or by pulling it quite up, the descent may be continued to the very bottom. By another very ingenious contrivance, Mr. Spalding rendered it possible for the divers to raise the bell, with all the weights appended to it, even to the surface, or to stop at any particular depth, as they think proper; and thus they could still be safe, even though the rope designed for pulling up the bell was broke. For this purpose the bell is divided into two cavities, each of which is made as tight as possible. Just above the second bottom EF, are small slits in the sides of the bell; through which the water, entering as the bell descends, displaces the air originally contained in this cavity, which flies out at the upper orifice of the cock GH. When this is done, the divers turn the handle G, which stops the cock; so that if any more air was to get into the cavity AEFB, it could not longer be discharged through the orifice H as before. When this cavity is full of water, the bell sinks; but when a considerable quantity of air is admitted, it rises. If therefore the divers have a mind to raise themselves, they turn the small cock g, by which a communication is made between the upper and under cavities of the bell. The consequence of this is, that a quantity of air immediately enters the upper cavity, forces out a quantity of the water contained in it, and thus renders the bell lighter by the whole weight of the water which is displaced. Thus, if a certain quantity of air is admitted into the upper cavity, the bell will descend very slowly; if a greater quantity, it will neither ascend nor descend, but remain stationary; and if a larger quantity of air is still admitted, it will arise to the top. It is to be observed, however, that the air which is thus let out into the upper cavity must be immediately supplied from the air-barrel; from which the air is to be let out very slowly, or the bell will rise to the top with so great velocity, that the divers will be in danger of being shaken out of their seats. But, by following these directions, every possible accident may be prevented, and people may descend to great depths without the least apprehension of danger. The bell also becomes so easily manageable in the water, that it may be conducted from one place to another by a small boat with the greatest ease, and with perfect safety to those who are in it. Instead of wooden seats used by Dr. Halley, Mr. Spalding made use of ropes suspended by hooks *b b b*, and on these ropes the divers may sit without any inconvenience. I and K are two windows made of thick strong glass, for admitting light to the divers. N represents an air-cask with its tackle, and OCP the flexible pipe through which the air is admitted to the bell. In the ascent and descent of this cask, the pipe is kept down by a small weight appended, as in Dr. Halley's machine. R is a small cock by which the hot air is discharged as often as it becomes troublesome. Fig. 4, gives a perspective view of the whole diving apparatus. Two air-barrels are represented in this figure; but Mr. Spalding was of opinion, that one capable of containing thirty gallons is sufficient for an ordinary machine.

DIVING BLADDER, a machine invented by Borelli, and by him preferred, though without any good reason, to the diving-bell. It is a globular vessel of brass or copper, about two feet in diameter, which contains the diver's head. It is fixed to a goat's skin habit exactly fitted to his person. Within the vessel are pipes; by means of which a circulation of air is contrived; and the person carries an air-pump by his side, by which he can make himself heavier or lighter as fishes do, by contracting or dilating their air-bladder. By these means he thought all the objections to which other diving machines are liable were entirely obviated, and particularly that of want of air; the air which had been breathed, being as he imagined, deprived of its noxious qualities by circulating through the pipes. These advantages, however, it is evident, are only imaginary. The diver's limbs, being defended from the pressure of the water only by a goat's skin, would infallibly be crushed if he descended to any considerable depth; and from the discoveries now made by Dr. Priestley and others, it is abundantly evident, that air, which is once rendered foul by breathing, cannot in any degree be restored by circulation through pipes. Concerning the use of copper machines in general, Mr. Spalding has remarked, that when a person has breathed in them

a few minutes, he feels in his mouth a very disagreeable brassy taste, which continues all the time he remains in the vessel; so that, on this account, copper seems by no means an eligible material.

DIVING CASE, a large case of strong leather, perfectly waterproof, which may hold about half a hoghead of air; invented by a gentleman of Devonshire. It is so contrived, that, when he shuts himself up in this case, he can walk at the bottom of the sea, and go into any part of a wrecked vessel, and deliver out the goods. This method, we are told, he has practised for many years, and has thus acquired a large fortune. It would be a considerable improvement on this machine to condense the air in it as much as possible before the diver descended; as he would thus be furnished with an atmosphere endued with elasticity sufficient to resist the weight of the water, which otherwise would squeeze his case into much less room than it originally took up. The condensed air also would serve for respiration a much longer time than that which is in its ordinary state. A curious diving-machine called a submarine vessel, was invented by Mr. Bushnell of Connecticut; and of which a description is given in the Transactions of the American Philosophical Society. The external shape of the submarine vessel bore some resemblance to two upper tortoise-shells, of equal size, joined together; the place of entrance into the vessel being represented by the opening made by the swell of the shells, at the head of the animal. The inside was capable of containing the operator, and air sufficient to support him thirty minutes without receiving fresh air. At the bottom, opposite to the entrance, was fixed a quantity of lead for ballast. At one edge, which was directly before the operator, who sat upright, was an oar for rowing forward or backward. At the other edge was a rudder for steering. An aperture, at the bottom, with its valve, was designed to admit water, for the purpose of descending; and two brass forcing-pumps served to eject the water within, when necessary for ascending. At the top there was likewise an oar for ascending or descending, or continuing at any particular depth. A water-gauge, or barometer, determined the depth of descent, a compass directed the course, and a ventilator within supplied the vessel with fresh air, when on the surface. The entrance into the vessel was elliptical, and so small as barely to admit a person. This entrance was surrounded with a broad elliptical iron band, the lower edge of which was let into the wood of which the body of the vessel was made, in such a manner as to give its utmost support to the body of the vessel against the pressure of the water. Above the upper edge of this iron band there was a brass crown, or cover, resembling a hat with its crown and brim, which shut water-tight upon the iron band: the crown was hung to the iron band with hinges, so as to turn over sideways when opened. To make it perfectly secure when shut, it might be screwed down upon the band by the operator, or by a person without. There were in the brass crown three round doors, one directly in front, and one on each side, large enough to put the hand through. When open they admitted fresh air; their shutters were ground perfectly tight into their places with emery, hung with hinges, and secured in their places when shut. There were likewise several small glass windows in the crown for looking through, and for admitting light in the day-time, with covers to secure them. There were two air-pipes in the crown. A ventilator within drew fresh air through one of the air-pipes, and discharged it into the lower part of the vessel; the fresh air introduced by the ventilator expelled the impure light air through the other air-pipe. Both air-pipes were so constructed, that they shut themselves whenever the water rose near their tops, so that no water could enter through them, and opened themselves immediately after they rose above the water. The vessel was chiefly filled with lead fixed to its bottom; when this was sufficient, a quantity was placed within, more or less, according to the weight of the operator; its ballast made it so stiff, that there was no danger of oversetting. The vessel with all its appendages, and the operator, was sufficient to settle it very low in the water. About two hundred pounds of the lead, at the bottom for ballast, would be let down forty or fifty feet below the vessel; this enabled the operator to rise instantly to the surface of the water, in case of accident. When the operator would descend, he placed his foot on the top of a brass valve, depressing it, by which he opened a large aperture in the bottom of the vessel, through which the water entered at his pleasure; when he had admitted a sufficient quantity, he ascended very gradually:

dually: if he admitted too much, he ejected as much as was necessary to obtain an equilibrium by the two brass forcing-pumps placed at each hand. Whenever the vessel leaked, or he would ascend to the surface, he also made use of the forcing-pumps. When the skilful operator had obtained an equilibrium, he could row upward or downward, or continue at any particular depth, with an oar placed near the top of the vessel, formed upon the principle of the screw, the axis of the oar entering the vessel; by turning the oar one way he raised the vessel, by turning it the other way he depressed it. A glass tube eighteen inches long, and one inch in diameter, standing upright, its upper end closed, and its lower end which was open, screwed into a brass pipe, through which the external water had a passage into the glass tube, served as a water-gauge or barometer. There was a piece of cork, with phosphorus on it, put into the water-gauge. When the vessel descended the water rose in the water-gauge, condensing the air within, and bearing the cork, with its phosphorus, on its surface. By the light of the phosphorus the ascent of the water in the gauge was rendered visible, and the depth of the vessel under water ascertained by a graduated line. An oar, formed upon the principle of the screw, was fixed in the fore-part of the vessel; its axis entered the vessel, and being turned one way, rowed the vessel forward, but being turned the other way rowed it backward; it was made to be turned by the hand or foot. A rudder, hung to the hinder part of the vessel, commanded it with the greatest ease. The rudder was made very elastic, and might be used for rowing forward. Its tiller was within the vessel, at the operator's right-hand, fixed at a right angle, on an iron rod which passed through the side of the vessel; the rod had a crank on its outside end, which commanded the rudder, by means of a rod extending from the end of the crank to a kind of tiller, fixed upon the left hand of the rudder. Raising and depressing the first-mentioned tiller, turned the rudder as the case required. A compass marked with phosphorus directed the course, above and under the water: and a line and lead sounded the depth when necessary. Every opening was well secured. The pumps had two sets of valves. The aperture at the bottom, for admitting water, was covered with a plate, perforated full of holes to receive the water, and prevent any thing from choking the passage, or stopping the valve from shutting. The brass valve might likewise be forced into its place with a screw, if necessary. The air-pipes had a kind of hollow sphere, fixed round the top of each, to secure the air-pipe valves from injury: these hollow spheres were perforated full of holes for the passage of the air through the pipes: within the air-pipes were shutters to secure them, should any accident happen to the pipes or the valves on their tops. Wherever the external apparatus passed through the body of the vessel, the joints were round, and formed by brass pipes, which were driven into the wood of the vessel; the holes through the pipes were exactly made, and the iron rods, which passed through them, were turned into a lathe to fit them; the joints were also kept full of oil, to prevent rust and leaking. Particular attention was given to bring every part, necessary for performing the operations, both within and without the vessel, before the operator, and as conveniently as could be devised; so that every thing might be found in the dark, except the water-gauge and the compass, which were visible by the light of the phosphorus; and nothing required the operator to turn to the right hand, or to the left, to perform any thing necessary. The design of this submarine vessel was to convey a magazine, and its appendages, to the bottom of a ship to effect its destruction. In the fore-part of the brim of the crown of the submarine vessel were a socket, and an iron tube passing through the socket: the iron tube stood upright and could slide up and down in the socket six inches: at the top of the tube was a wood screw, fixed by means of a rod, which passed through the tube, and screwed the wood-screw fast upon the top of the tube: by pushing the wood-screw up against the bottom of a ship, and turning it at the same time, it would enter the planks; driving would also answer the same purpose: when the wood-screw was firmly fixed it could be cast off by unscrewing the rod, which fastened it upon the top of the tube. Behind the submarine vessel was a place, above the rudder, for carrying a large powder-magazine; this was made of two pieces of oak timber, large enough, when hollowed out, to contain 150 pounds of powder, with the apparatus used in firing it, and was secured in its place by a screw, turned by the operator. A strong piece

of rope extended from the magazine to the wood-screw above-mentioned, and was fastened to both. When the wood-screw was fixed, and to be cast off from its tube, the magazine was to be cast off likewise by unscrewing it, leaving it hanging to the wood-screw; it was lighter than the water, that it might rise up against the object to which the wood-screw and itself were fastened. Within the magazine was an apparatus, constructed to run any proposed length of time: it unpinioned a strong lock resembling a gun-lock, which gave fire to the powder. This apparatus was so pinioned that it could not possibly move till, by casting off the magazine from the vessel, it was set in motion. The skilful operator could swim so low on the surface of the water as to approach very near a ship in the night, without fear of being discovered; and might, if he chose, approach the stem or stern above water with very little danger. He could sink very quickly, and keep at any depth he pleased, and row a great distance in any direction he desired, without coming to the surface; and when he rose to the surface, he could soon obtain a fresh supply of air, when, if necessary, he might descend again, and pursue his course. The following experiments were made to prove the use of this vessel. The first experiment was made with about two ounces of gun-powder, which were exploded four feet under water, to prove to some of the first personages in Connecticut, that powder would take fire under water. The second experiment was made with two pounds of powder, inclosed in a wooden bottle, and fixed under a hoghead, with a two-inch oak plank between the hoghead and the powder; the hoghead was loaded with stones as deep as it could swim; a wooden pipe descending through the lower head of the hoghead, and through the plank, into the powder contained in the bottle, was primed with powder. A match put to the priming, exploded the powder; which produced a very great effect, rending the plank into pieces, demolishing the hoghead, and casting the stones and the ruins of the hoghead, with a body of water, many feet into the air, to the astonishment of the spectators. There were afterwards made many experiments of a similar nature, some of them with large quantities of powder; they all produced very violent explosions, much more than sufficient for the purpose proposed. After various attempts to find an operator to his wish, Mr. Bushnell sent one, who appeared more expert than the rest, from New York to a fifty-gun ship, lying not far from Governor's Island. He went under the ship, and attempted to fix the wood-screw into her bottom; but struck, as he supposes, a bar of iron, which passes from the rudder-hinge, and is spiked under the ship's quarter. Had he moved a few inches, which he might have done without rowing, he would probably have found wood where he might have fixed the screw; or, if the ship were sheathed with copper, he might easily have pierced it; but not being well skilled in the management of the vessel, in attempting to move to another place, he lost the ship; after seeking her in vain, for some time, he rowed some distance, and rose to the surface of the water, but found day-light had advanced so far, that he durst not renew the attempt. The adventurer said that he could easily have fastened the magazine under the stem of the ship, above water, as he rowed up to the stern, and touched it before he descended. Had he fastened it there, the explosion of 150 pounds of powder (the quantity contained in the magazine), must have been fatal to the ship. In his return from the ship to New York he passed near Governor's Island, and thought he was discovered by the enemy on the island; being in haste to avoid the danger he feared, he cast off the magazine, as he imagined it retarded him in the swell, which was very considerable. After the magazine had been cast off one hour, the time the internal apparatus was set to run, it blew up with great violence. Several other machines have been constructed for the purpose of diving; all of them depending on the same principles.

DIVINITY. See THEOLOGY.

DIVIO, DIBIO, or DIVIONENSE CASTRUM, in ancient geography, a town of the Lingones, in Gallia Belgica, now called Dijon.

DIVISIBILITY, in physics, is that property by which the particles of matter in all bodies are capable of a separation or disunion from each other. The Peripatetics and Cartesians hold divisibility to be an affection of all matter. The Epicureans, again, allow it to agree to every physical continuum; but they deny that this affection agrees to all bodies, for the primary corpuscles or atoms they maintain to be perfectly insecable and indivisible.

visible. Absolutely to determine whether the divisibility of matter may proceed without limits, or that there are ultimate primary corpuscles not admitting of further division, does not appear as yet to be within the reach of philosophy. That all bodies contain an infinity of parts is exceedingly obvious, thus any body which can be proposed has for instance ten parts, each of the ten parts has also ten parts, and again each of these has ten parts, and so on without limit. The same would appear by supposing any other number of parts as well as ten, and it would be absurd to suppose that the smallest particle has fewer halves, quarters, tenths parts, &c. than the largest mountain. That any given extension is divisible ad infinitum in a mathematical point of view may be thus demonstrated. See Plate LIV. fig. 13. Suppose the line AC perpendicular to BF; and another, as GH, at a small distance from it, also perpendicular to the same line. With the centres CCC, &c. describe circles cutting the line GH in the points e e e, &c. Now the greater the radius AC is, the less is the part eG. But the radius may be augmented in infinitum; so long, therefore, the part eG may be divided into still less portions; consequently it may be divided in infinitum. Or thus, suppose the line AB, (fig. 12,) be required to be divided, through its extreme points A and B draw EF and CD parallel to each other; in one of these lines take a point as L, and from L draw lines LD to the line CD, cutting AB in e: it is evident that the further D is taken from B, the part Ae will be the less, and since BD may be continued without limits, the part Ae may be lessened without limits, or it is divisible ad infinitum. Thus far we have shewn that extension, and consequently that an extended body, contains an unlimited number of parts; but with respect to the limits of the divisibility of matter itself, we are perfectly in the dark. We can indeed divide certain bodies into surprisingly fine and numerous particles, and the works of nature offer many fluids and solids of wonderful tenuity; but both our efforts, and those naturally small objects, advance a very short way towards infinity. Ignorant of the intimate nature of matter, we cannot assert whether it may be capable of infinite division, or whether it ultimately consists of particles of a certain size, and of perfect hardness. However, the uniformity and constancy of the qualities of the same bodies would lead us to conclude that there are ultimate invariable, indivisible particles which are their true constituents, and which do not admit of a separation of their parts by any power less than that of Him who formed them. But even these are amazingly small, as will appear from the following instances of the wonderful tenuity of certain bodies, which have been produced either by art, or discovered by means of microscopical observations amongst the stupendous works of nature. The spinning of wool, silk, cotton, and such-like substances, afford no bad specimens; since the thread which has been produced by this means, has often been so very fine as almost to exceed the bounds of credibility, had it not been sufficiently well authenticated. Mr. Boyle mentions that two grains and a half of silk was spun into a thread 300 yards long. A few years ago, a lady of Lincolnshire spun a single pound of woollen yarn into a thread of 168,000 yards long, which is equal to 95 English miles. Also a single pound weight of fine cotton-yarn was lately spun, in the neighbourhood of Manchester, into a thread 134,400 yards long. The ductility of gold likewise furnishes a striking example of the great tenuity of matter amongst the productions of human ingenuity. A single grain weight of gold has been often extended into a surface equal to 50 square inches. If every square inch of it is divided into square particles of the hundredth part of an inch, which will be plainly visible to the naked eye, the number of those particles in one inch square, will be 10,000; and multiplying this number by the 50 inches, the product is 500,000; that is, the grain of gold may be actually divided into at least half a million of particles, each of which is perfectly apparent to the naked eye. Yet, if those particles are viewed in a good microscope, they will appear like a large surface, the ten thousandth part of which might by this means be easily discerned. An ingenious artist in London has been able to draw parallel lines upon a glass plate, as also upon silver, so near one another, that 10,000 of them occupy the space of one inch. Those lines can be seen only by the assistance of a very good microscope. Another workman has drawn a silver wire, the diameter of which does not exceed the 750th part of an inch. But those prodigies of human ingenuity will appear extremely gross and rude, if they are com-

pared with the immense subtilty of matter which may every where be observed amongst the works of nature. The animal, the vegetable, and even the mineral kingdom, furnish numerous examples of this sort. What must be the tenuity of the odoriferous parts of musk, when we find that a piece of it will scent a whole room in a short time, and yet it will hardly lose any sensible part of its weight! But supposing it to have lost one-hundredth part of a grain weight, when this small quantity is divided and dispersed through the whole room, it must so expand itself as not to leave an inch square of space where the sense of smell may not be affected by some of its particles! The human eye, unassisted by glasses, can frequently perceive insects so small as to be barely discernible. The least reflection must shew, that the limbs, the vessels, and other parts of such animals, must infinitely exceed in fineness every endeavour of human art. But the microscope has discovered wonders that are vastly superior, and such indeed as were utterly unknown to our fore-fathers, before the invention of that noble instrument. Insects have been discovered so small as not to exceed the 10,000th part of an inch: so that 1,000,000,000,000, of them might be contained within the space of one cubic inch; yet each animalcule must consist of parts connected with each other; with vessels, with fluids, and with organs necessary for its motions, for its increase, for its propagation, &c. How inconceivably small must those organs be! and yet they are unquestionably composed of other parts still smaller, and still farther removed from the perception of our senses.

DIVISION, among logicians, is the explication of a complex idea, by enumerating the simple ideas whereof it is composed; in which sense it is nearly allied to definition, only that this last regards names and things, whereas division is employed wholly about ideas. When the parts of an idea are divided, in order to a clearer explication of the whole, this is called a subdivision: thus, a year is divided into twelve months, a month is subdivided into weeks, weeks into days, days into hours, and so on. The rules for a good division are these, that the members entirely exhaust the whole; that they be opposite; that subdivisions be not too numerous; that the whole be first divided into its larger parts, and these into the more remote and minute parts.

DIVISION, in mathematics. See ALGEBRA and ARITHMETIC.

DIVISION, in sea affairs, a select number of ships in a fleet or squadron of men of war, distinguished by a particular flag or pendant, and usually commanded by a general officer. A squadron is commonly ranged into three divisions, the commanding officer of which is always stationed in the centre. When a fleet consists of 60 sail of the line, that is, of ships having at least 60 cannon each, the admiral divides it into three squadrons, each of which has its divisions and commanding officers. Each squadron has its proper colours, according to the rank of the admiral, and every division its proper mast. Thus in Britain, the first admiral, or the admiral of the fleet, displays the union flag at the main-top-mast head; next follows the white flag with St. George's cross; and afterwards the blue. The private ships carry pendants of the same colour with their respective squadrons at the mast of their particular divisions; so that the last ship in the division of the blue squadron carries a blue pendant at her mizen-top-mast head.

DIVISION, MECHANICAL, signifies that separation which is occasioned in the parts of a body by help of mechanical instruments. The mechanical division of bodies does indeed separate them into smaller, homogeneous, similar parts; but this separation cannot extend to the primary integrant molecules of any body; and consequently is incapable of breaking what is properly called their aggregation. No union is formed betwixt the dividend and dividing bodies, in which respect division essentially differs from dissolution. Division is not properly a chemical operation. It is only employed preparatorily to facilitate other operations, and particularly solution. For this purpose it is very useful, as it increases the quantity of surface, and consequently the points of contact of any body. Different methods are used to divide bodies according to their nature, as that of cutting, rasping, filing, pounding, bruising, grinding, &c.

DIVISION, in music, the dividing of the interval of an octave into a number of less intervals. The fourth and fifth divide the octave perfectly, though differently: when the fifth is below, and serves as a bass to the fourth, the division is called harmonical;

but when the fourth is below, it is called arithmetical. To run a division, is to play, or sing, after the manner above-mentioned; that is, to divide the intervals of an octave, fifth, fourth, &c. into as many parts, and as agreeably as possible, which depends entirely upon taste and fancy.

DIVISION, in rhetoric, the arrangement of a discourse under several heads, each of which is to be separately spoken to.

DIVISIONS OF PROPORTION. If four quantities be proportional, as $a : b :: c : d$; then the assumption of the difference between the antecedents $a - b$, or $b - a$, to either the antecedent a , or consequent b , of the first ratio a to b ; and the difference between the antecedent $c - d$ or $d - c$ to either the antecedent c , or consequent d of the second ratio c to d ; is called division of proportion.

DIVISION OF AN ARMY, in the military art, the several brigades and squadrons into which it is cantoned.

DIVISIONS OF A BATTALION are the several platoons into which it is divided in marching or firing, each of which is commanded by an officer.

DIVISOR, [*divisor*, Lat.] the number which sheweth how many parts the dividend is to be divided into. See **ARITHMETIC**.

DIUM, in ancient geography, the name of several places: viz. 1. A town of Chalcidice in Macedonia, near Mount Athos: 2. A promontory of Crete, on the north side of the island: 3. A promontory of Eubœa; or a town of that name in Eubœa, near the promontory Cœnæum, on the N. W. side of the island, called also Dia: 4. A town of Macedonia, in Persia, on the W. side of the Sinus Thermaicus: 5. A town near Pella in the Piræa, beyond Jordan.

DIVORCE, [*divorce*, Fr. from *divortium*, Lat.] the legal separation of husband and wife. Divorce is a spiritual judgement and is therefore passed in the ecclesiastical court. It is of two kinds: viz.

1. **DIVORCE A MENSA ET THORO**, *i. e.* from bed and board. In this case the wife has a suitable separate maintenance allowed her, out of her husband's effects.

2. **DIVORCE A VINCULO MATRIMONII**, *i. e.* from the bonds of matrimony, is strictly and properly divorce. This happens either in consequence of criminality, as in the case of adultery, or through some essential impediment, as consanguinity or affinity within the degrees forbidden, pre-contract, impotency, &c. of which impediments the canon law allows no less than 14. In these cases the woman receives again only what she brought with her. Sentences which release the parties a vinculo matrimonii, on account of impuberty, frigidity, consanguinity, within the prohibited degrees, prior marriage, or want of the requisite consent of parents or guardians, are not properly dissolutions of the marriage contract, but judicial declarations that there never was any marriage; such impediment subsisting at the time as rendered the celebration of the marriage rite a mere nullity. And the rite itself contains an exception of these impediments. "The law of Moses, says Mr. Paley, for reasons of local expediency, permitted the Jewish husband to put away his wife; but whether for every cause, or for what cause, appears to have been controverted amongst the interpreters of those times. Christ, the precepts of whose religion were calculated for more general use and observation, revokes this permission, as given to the Jews "for their hardness of heart," and promulges a law which was thenceforward to confine divorces to the single cause of adultery in the wife. (Mat. xix. 9.) Inferior causes may justify the separation of husband and wife, although they will not authorize such a dissolution of the marriage-contract as would leave either at liberty to marry again: for it is that liberty in which the danger and mischief of divorces principally consist. The law of this country, in conformity to our Saviour's injunction, confines the dissolution of the marriage-contract to the single case of adultery in the wife; and a divorce, even in that case, can only be brought about by the operation of an act of parliament, founded upon a previous sentence in the spiritual court, and a verdict against the adulterer at common law: which proceedings taken together compose as complete an investigation of the complaint as a cause can receive. It has lately been proposed to the legislature to annex a clause to these acts, restraining the offending party from marrying with the companion of her crime, who, by the course of proceeding, is always known and convicted: for

there is reason to fear, that adulterous connections are often formed with the prospect of bringing them to this conclusion; at least, when the seducer has once captivated the affection of a married woman, he may avail himself of this tempting argument to subdue her scruples, and complete his victory; and the legislature, as the business is managed at present, assists by its interposition the criminal design of the offenders, and confers a privilege where it ought to inflict a punishment. The proposal deserved an experiment; but something more penal, it is apprehended, would be found necessary to check the progress of this alarming depravity. Whether a law might not be framed, directing the fortune of the adulteress to descend as in case of her natural death; reserving, however, a certain proportion of the produce of it, by way of annuity, for her subsistence (such annuity in no case to exceed a certain sum); and also so far suspending the estate in the hands of the heir, as to preserve the inheritance to any children she might bear to a second marriage, in case there was none to succeed in the place of their mother by the first: whether such a law would not render female virtue in higher life less vincibile, as well as the seducers of that virtue less urgent in their suit, I would recommend to the deliberation of those who are willing to attempt the reformation of this important, but most incorrigible, class of the community. A passion for splendor, for expensive amusements and distinctions, is commonly found in that description of women who would become the subjects of such a law, not less inordinate than their other appetites. A severity of the kind proposed applies immediately to that passion. And there is no room for any complaint of injustice, since the provisions above-stated, with others which might be contrived, confine the punishment, so far as it is possible, to the person of the offender; suffering the estate to remain to the heir, or within the family of the ancestor from whom it came, or to attend the appointments of his will." Moral and Political Philosophy, p. 273.

DIURETICS, [*diuretica*, Gr.] a term applied to those medicines which increase the secretion of urine in the kidneys. Their operation consists in promoting the circulation of the blood towards the renal arteries, rendering that vital fluid more serous, and at the same time stimulating the secretory organs.

DIURIS, in botany, a genus of the gynandria diandria class and order. Nectary dependent; petals nine; the five outer ones very large; of two shapes; column of the fructification reversed, with a lid at top. One species only is known.

DIURNAL, in astronomy, something relating to the day, in opposition to nocturnal, which regards the night.

DIURNAL ARCH, the arch or number of degrees that the sun, moon, or stars, describe from their rising to their setting.

DIURNAL MOTION OF A PLANET, is so many degrees and minutes as any planet moves in twenty-four hours. Hence the motion of the earth about its axis, is called its diurnal motion. See **ASTRONOMY**.

DIVUS, and **DIVA**, in antiquity, appellations given to men and women who had been deified, or ranked among the gods.

DIVY POINT, a cape of Hindostan, in the bay of Bengal. Lon. 81. 20. E. Lat. 15. 55. N.

DIXAN, the first town of Abyssinia, on the side of Taranta. Lon. 40. 7. E. Lat. 14. 57. N.

DIXMUDE, or **DYMUDE**, a town of France, in the department of Lys, 11 miles S. of Ostend.

DIZIER, Sr. a town of France, in the department of Upper Marne. Lon. 4. 54. E. Lat. 48. 35. N.

DMITRIEU SUOPA, a town of Russia, in the government of Kursk, 20 miles N. N. W. of Kursk. Lon. 53. 30. E. Lat. 52. 5. N.

DNIEPER, **DNEPER**, or **NIEPER**, the ancient Boristhenes, a large river of Europe, rising in Smolenskow, running a long course in a S. direction, and falling into the Black Sea, between Cherson and Oczakow.

DNIESTER, or **NIESTER**, a fine river of Europe, which rises in Galicia, in Austrian Poland, and falls into the Black Sea, between the mouths of the Dnieper and the Danube.

DO, in music, a note of the Italian scale, corresponding to ut of the common gamut. See **MUSIC**.

DOAB, or **DOOAB**, a territory of Hindostan Proper, between the Ganges and the Jumna.

DOBBS, a district of N. Carolina.

DOBELIN,

DOBELIN, or **DOBLEN**, a town in the duchy of Courland; 20 miles S. W. of Mittau.

DOBEZIN, or **DOBEZYN**, a town of Great Poland, in Cujavia, 68 miles N. of Warsaw.

DOBOY, a small American island, in the Atlantic, near the coast of Georgia. Lon. 81. 31. W. Lat. 31. 28. N.

DOBRAKOTZ, a town of Hungary, 19 miles S. of Symontornya.

DOBRATA, a town of European Turkey, in the province of Moldavia, 40 miles W. of Jassy.

DOBRENIZ, a town of Bohemia, in the circle of Konigin-gratz: 8 miles S. W. of Konigingratz.

DOBUNI, or **BODUNI**, an ancient people of Britain, who possessed the territory which now forms the counties of Oxford and Gloucester. Both the names of this British nation seem to have been derived from the low situation of a great part of the country which they inhabited: for both *duon* and *bodun* signify "profound" or "low," in the ancient language of Gaul and Britain. The Dobuni are not mentioned among the British nations who resisted the Romans under Julius Cæsar, which was probably owing to the distance of their country from the scene of action; and before the next invasion under Claudius, they had been so much oppressed by their ambitious neighbours the Cattivellauni, that they submitted with pleasure to the Romans, to be delivered from that oppression.

DOCE, or **FRESH WATER RIVER**, a river of South America, in Brasil, which runs into the Atlantic.

DOCETÆ, [from *δοkein*, to appear,] in ecclesiastical history, the followers of Julius Cassianus, one of the Valentinian sect, towards the close of the second century, who revived a notion that had been adopted by a branch of the Gnostics, against whom St. John, Ignatius, and Polycarp, had asserted the truth of the incarnation. They believed and taught, as their name imports, that the actions and sufferings of Jesus Christ were not in reality, but only in appearance.

DOCIMASIA, in Greek antiquity, a probation of the magistrates and persons employed in public business at Athens.

DOCIMASTIC ART, a name given to the art of assaying by operations in small, the nature and quantity of metallic or other matters which may be obtained from mineral, or other compound bodies. See **METALLURGY**.

DOCIMASTIC HUNDRED, or **CENTNER**, in metallurgy and assaying, is a weight divisible, first into 100, and thence into smaller parts; but though the word is the same both with the assayers and metallurgists, yet it is to be understood as expressing a very different quantity in their different acceptance of it. The weights of the metallurgists are easily understood, being of the common proportion, but those of the assayers are a thousand times smaller than these, as the portions of metals or ores examined by the assayers are usually very small. The metallurgists, who extract metals out of their ores, use a weight divided into 100 equal parts, each part a pound; the whole they call a centner, or hundred weight; the pound is divided into 32 parts, or half ounces; and the half-ounce into two quarters of ounces, and these each into two drams. These divisions and denominations of the metallurgists are easily understood; but the same words used by assayers express very different quantities; for as the centner of the metallurgists contains 100lb. the centners of the assayers is really no more than one dram, to which the other parts are proportioned.

DOCIMENOS, in ancient geography, a city of Phrygia, afterwards called Synaia.

DOCIMENUM MARMOR, a name given by the ancients to a species of marble of a bright and clear white, much used in large and sumptuous buildings, such as temples and the like.

DOCK, in botany. See **RUMEX**.

DOCK. 1. The stump of the tail, which remains after docking.
2. The solid part of the tail.

Dock, in the manege, is used for a large case of leather, as long as the dock of a horse's tail, which serves it for a cover. The French call the dock trousseneue. It is made fast by straps to the crupper, and has leathern thongs that pass between his thighs, and along his flanks to the saddle straps, in order to keep the tail tight, and to hinder it from whisking about.

Dock, [as some imagine of *δοκιν*,] in maritime affairs, a broad and deep trench, formed on the side of a harbour, or on the bank of a river, and commodiously fitted either to build ships in, or

receive them to be repaired. These docks have generally strong flood-gates, to prevent the flux of the tide from entering the dock while the ship is under repair.

Dock, Wet, is a dock, where a ship can only be cleaned during the recess of the tide, or in the interval between the time when the tide leaves her a-ground, and the period when it again reaches her by the return of the flood. The largest and most commodious docks in this country, or perhaps in the world, are those constructed of late years at Liverpool.

Dock YARDS, magazines containing all sorts of naval stores and timber for ship-building. In England, the royal dock-yards are at Chatham, Portsmouth, Plymouth, Deptford, Woolwich, and Sheerness. The ships and vessels of war which belong to the nation, are generally moored at these ports, during the time of peace; and such as want repairing are taken into the docks, examined, and refitted for service. The principal dock-yards are governed by a commissioner resident at the port; who superintends all the musters of the officers, artificers, and labourers, employed in the dock-yard. He also controuls the payments therein; examines the accounts; contracts, and draws bills on the navy-office to supply the deficiency of stores; and regulates whatever belongs to the dock-yard, maintaining due order in the respective offices. These yards are generally supplied from the northern states with hemp, pitch, tar, rosin, canvas, oak-plank, and several other articles. Masts, particularly those of the largest size, are usually imported from New England. Of late years plans have been brought forward and executed for improving the London docks; making wet-docks for the West India shipping only; and others for the East India shipping only, these have proved very advantageous to the commerce of the port of London, and to the companies who raised the money for accomplishing them.

Dock COMPANY, LONDON. This company was established by an act of 39 and 40 Geo. III. passed the 20th of June, 1800, by which they were empowered to raise a capital stock of 1,200,000*l*. This has since been increased; so that the total capital stock which the company are authorized to raise, if necessary, is 2,200,000*l*. The company is under the management of twenty-four directors, who are elected annually. Two general courts of proprietors are held every year, at which all persons are entitled to vote who possess 500*l*. stock or upwards. The dividends on their stock are restricted to 10 per cent. per annum, and are paid on the 1st of January, and the 1st of July. The present dividend is 5½ per cent, and the company pay the property tax thereon. The dividends are paid, and transfers made on any day except holidays. The company was required to complete the docks within seven years, and so early as the close of January, 1805, the dock was opened for public use.

Dock COMPANY, WEST INDIA. This company was established by an act of 39 Geo. III. passed the 12th of July, 1799, and was empowered to raise a joint stock of 500,000*l*. with liberty to increase the same to 600,000*l*. which has since been increased to 1,200,000*l*. The company is under the management of twenty-one directors, eight of whom must be members of the corporation of London. They are elected annually, five going out every year for three years, and six the fourth year. Two general meetings of proprietors are to be held every year, in January and July, at which all persons are entitled to vote who hold 500*l*. stock, or upwards. Votes may be given by power of attorney. The present dividend is 10 per cent. per annum, and becomes due the 1st of January, and the 1st of July. The dividends are payable every day, and the company pay the property tax thereon. The dock was opened in August, 1802.

Dock COMPANY, EAST INDIA. This company was established by an act of 43 Geo. III. passed the 27th of July, 1803, and was authorized to raise a capital of 200,000*l*. divided into shares of 100*l*. each. They have since been empowered to increase their capital to 400,000*l*. nearly the whole of which has been raised. They were to pay five per cent. interest on the money advanced; and after the docks should be completed to make dividends not exceeding 10 per cent. per annum. The company is under the management of thirteen directors, who must be holders of at least twenty shares of the company's stock, and four of them must be directors of the East India company. They are elected annually in July, and three go out every year. Two general meetings are held yearly, in January and July, at which proprietors of five shares and upwards are entitled to vote. They must also be di-

rectors of the East India company, or have been so within two years, or be an agent, husband, consignee, or owner, to the value of 500*l.* or upwards, of East India shipping. The present dividend is at the rate of five per cent. per annum, and is payable at Lady-day and Michaelmas, every day except Fridays, between the hours of eleven and two o'clock. The dock was opened in August, 1806.

DOCKET, a little bill tied to wares or goods, directed to the person or place they are to be sent to.

DOCKET, or **DOGGET**, in law, signifies a brief in writing, made on a small piece of paper, or parchment, containing the purport and effect of a large writing. The rolls of judgement, when brought into the court of common pleas, are entered on the docket of that term: and attorneys keep docket-books, wherein they enter judgements.

DOCKUM, a river and town of Batavia, in the department of Eems, 10 miles N. E. of Lewarden.

DOCTOR, [*διδασκαλος*], in the Greek church, is a particular officer appointed to interpret part of the scriptures: He who interprets the Gospels, is called doctor of the Gospels; he who interprets St. Paul's Epistles, doctor of the Apostle; he who interprets the Psalms, doctor of the Psalter.

DOCTOR is also an appellation adjoined to several specific epithets, expressing the merit of the schoolmen: thus, Alexander Hales is called the irrefragable doctor; Thomas Aquinas, the angelic doctor; St. Bonaventure, the seraphic doctor; John Duns Scotus, the subtle doctor; Raimond Lully, the illuminated doctor; Roger Bacon, the admirable doctor, &c.

DOCTOR OF THE CHURCH, a title given to certain fathers whose doctrines and opinions have been the most generally followed and authorized.

DOCTOR OF THE LAW, a title of honour among the Jews. The investiture of this order was performed by putting a key and table book in their hands; which is what some authors imagine our Saviour alluded to, when, speaking of the doctors of the law, (Luke xi. 52,) he says, "Wo unto you doctors of the law, for ye have taken away the key of knowledge: ye enter not in yourselves, and them that were entering ye hindered."

DOCTOR, ORIGIN OF THE DEGREE OF. The establishment of the doctorate, such as now in use among us, is ordinarily attributed to Ireneus, who himself drew up the formulary. The first ceremony of this kind was performed at Bologna, in the person of Bulgarius, who began to profess the Roman law, and on that occasion was solemnly promoted to the doctorate, *i. e.* installed *juris utriusque* doctor. But the custom was soon transferred from the faculty of law to that of theology; the first instance whereof was given in the university of Paris, where Peter Lombard, and Gilbert de la Portree, the two chief divines of those days, were created doctors in theology, *sacrae theologiae doctores*. Spelman takes the title of doctor not to have commenced till after the publication of Lombard's sentences, about 1140; and affirms, that such as explained that work to their scholars were the first that had the appellation of doctors. Others go much higher, and hold Bede to have been the first doctor at Cambridge, and John de Beverly at Oxford, which last died A. D. 721. But Spelman will not allow doctor to have been the name of any title or degree in England, till the reign of king John, about 1207. By stat. 37 Henry VIII. c. 17. sect. 4. a doctor of the civil law may exercise ecclesiastical jurisdiction, though a layman.

DOCTOR, PRE-REQUISITES FOR PASSING IN ENGLAND. To pass D. D. at Oxford, it is necessary the candidate have been four years bachelor of divinity. For LL. D. he must have been seven years in the university to commence LL. B. five years after which he may be admitted doctor. Otherwise, in three years after taking the degree of M. A. he may take the degree of LL. B. and in four years more that of LL. D. which method and time are likewise required to obtain the degree of M. D. At Cambridge, to take the degree of D. D. it is requisite that the candidate have been seven years B. D. though in several of the colleges the taking of the bachelor's degree is dispensed with, and they may go out per saltum. To commence LL. D. the candidate must have been five years LL. B. or seven M. A. To pass M. D. he must have been five years B. D. or seven years M. A.

DOCTORS COMMONS. See **COLLEGE**.

DOCUMENT, in law, some written monument produced in proof of any thing asserted.

DODARTIA, a genus of the angiospermia order, and didynamia class of plants; natural order, Personatae. Calyx quinque-dentated; under lip of the corolla twice as long as the upper; capsule bilocular, globose. Two species, natives of India.

DODBROOK, a town in Devonshire, 15½ miles S. W. of Dartmouth, and 219 W. S. W. of London.

DODD, DR. WILLIAM, an unfortunate English divine, eldest son of the rev. W. Dodd, vicar of Bourne, in Lincolnshire, was born May 29, 1729. He was sent to Cambridge, in 1745. In 1749-50 he took the degree of B. A. with great honour, being upon that occasion in the list of wranglers. Leaving the university, he married Miss Mary Perkins in 1751; was ordained a deacon the same year; priest in 1753, and soon became a celebrated and popular preacher. By the patronage of bishop Squire, he, in 1763, obtained a prebend of Brecon, and by the interest of some city friends, was appointed one of the king's chaplains; soon after which he had the care of the education of the earl of Chesterfield. In 1766 he took the degree of LL. D. At this period, the estimation in which he was held by the world was sufficient to give him expectations of preferment, and hopes of riches and honours; and these he might probably have acquired, had he possessed a common portion of prudence. But, impatient of his situation, and eager for advancement, he rashly fell upon means which in the end were the occasion of his ruin. When the living of St. George, Hanover-square, became vacant, he wrote an anonymous letter to the chancellor's lady, offering 3000 guineas if by her assistance he was promoted to it. This being traced to him, complaint was immediately made to the king, and Dr. Dodd was dismissed with disgrace from his office of chaplain. From this period he lived neglected, if not despised; and his extravagance and difficulties increasing, he forged lord Chesterfield's name to a bond for 4200*l.* in hopes of being able to take it up before it was due, but the fraud was discovered, and he was tried and condemned, February 24, 1777. Great exertions were made to save his life, but in vain, and he was executed at Tyburn, June 27th following. He expressed deep contrition for his crimes, and for the scandal which he had brought on his profession. He published a translation of the poems of Callimachus; four volumes of sermons on the Miracles and Parables; a collection of Poems; Reflections on Death, 12mo. Comfort for the Afflicted, 8vo, and after his death appeared his Thoughts in Prison, with his life prefixed.

DODECAHEDRON, [from *δώδεκα*, twelve, and *ῥῆμα*, base,] is one of the Platonic bodies, or five regular solids, and is contained under twelve equal and regular pentagons. The solidity of a dodecahedron is found by multiplying the area of one of the pentagonal faces of it by twelve; and then this latter product by one-third of the distance of that face from the centre of the dodecahedron, which is the same as the centre of the circumscribing sphere.

DODDRIDGE, PHILIP, D. D. an eminent Presbyterian minister, the son of Daniel Doddridge, an oilman in London, where he was born on the 26th of June, 1702. Having completed the study of the classics, he was, in 1719, placed under the tuition of the rev. John Jennings, who kept an academy at Kilworth in Leicestershire. He was first settled as a minister at Kilworth, where he preached to a small congregation in an obscure village; but, on Mr. Jennings's death, succeeded to the care of his academy; and soon after was chosen minister by a large congregation of Dissenters at Northampton, to which he removed his academy, and where the number of his pupils increased. He instructed them with the freedom and tenderness of a father; and never desired that they should blindly follow his sentiments, but encouraged them to judge for themselves. He checked any appearance of bigotry and uncharitableness, and endeavoured to cure them by shewing what might be said in defence of those principles they disliked. Yet while he was thus liberal as to the opinions of others, he was so steady to his own principles that he refused a very genteel offer of patronage made him by the Duchess of Bedford, on condition of his turning over to the church of England. A pulmonary complaint brought on a consumption, for which he was advised to try the Bristol waters, and these proving ineffectual, he went to Lisbon, where he died in 1751. Though tender in his constitution, he published a number of excellent works, the principal of which are, his Family Expositor on the New Testament, 6 vols. 4to.; the Rise and Progress of Religion in the Soul, of which numerous editions have been printed; the Life of Colonel Gardiner; and

and Sermons on the Evidences of Christianity. His single sermons and tracts were collected in 8 vols. 12mo. after his death: also his Hymns; Lectures on Pneumatology, Ethics, and Divinity; and a volume of his Letters, by Mr. Stedman of Shrewsbury.

DODECAGYNIA, [from *dodeka*, twelve, and *gyni*, a woman,] the fifth order in the class dodecandria; consisting of plants, which, along with the general characteristics of the class, have twelve female organs. See **BOTANY**.

DODECANDRIA, [from *dodeka*, twelve, and *andri*, a man,] the eleventh class in Linnaeus's sexual system, consisting of plants with hermaphrodite flowers, that have twelve male organs. It is not, however, limited to this number. Many genera have sixteen, eighteen, and even nineteen stamina. The essential character is, that the stamina, however numerous, are inserted into the receptacle. See **BOTANY**.

DODECAS, a genus of the trigynia order, and dodecandria class of plants. Calyx half-quadrifid having the corolla above; corolla quinquefid, capsule unilocular, conjoined with the calyx. One species only is known.

DODECATEMORION, [*dodekateimonion*,] the twelfth part.

DODECATHEON, **MEDIA**, a genus of the monogynia order, and pentandria class of plants: natural order *Preciæ*. Corolla verticillated, reflexed; stamina placed in the tube; capsule unilocular, oblong. It has one species.

DODO, in ornithology. See **DIPODUS**.

DODONA, a town of Thesprotia in Epirus, or, as some say, in Thessaly. There was in its neighbourhood a celebrated oracle of Jupiter. The oracles of Dodona were generally delivered by women.

DODONÆA, a genus of the monogynia order, and octandria class of plants. Calyx tetraphyllous; no corolla; capsule trilobular, inflated; seeds two-fold. It has two species.

DODONÆUS, or **DODONIAN**, in antiquity, an epithet given to Jupiter, because he was worshipped in a temple built in the forest of Dodona.

DODONIES, the priestesses who gave oracles in the temple of Jupiter, in Dodona. According to some traditions the temple was originally inhabited by the seven daughters of Atlas, who nursed Bacchus. Their names were Ambrosia, Eudora, Pasithoe, Pytho, Plexaure, Coronis, and Tyche.

DODRANS, in antiquity, three-fourths of the as, or nine uncia.

DOE, in zoology. See **CERVUS**.

DOEG, [דג, Heb. *i. e.* careful,] the Edomite, a bloody villain, who acted in the quadruple character of chief herdsman, informer, accuser, and executioner, to king Saul. His monstrous barbarity in murdering the whole people of Nob, men, women, and children, at the mandate of the enraged monarch, when even his own footmen refused to obey his iniquitous order (1 Sam. xxii. 17), affords one of the numberless instances, with which both sacred and profane history abound, of the dreadful effects of despotic power.

DOESBURG, a town of Holland, in the department of Yssel, 10 miles S. S. W. of Zutphen.

DOFREFIELD, or **DOFRINE**, the highest peak of the mountains, which divide Norway from Sweden.

DOG, in zoology, an animal remarkable for its natural docility, fidelity, and affection, for its master; qualities which mankind are careful to improve for their own advantage. See **CANIS**. In several parts of Africa and China, dogs are eaten, as well as by the West Indian negroes, and accounted excellent food; and we have the testimony of Mr. Forster, that dogs flesh, in taste, exactly resembles mutton. They were also used as food by the Romans, and long before them by the Greeks, as we learn from several treatises of Hippocrates. Dogs bred in Britain are justly reckoned superior to the dogs bred in any other country. The swiftness of the greyhound is amazing: as are also the steadiness and perseverance of other hounds and beagles; the boldness of terriers in unearthing foxes, &c.; the sagacity of pointers and setting dogs, who are taught a language by signs as intelligible to sportsmen as speech; and the invincible spirit of a bull-dog, which can be conquered only by death. All the nations in Europe not only do justice to the superior qualities of the British dogs, but adopt our terms and names, and thankfully receive the creatures as presents. It is remarkable, however, that almost every kind of British dogs degene-

rate in foreign countries; nor is it possible to prevent this degeneracy by any art whatever.

DOGADO, [Ital. *i. e.* duchy,] a province of Italy, in Venice, comprehending that part of the state in which the city of Venice lies.

DOGATE, [Ital. *dogado*, from *ducatus*, Lat. a duchy,] the late office of doge, in the late aristocracies of Genoa and Venice.

DOG-BANE, in botany. See **APOCYNUM**.

DOG-DAYS, the days in which the dog-star rises and sets with the sun, vulgarly reputed unwholesome.

DOG-DAYS. See **CANICULA**.

DOGE properly signifies duke, being formed from the Latin *dux*. The dogate, or office and dignity of doge, was elective; at Venice, he was elected for life; at Genoa, only for two years; he was addressed under the title of Serenity, which was esteemed superior to that of Highness.

DOG-FISH. See **SQUALUS**.

DOGGER, a Dutch fishing-vessel navigated in the German Ocean. It is generally employed in the herring fishery.

DOGGERS, in the English alum works, a name given by the workmen to a sort of stone found in the same mines with the true alum-rock, and containing some alum, though not near so much as the right kind.

DOGMATISTS, a sect of the ancient physicians, of which Hippocrates was the founder. They are also called *logici*, logicians, from their using the rules of logic in medical subjects. They laid down definitions and divisions; reducing diseases to certain genera, and those genera to species, and furnishing remedies for them all; supposing principles, drawing conclusions, and applying those principles and conclusions to particular diseases under consideration: in which sense the dogmatists stand contradistinguished from empirics and methodists. They reject all medicinal virtues that they think not reducible to manifest qualities; but Galen has long ago observed, that they must either deny plain facts, or assign but very poor reasons and causes of many effects they pretend to explain. See **MEDICINE**.

DOG-RIBBED INDIANS, a nation of North Americans, who inhabit round lake Edlande, in the N. W. part of North America. They are often at war with the Arathapescow Indians. Both these tribes are among the most savage of the human race. They trade with the Hudson bay company's settlements.

DOG'S HEAD, a cape on the W. coast of Ireland, in Galway. Lon. 10. 8. W. Lat. 53. 54. N.

DOG'S ISLAND, one of the smaller Virgin islands, W. of Virginia Gorda, and E. of Tortula. Lon. 62. 55. W. Lat. 18. 20. N.

DOG'S STONES, in botany. See **ORCHIS**.

DOG-STAR. See **CANICULA**, and **SIRIUS**.

DOIAGOI, an island of Russia, in the Frozen Sea, at the entrance of the straits of Vagaskoi.

DOIT, the ancient Scots penny piece, of which twelve were equal to a penny sterling. It was a small copper coin, as thin as a silver penny, and not much larger.

DOL, a town of France, in the department of Ille and Vilaine, and late province of Bretagne, 27 miles W. of Paris.

DOLCE AQUA, a town of Piedmont, in the county of Nice, 16 miles E. N. E. of Nice.

DOLCINGO, a strong town of European Turkey, in Albania, 10 miles S. E. of Antivari.

DOLE, a town of France, in the department of Jura, and late province of Franche Comté, 23 miles W. S. W. of Besançon. Lon. 5. 38. E. Lat. 47. 6. N.

DOLE, in Scots law, signifies a malevolent intention.

DOLEGELLY, **DOLGELLY**, or **DOLGETH**, a town of North Wales, in Merionethshire, 46 miles S. of Caernarvon.

DOLICHOS, a genus of the decandria order, and diadelphica class of plants; natural order Papilionaceæ. Basis of the vexillum has two callous knobs, oblong, parallel, and compressing the ala below. There are thirty-eight species, chiefly herbaceous annuals, and natives of the Indies.

DOLIOCARPUS, in botany, a genus of the polyandria monogynia class and order. Calyx five-leaved; corolla three-petaled, plaited; stigma subtrifid; berry globular, crowned with the style, one-celled, two-seeded. Three species, shrubs of Guiana.

DOLLAR, in this country, is chiefly applied to the Spanish silver coin, otherwise called a piece of eight. Dollars are also

coined in different parts of Germany and Holland; and have their subdivisions, into semi-dollars, quarter-dollars, &c. See MONEY. They are of various fineness and weight. In the Levant the Dutch dollars are called *astani*, from the impression of a lion on them.

DOLLENDORF, a town of Germany, in Westphalia.

DOLLEREN, a river of France, in the department of the Upper Rhine.

DOLPHIN, in ichthyology. See DELPHINUS.

DOLPHIN OF THE MAST, in sea language, a peculiar kind of wreath, formed of plaited cordage, to be fastened occasionally round the masts, as a support to the puddening, whose use is to sustain the weight of the fore and main yards in case the rigging or chains by which those yards are suspended should be shot away in the time of battle; a circumstance which might render their sails useless at a season when their assistance is extremely necessary.

DOLPHIN'S ISLAND, an island in the straits of Magellan. Lon. 71. 41. W. Lat. 53. 59. S.

DOM, or **DON**, [an abridgement of *domnus*, from *dominus*,] a title of honour, invented and chiefly used by the Spaniards, signifying sir or lord. See DON.

DOM AND SOM, in old charters, signifies full property and jurisdiction.

DOMAIN. See DEMESNE.

DOMAT, JOHN, a celebrated French lawyer, born in 1625, who, observing the confused state of the laws, digested them in 4 vols. 4to. under the title of *The Civil Laws in their Natural Order*: for which Louis XIV. settled on him a pension of 2000 livres. Donat was intimate with the famous Pascal, who left him his private papers at his death: he died in 1696.

DOMAZLIZE, a town of Bohemia, in the circle of Pilsen, 17 miles S. of Pilsen.

DOMBACA, a small island near the coast of Ava, in the bay of Bengal. Lon. 94. 35. E. Lat. 17. 32. N.

DOMBES, a late principality of France, about 24 miles long, and 21 broad, lying on the W. bank of the Soane. Trevoux was the capital. It now forms part of the department of Ain.

DOMBEYA, in botany, a genus of the class and order diœcia monadelphia. Male, calyx of the ament; scales terminated by a leaflet; corolla none; anthers ten or twelve, without filaments. Female, calyx ament, with many germs; corolla none; stigma bivalve, unequal; seeds many, in a roundish strobile. There is one species, a tree of Chili.

DOME, [*domus*, Lat. *house*,] in architecture, is a roof of a hemispherical form, raised over the middle of a building, as a church, hall, pavilion, vestibule, stair-case, &c. by way of crowning. Domes are the same with what the Italians call *cupolas*; or, according to Vitruvius, *tholi*. They are usually made round; though we have instances of square ones; as those of the Louvre; and others that are polygons, as that of the ci-devant Jesuits church in the Rue St. Antoine at Paris. They have usually columns ranged around their outsides, both by way of ornament, and to support the vault. See a plan and elevation of a circular dome constructed without entering: Plate LIV. fig. 4. The first course consists of the stones marked 1, 1, of different sizes (the large ones exactly twice the height of the small ones,) placed alternately, and forming intervals to receive the stones marked 2, which rise half their height above the large ones of the first course, and leave alternate intervals as before for those marked 3: the other courses are continued in the same manner, according to the order of the figures, to the top. It is evident from the converging or wedge-like form of the intervals, that the stones they receive can only be inserted from the outside, and cannot fall through; therefore the whole dome may be built without centering or temporary support. To break the upright joints, the stones may be cut of the form as at A, and those marked 16, 17, &c. near the key-stone, may be enlarged, as at B.

Dome, in chemistry, the upper part of furnaces, particularly portable ones. It has the figure of a hollow hemisphere, or small dome. Its use is to form a space in the upper part of the furnace, the air of which is continually expelled by the fire: hence the current of air is considerably increased, which is obliged to enter by the ash-hole, and to pass through the fire, to supply the place of the air driven from the dome. The form of this piece renders it proper to reflect or reverberate a part of the flame upon matters

which are in the furnace, which has occasioned this kind of furnace to be called a reverberatory one. See CHEMISTRY.

DOME, or **DOOM**, signifies judgement, sentence, or decree. The homagers oath in the black book of Hereford ends thus: "So help me God at his holy dome, and by my trowthe."

DOMESDAY, or **DOOMSDAY BOOK**, a most ancient record, made in the time of William I. and containing a survey of all the lands of England. It consists of two volumes. The first is a large folio, written on 382 double pages of vellum, in a small but plain character; each page having a double column. Some of the capital letters and principal passages are touched with red ink; and some have strokes of red ink run across them; as if scratched out. This volume contains the description of 31 counties. The other volume is in 4to, written upon 450 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, Suffolk, part of the county of Rutland included in that of Northampton, and part of Lancashire in the counties of York and Chester. This work, according to the red book in the exchequer, was begun by order of William the Conqueror, with the advice of his parliament, in the year of our Lord 1080, and completed in the year 1086. The reason given for taking this survey, as assigned by several ancient records and historians, was, that every man should be satisfied with his own right, and not usurp with impunity what belonged to another. But, besides this, it is said by others, that now all those who possessed landed estates became vassals to the king, and paid him so much money by way of homage, in proportion to the lands they held. This appears very probable, as there was at that time extant, a general survey of the whole kingdom, made by order of king Alfred. For the execution of the survey recorded in domesday book, commissioners were sent into every county and shire; and juries summoned in each hundred, out of all orders of freemen, from barons down to the lowest farmers. These commissioners were to be informed by the inhabitants, upon oath, of the name of each manor, and that of its owner; also by whom it was held in the time of Edward the Confessor; the number of hides; the quantity of wood, of pasture, and of meadow land; how many ploughs were in the demesne, and how many in the tenanted part of it; how many mills, how many fish-ponds, or fisheries belonged to it; with the value of the whole together in the time of king Edward, as well as when granted by king William, and at the time of this survey; also whether it was capable of improvement, or of being advanced in its value: they were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them, what was the number of villains or slaves, and also the number and kinds of their cattle and live stock. These inquiries being first methodized in the country, were afterwards sent up to the king's exchequer. This survey, at the time it was made, gave great offence to the people; and occasioned a jealousy that it was intended for some new imposition. But notwithstanding all the precaution taken by the conqueror, to have this survey faithfully and impartially executed, it appears from indisputable authority, that a false return was given in by some of the commissioners; and that, as it is said, out of a pious motive. However, the authority of domesday book was never permitted to be called in question; and always, when it has been necessary to distinguish whether lands were held in ancient demesne, or in any other manner, recourse was had to that only, to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at domesday, or the day of judgement, there could be no appeal, the name of the book is said to have been derived. But Stowe assigns another reason for this appellation; namely, that domesday book is a corruption of *domus Dei* book; a title given it because heretofore deposited in the king's treasury, in a place of the church of Westminster, or Winchester, called *domus Dei*. From the great care formerly taken for the preservation of this survey, we may learn the estimation in which its importance was held. The dialogue de Scaccaris says, "*Liber ille (Domesday) sigilli regis comes est individuis in thesauro.*" Until lately it has been kept under three different locks and keys; one in the custody of the treasurer, and the others in that of the two chamberlains of the exchequer. It is now deposited in the chapter-house at Westminster, where it may be consulted on paying to the proper officers a fee of 6s. 8d. for a search, and 4d. per line for a transcript. Besides the two volumes

James above-mentioned, there is also a third made by order of the same king; and which differs from the others in form more than matter. There is also a fourth called domesday, which is kept in the exchequer; which, though a very large volume, is only an abridgement of the others. In the remembrancer's office in the exchequer is kept a fifth book, likewise called domesday, which is the same with the fourth book already mentioned.

DOMESTIC, in antiquity, was a particular officer in the court of Constantinople. According to some this officer was one entrusted to manage affairs of importance; others say the Greek domestici were the same with the Roman comites; and that they began first to be used when count became a dignity: domestics therefore were such as served the prince in the administration of affairs, as well those of the family as the affairs of justice and the church.

DOMESTIC HAPPINESS, the pleasures enjoyed in one's family, in distinction from those found in the bustle of public life, or delusively sought in the haunts of dissipation. See **PLEASURE**.

DOMFRONT, a town of France, in the department of Orne, 35 miles N. W. of Alencon. Lon. 0. 43. W. Lat. 48. 38. N.

DOMIFYING, in astrology, the dividing or distributing of the heavens into 12 houses, to erect a theme, by means of six great circles, called circles of position. Regiomontanus makes the circles of position pass through the intersections of the meridian and the horizon: others make them pass through the poles of the zodiac.

DOMINANT, among musicians, is used either as an adjective or substantive.

1. **DOMINANT**. The dominant or sensible chord is that which is practised upon the dominant of the tone, and which introduces a perfect cadence. Every perfect major chord becomes a dominant chord, as soon as the seventh minor is added to it.

2. **DOMINANT**, of the three notes essential to the tone, is that which is a fifth from the tonic. The tonic and the dominant fix the tone; in it they are each of them the fundamental sound of a particular chord; whereas the mediant, which constitutes the mode, has no chord peculiar to itself, and only makes a part of the chord of the tonic.

A **DOMINANT**, in that species of church music which is called plain chant, is that note which is most frequently repeated or beaten, in whatever degree it may be from the tonic. In this species of music there are dominants and tonics, but no mediant.

DOMINGO, Sr, or **HISPANIOLA**, an island in the Atlantic Ocean. See **HISPANIOLA**.

DOMINGO, Sr, the capital of the above island. Lon. 70. 10. W. Lat. 18°. 19' 30". N.

DOMINIC, **DE GUZMAN**, the founder of the Dominican order. See **DOMINICANS**.

DOMINICA, the last of the leeward or Caribbee islands, taking them from N. W. to S. E. so named by Christopher Columbus, from his having discovered it on Sunday, 3rd. November 1493. It is situated about half-way betwixt Guadaloupe on the N. W. and Martinico on the S. E. 15 leagues from each, between 15° 20' and 15° 44' 30" lat. N. and between 61° 17' and 61° 30' lon. W. It is about 29 miles long; and nearly 16 broad.

DOMINICA, a town in the island of Cuba, 45 miles W. of Havannah.

DOMINICA, or **HEEVAROA**, the largest of the Marquesas islands, extending E. and W. 18 miles. Lon. 139. 13. W. Lat. 9. 44. N.

DOMINICAL LETTER, in chronology, is that letter of the alphabet which points out in the calendar the Sundays throughout the year, thence also called Sunday-letter. See **CHRONOLOGY**. The Dominical Letter for any year may be found by the following rule. Add together the year, its fourth part, and the figures which remain from the fourth part after rejecting the units and tens; also reject the units and tens of the given year and add one to the remaining figures; subtract this from the foregoing sum, and divide the remainder by seven, and subtract what remains from seven, and the last remainder is the index of the letter required. N. B. If the given year exactly divides by 4, it is leap-year; and the Dominical Letter for January and February will be the one which immediately succeeds, in the order of the alphabet, that found by the above rule. Thus to find the Dominical Letter for 1809.

1809

452

Therefore BA will be the Dominical Letters; See the article Chronology in this work, pages 713, 781, and 782.

If the day of the month in any particular year on which any Sunday falls be given, the Sunday-letter may be found thus: divide the number of days from the first of January to the given Sunday inclusive by seven, and the remainder subtracted from 7 is the index of the letter: if nothing remains 7 is the index.

Example. The liberation of Sir Francis Burdett from the Tower and of Gale Jones from Newgate took place on the prorogation of the late session of parliament, which was on Thursday, June 21, of the present year; quære the Dominical Letter.

First, if the 21st of June, 1810, happened on a Thursday, the preceding Sunday must have taken place on June 17. Therefore, according to the rule, 31, the number of days in January, + 28, ditto in February, + 31, ditto in March, + 30, ditto in April, + 31, ditto in May, + 17, the given Sunday in June, = 168. And 168 divided by 7 = 24 and nothing over, consequently G is the Sunday-letter for this year, for 7 — 0 = 7, the index of the letter.

DOMINICANS, an order of religious, so named from their founder Dominic De Guzman, who preached with great zeal against the Albigenes in Languedoc, where he laid the first foundation of this order. It was approved of in 1215, by Innocent III, and confirmed in 1216, by a bull of Honorius III, under the title of St. Augustin; to which Dominic added several austere precepts and observances, obliging the brethren to take a vow of absolute poverty; to abandon entirely all their revenues and possessions; and to take the title of Preaching Friars, because the public instruction was the main end of their institution.

DOMINION, in the civil law, the power to use or dispose of things as we please.

DOMINION,

DOMINION, in theology, the fourth order of angels, in the hierarchy, reckoning from the seraphim. See **ANGEL**.

DOMINIS, **MARK ANTHONY DE**, archbishop of Spalatro in Dalmatia at the close of the 15th and beginning of the 16th centuries, was a man whose fickleness in religion proved his ruin. His preferment, instead of attaching him to the church of Rome, rendered him disaffected to it. Becoming acquainted with bishop Bedell, while chaplain to Sir Henry Wotton ambassador from James I. at Venice, he communicated his books "*De Republica Ecclesiastica*" to him; which were afterwards published at London, with Bedell's corrections. He came to England with Bedell; where he was received with great respect, and preached and wrote against the Romish religion. He is said to have had a principal hand in publishing father Paul's "*History of the Council of Trent*," at London, which was inscribed to King James, in 1619. But on the promotion of Pope Gregory XIV. who had been his school-fellow and old acquaintance, he was deluded by Gondomar the Spanish ambassador into the hopes of procuring a cardinal's hat, by which he fancied he should prove an instrument of great reformation in the church. Accordingly he returned to Rome in 1622, recanted his errors, and was at first well received; but he afterwards wrote letters to England, repenting his recantation; which being intercepted, he was imprisoned by Pope Urban VIII, and died in 1625. He was the author of the first philosophical explanation of the rainbow, which before his time was accounted a prodigy.

DOMINIUM, in civil law. See **DOMINION**.

DOMINIUM DIRECTUM, in Scots law, the right which a superior retains in his lands, notwithstanding the feudal grant to his vassal.

DOMINIUM EMINENS, in Scots law, that power which the state or sovereign has over private property, by which the proprietor may be compelled to sell it for an adequate price where public utility requires.

DOMINIUM UTILE, in Scots law, the right which the vassal acquires in the lands by the feudal grant from his superior.

DOMINUS, [Lat. *i. e.* a lord or master,] a title anciently prefixed to a name, usually to denote the person either a knight or a clergyman. The title was sometimes also given to a gentleman not dubbed; especially if he were lord of a manor.

DOMITZ, a town and fortress of Germany; in Lower Saxony. Lon. 11. 41. E. Lat. 53. 15. N.

DOMMART, a town of France, in the department of Somme, 12 miles N. W. of Amiens.

DOMMEL, a river of France which rises about the borders of the bishopric of Liege, and, passing by Bois-le-duc, joins the Meuse, and forms with that river and the Waal, the island of Bommel.

DOMMEL AND SCHELDT, one of the eight departments into which the Batavian republic was divided, in March 1798. Herzogenbusch is the chief city.

DOMO-D'OSCELA, **DOMO-D'OSCELLO**, or **DOMO-D'OSSOLA**, a town of the late Cisalpine republic, in the late duchy of Milan, S. W. of Lake Maggiore. Lon. 8. 25. E. Lat. 46. 2. N.

DOMPAIRE, an ancient town of France, in the department of Vosges, 9 miles W. N. W. of Epinal.

DOMREMY, a town of France, in the department of the Meuse, 10½ miles E. of Bar-le-duc.

DOMUS CONSERVORUM, the ancient name of the house where the rolls are kept in Chancery-Lane.

DON, [*dominus*, Lat.] the Spanish title for a gentleman; as, Don Quixote. See **DOM**. This title was first given to Pelayo, in the beginning of the eighth century. In Portugal no person can assume the title of Don without the permission of the sovereign, as it is reckoned a mark of honour and nobility. In France it was formerly used among the religious.

DON, a river of Russia, anciently called Tanais, which takes its rise from the small lake of St. John, near Tula, in the government of Moscow, and falls into the sea of Azof.

DON, a river of Scotland, in Aberdeenshire, which rises about four miles N. of the Castle of Brae-Mar.

DONAGHADEE, a sea-port town of Ireland, in the county of Down, Ulster; 21 miles W. of Port Patrick in Scotland. Lon. 5. 40. W. Lat. 54. 45. N.

DONARIA, among the ancients, in its primary signification,

was taken for the places where the oblations offered to the gods were kept; but afterwards was used to denote the offerings themselves; and sometimes, improperly, the temples.

DONATIA, a genus of the trigynia order, and triandria class of plants. Calyx three-leaved; corolla has from 8 to 10 petals of an oblong linear shape, twice as long as the calyx; anthers roundish, didymous, and two-lobed at the base. One species.

DONATION, in law, to be valid and complete, supposes a capacity both in the donor and the donee; and requires consent, acceptance, and delivery.

DONATION MORTIS CAUSA, in law, a disposition of property made by a person in his last sickness, who apprehending his dissolution near, delivers, or causes to be delivered to another, the possession of any personal goods, to keep in case of his decease. If the donor dies, this gift needs not the consent of his executor; but it shall not prevail against creditors; and it is accompanied with this implied trust, that, if the donor lives, the property shall revert to himself, being only given in prospect of death, or mortis causa. This method of donation seems to have been conveyed to us from the civil lawyers, who borrowed it from the Greeks.

DONATISTS, ancient schismatics in Africa, so denominated from their leader Donatus. They had their origin, A. D. 311, when, in the room of Mensurius, who died in that year on his return to Rome, Cæcilian was elected bishop of Carthage, and consecrated without the concurrence of the Numidian bishops, by those of Africa alone; whom the people refused to acknowledge, and to whom they opposed Majorinus; who, accordingly, was ordained by Donatus bishop of Casa Nigra. They were repeatedly condemned, in different councils held at Rome and Arles; and particularly in one at Milan, in 316, before Constantine the Great, who deprived them of their churches, banished their bishops, and punished some of them with death. Their cause was espoused by another Donatus, called the Great, the principal bishop of that sect, who, with numbers of his followers, was exiled by Constans. They are now nearly extinct. They were distinguished by other appellations; as Montenses, Campites, Rupites, &c. They held three councils, one at Cirta in Numidia, and two at Carthage. The errors of the Donatists were, 1. That baptism conferred out of the church, that is, out of their sect, was null; and accordingly they rebaptized those who joined their party from other churches, and reordained their ministers. 2. That their's was the only true, pure, and holy church; (an error common to bigots of all denominations;) all the rest of the churches they held as prostitute and fallen. Donatus seems likewise to have given into the doctrine of the Arians, with whom he was closely allied; and, accordingly, St. Epiphanius, Theodoret, and some others, accused the Donatists of Arianism; and it is probable that the charge was well founded, because they were patronized by the Vandals, who were of these sentiments. But St. Augustine (Ep. 185, to count Boniface, & Har. 69.) affirms, that the Donatists, in this point, kept clear of the errors of their leader.

DONATIVE, in the canon-law, is a benefice given by the patron to a priest, without presentation to the ordinary, and without institution or induction. If chapels founded by laymen be not approved by the diocesan, and, as it is called, spiritualized, they are not accounted proper benefices, neither can they be conferred by the bishop, but remain to the pious disposition of the founder, and their heirs, who may give such chapels without the bishop. Gwin observes, that the king might anciently found a free chapel, and exempt it from the jurisdiction of the diocesan; so may he, by letters patent, give liberty to a common person to found such a chapel, and make it donative, not presentable; and the chaplain or beneficiary, is deprivable by the founder or his heir, and not by the bishop. Donatives are within the statute against simony; and if they have cure of souls, within that against pluralities. If the patron of a donative does not nominate a clerk, there can be no lapse thereof, unless it be specially provided for in the foundation; but the bishop may compel him to do it by spiritual censures. But if it be augmented by queen Anne's bounty, it will lapse like other presentative livings, 1 Geo. I. stat. 2. cap. 10. The ordinary cannot visit a donative, and therefore it is free from procurator, and the incumbent is exempted from attendance at visitations. All bishoprics anciently were donative by the king. Where a bishop has the gift of a benefice, it is properly called a donative, because he cannot present to himself.

DONATIVE, or **DONATIVUM**, in antiquity, was properly a gift

gift made to the soldiers, as *congiarium* was to the people. The Romans made large donatives to their soldiers. Julia Pia, wife of the emperor Severus, is called on certain medals *mater castorum*, because of the care she took of the soldiery, by interposing for the augmentation of their donatives, &c.

DONATORY, in Scots law, that person to whom the king bestows his right to any forfeiture that has fallen to the crown.

DONAWERT, a town of Germany, in Bavaria on the frontiers of Suabia. 18 miles N. of Augsburg. Lon. 11. 5. E. Lat. 48. 52. N.

DONAX, a genus of insects of the class and order *vermes testacei*. Animal a tethys; shell bivalve, generally with a crenulate margin, the frontal margin very obtuse; hinge with two teeth, and a single marginal one placed a little behind, rarely double, triple, or none. There are nineteen species. *D. scortum* is a triangular heart-shaped shell, with a flat frontal margin. It inhabits the Indian ocean. *D. scripta* inhabits the coast of Malabar, it is elegantly painted with angular reddish, blue, or brown lines. *D. rugosa* is represented in Plate XXXVII.

DONCASTER, an ancient town, in the W. Riding of Yorkshire, 37 miles S. of York. Lon. 1. 12. W. Lat. 53. 33. N.

DONCHERRY, or **DONCHERY**, a fortified town of France, in the department of Ardennes, three miles from Sedan. Lon. 5. 2. E. Lat. 49. 42. N.

DONEGAL, a county of Ireland, in the province of Ulster, bounded on the E. by Londonderry; on the S. by Fermanagh; and on the W. and N. by the ocean. It is generally reckoned 68 miles long, and 44 broad. The surface is generally rugged and mountainous; in some places marshy, interspersed with several rich valleys. The principal towns are Donegal, Ballyshannon, Killbegs, Lifford, and St. Johnstown, which send two members each to parliament, besides two from the county.

DONEGAL, the capital of the county, 10 miles N. of Ballyshannon. Lon. 8. 30. W. Lat. 54. 42. N.

DONEGAL BAY, a large bay of the Atlantic, on the W. coast of Ireland.

DONERAIL, a borough of Ireland, in Cork, 19 miles N. E. of Cork.

DONETZK, a town of Russia, in the government of Ekaterinoslaw.

DONGALA, **DANGALA**, **DANCALA**, or **DANGOLA**, a town of Africa, in Nubia. Lon. 30. 35. E. Lat. 21. 0. N.

DONJON, a town of France, in the department of Allier, 24 miles S. E. of Moulins.

Donjon, in Fortification, commonly signifies a large tower, or redoubt of a fortress; whence the garrison may retreat in case of necessity, and capitulate with good advantage.

DONNE, **JOHN**, D. D. a poet and divine of the 17th century. His parents were of the Romish religion, and used their utmost efforts to keep him firm to it; but his early examination of the controversy between the church of Rome and the Protestants, at last determined him to choose the latter. He travelled into Italy and Spain; where he made many useful observations, and learned their languages to perfection. Soon after his return to England, Sir Thomas Egerton, keeper of the great seal, appointed him his secretary; in which post he continued five years. Marrying privately Anne, the daughter of Sir George Moore, then chancellor of the garter, he was dismissed from his place, and thrown into prison. But he was reconciled to Sir George by the good offices of Sir Francis Woolley. In 1612, he accompanied Sir Robert Drury to Paris. During this time, many of the nobility solicited the king for some secular employment for him. But king James who took pleasure in his conversation, had engaged him in writing his *Pseudo-Martyr*, printed at London in 1610; and was so highly pleased with that work, that, in 1614, he prevailed with him to enter into holy orders; appointed him one of his chaplains, and procured him the degree of D. D. from the university of Oxford. In 1619, he attended the earl of Doncaster in his embassy into Germany. In 1621, he was made dean of St. Paul's: and vicar of St. Dunstan, in London; the advowson of it having been given to him long before by Richard earl of Dorset. By these and other preferments, he was enabled to be charitable to the poor, kind to his friends, and to make good provision for his children. He wrote, besides the above, 1. Devotions upon emergent Occasions. 2. The Ancient History of the Septuagint, translated from the Greek of Aristeus, in 4to. 3. Three volumes of sermons,

VOL. I.—NO. 67.

folio. 4. A considerable number of poems: and other works. He died in 1631; and was interred in St. Paul's cathedral, where a monument was erected to his memory. His writings shew him to have been a man of wit and learning, and he was, however, highly celebrated by all the great men of that age.

DONNINGTON, or **DUNNINGTON**, a town in Lincolnshire, 11 miles W. S. W. of Boston.

DONNOE, a small island in the North sea, near the coast of Norway.

DONOR, in law, the person who gives lands or tenements to another in tail, &c. as he to whom such lands, &c. are given, is the Donee.

DONZY, a town of France, in the department of Nievre, 22 miles N. of Nevers.

DOOMSDAY BOOK. See **DOMESDAY BOOK**.

DOOR, in architecture, an aperture in a wall, to give entrance and exit into and out of a building, or any apartment thereof. See **ARCHITECTURE**.

DOR, the common black beetle. See **SCARABÆUS**.

DORADO, in ichthyology. See **CORYPHENA**.

DORADO, in astronomy, a southern constellation, not visible in our latitude; it is also called *xiphias*. The stars of this constellation, in Sharp's catalogue, are six.

DORENA, a genus of the monogynia order, and pentandria class of plants. Corolla five-cleft; stigma emarginate: capsule one-celled. One species, viz. *D. japonica*, a native of Japan.

DORAN, a town of Arabia, in the country of Yemen, 28 miles S. of Sana. Lon. 44. 4. E. Lat. 14. 55. N.

DORAT, a town of France in the department of Upper Vienne, 24 miles N. of Limoges.

DORCAS. See **CAPRA**.

DORCHESTER, the capital of Dorsetshire, seated on the river Frome, on a Roman road, 35 miles E. of Exeter. Lon. 2. 45. W. Lat. 50. 42. N.

DORCHESTER, a town in Oxfordshire, 10 miles S. E. of Oxford. Lon. 1. 0. W. Lat. 51. 39. N.

DORCHESTER, a county of Maryland, in North America.

DORCHESTER NECK, a peninsula of Massachusetts, in Norfolk county.

DORDOGNE, a department of France, comprehending part of the late province of Perigord, bounded on the N. E. by that of the Upper Vienne, on the E. by those of the Lot and Correze, on the S. by that of the Lot and Garonne, on the W. by those of the Gironde and the Lower Charente, and on the N. W. by that of the Charente. Perigueux is the capital.

DORDOGNE, a river of France, which rises about 7 miles N. W. of Besse, and joins the Garonne, near Bourdeaux.

DORDRECHT, or **DORT**. See **DORT**.

DORE, a river of France, which rises in the department of the Puy-de-dome, and joins the Allier.

DORIC DIALECT, one of the five dialects, or manners of speaking, which obtained among the Greeks. It was first used by the Lacedemonians, and particularly those of Argos; thence it passed into Epirus, Libya, Sicily, the islands of Rhodes and Crete. In this dialect, Archimedes and Theocritus wrote, who were both of Syracuse; as well as Pindar. The Doric dialect is properly the manner of speaking peculiar to the Dorians, after their recess near Parnassus and Asopus; and which afterwards came to obtain among the Lacedemonians, &c. Most of the medals of the cities of Græcia Magna, and Sicily, favour of the Doric dialect in their inscription: e. g. *ΑΜΒΡΑΚΙΝΤΑΝ, ΑΙΟΛΑΩΝΙΑΤΑΝ, ΑΧΕΡΟΝΤΑΝ, ΑΧΥΡΙΑΝ, ΗΡΑΚΛΕΩΝΤΑΝ, ΤΡΑΧΙΝΙΩΝ, ΘΕΡΜΙΤΑΝ, ΚΑΤΑΟΝΙΑΤΑΝ, ΚΟΗΙΑΤΑΝ, ΤΑΤΜΟΝΙΑΤΑΝ, &c.* Which shews the countries wherein the Doric dialect was used. According to the Doric dialect, the vowels *η, ε, ι, ω*, are changed in *α*; the diphthong *ηι* into *α* or *αι*; and the consonants *β* into *γ*; *ζ* into *σδ*; *κ* and *ς* into *τ*; *τ* and *ς* into *κ*; *λ* with a *τ* or *ς* following it, into *ν*. Thus for *σητης, τρεχων, κλειδας, βασιλευς, &c.* they say *φατης, τρεχω, κλειδας, γλυφαρας, &c.* They likewise change *υ* into *ω*, as *λογω* for *λογυ*; also *εις* into *εις*, as *βασιλευς* for *βασιλεις*; *οι*, *αι*, and *οι* into *η*, as *κρης* for *κρας*, *εγεις* for *εγαιεις*, and *γεις* for *γταιεις*; with other transmutations of the like nature.

DORIC MODE, in music, the first of the authentic modes of the ancients. Its character is to be severe, tempered with gravity and joy; and is proper upon religious occasions, as also to be used

n war. It begins D, lá, sol, re. Plato admires the music of the Doric mode, and judges it proper to preserve good manners as being masculine; and on this account allows it in his commonwealth. The ancients had likewise their subdoric or hypodoric mode, which was one of the plagal modes. Its character was to be very grave and solemn: it began with re, a fourth lower than the Doric.

DORIC ORDER, the second of the five orders of architecture. It is usually placed upon the Attic base, though originally it had none. See **ARCHITECTURE**. At its first invention it was more simple than at present; and when in aftertimes they came to adorn and enrich it more, the appellation Doric was restrained to this richer manner, and the primitive simple manner they called by a new name, the Tuscan order, which was chiefly used in temples; as the former, being more light and delicate, was for porticoes and theatres.

DORIS, in ancient geography, a country of Greece, between Phocis, Thessaly, and Acarnania. It received its name from Dorus the son of Deucalion, who made a settlement there. It was called Tetrapolis, from its four cities, viz. Pindus or Dryopis, Erineum, Cytinium, and Borium. To these four some add Lilæum and Carphía, and therefore call it Hexapolis. The name of Doris has been common to many parts of Greece.

DORIS, in entomology, a genus of the class and order vermes testacea. Body oblong, flat beneath, creeping; mouth placed below; vent behind surrounded with a fringe; feelers two, retractile. There are twenty-four species.

D. ARGO, the **LEMON DORIS**, has an oval body, convex, marked with numerous punctures, of a lemon colour; the vent beset with elegant ramifications. It inhabits different parts of our seas, and is called about Brighthelmstone the sea lemon.

DORIS, in the mythology, the daughter of Oceanus and Tethys, wife of Nereus and mother of the Nereides.

DORMANT, in heraldry, is used for the posture of a lion, or any other beast, lying along in a sleeping attitude with the head on the fore paws; by which it is distinguished from the couchant, where though the beast is lying, yet he holds up his head.

DORMER, in architecture, signifies a window made in the roof of a house, or above the entablature, being raised upon the rafters.

DORMITORY, a gallery in convents or religious houses, divided into several cells, in which the religious sleep or lodge.

DORMITORY is sometimes used for a burying-place.

DORMOUSE. See **MYOXUS**.

DORNBERG, a town of Germany, in the Upper Rhine, and principality of Hesse, eight miles N. N. W. of Darmstadt.

DORNBURG, a town of Germany, in Upper Saxony, and principality of Weimar, 14 miles E. of Weimar.

DORNOCH, the county town of Sutherland, on the Frith of Dornoch in Scotland.

DORBERNIA, the Roman name of Canterbury.

DOROBOL, or **DOROHOL**, a town of European Turkey, in Moldavia, 68 miles N. W. of Jassi, and 142 N. W. of Bender.

DORONICUM, **LEOPARD'S BANE**: a genus of the polygamia superflua order, and syngenesia class of plants; natural order, **Compositæ**. Receptacle naked; pappus simple; scales of the calyx in a double row, longer than the disc; seeds of the radius naked without any pappus. It has three species natives of Spain, France, and Germany.

DORPT, a town of Russia, in Liyonia, 60 miles S. of Narva. Lon. 27. 52. E. Lat. 58. 18. N.

DORSETSHIRE, a county of England, bounded on the N. by Somersetshire and Wiltshire, on the E. by Hampshire, on the S. by the English channel, and on the W. by Devonshire. It is for the most part hilly: the soil is in general shallow, over a chalky bottom, but in some of the valleys very rich; the whole is estimated at 775,000 acres. The number of sheep kept in this country is averaged at upwards of 800,000. The chief towns are Dorchester, Lyme, Shaftesbury, Pool, Bridport, Wareham, Corf Castle, Weymouth, Melcomb Regis, Sherborn, Blandford, Cranborn, Bemister, Abbotsbury, Bere, Evershot, Milton Abbey, Frampton, Stalbridge, Sturminster, Cerne, and Winburn; of which the first nine are borough towns, and send each two members to parliament. The principal rivers are the Stour, the Frome, and the Piddle. The climate is mild and healthy.

DORSTEN, a town of Germany, in the circle of the Lower Rhine, 31 miles S. W. of Munster.

DORSTENIA, **CONTRAYERVA**, a genus of the monogynia order, and tetrandria class of plants; natural order, **Scabridæ**. Receptacle common, monophyllous, fleshy; seeds lying singly in the fleshy substance. There are eight species, low herbaceous plants; growing in the warm countries of America. See **PLATE XXXV.**

DORSUM, the **BACK**, in anatomy, comprehends all the posterior parts of the body from the neck to the buttocks. See **ANATOMY**.

DORT, or **DORDRECHT**, a city of Holland, in the department of Delft, and late province of Holland, ten miles S. E. of Rotterdam. Lon. 4. 48. E. Lat. 51. 50. N.

DORT, **SYNOD OF**, a national synod, summoned by authority of the States General, the provinces of Holland, Utrecht, and Overysel excepted, and held at Dort in 1618. The most eminent divines of the United Provinces, and deputies from the churches of England, Scotland, Switzerland, Bremen, Hussia, and the Palatinate, assembled on this occasion, in order to decide the controversy between the Gomarists or Calvinists, and Arminians: the latter were declared corrupters of the true religion. But the authority of this synod was far from being universally acknowledged either in Holland or in England. The provinces of Friesland, Zealand, Utrecht, Guelderland, and Groningen, could not be persuaded to adopt their decisions: and they were opposed by king James I. and archbishop Laud in England. The liberty of private judgement with respect to the doctrines of predestination and grace, which the spirit that prevailed among the divines of Dort seemed so much adapted to discourage and suppress, acquired new vigour in consequence of the arbitrary proceedings of this assembly.

DORTMUND, a city of Germany, in Westphalia, 35 miles N. E. of Cologne. Lon. 7. 35. E. Lat. 51. 26. N.

DORYPHORI, [from *dory*, a spear, and *phor*, to bear,] an appellation given to the life-guard men of the Roman emperors.

DOSE, [*δοσις*,] so much of any medicine as is taken at one time.

DOSITHEANS, or **DOSITHEI**, an ancient sect among the Samaritans in the first century. They were named after their leader, Dositheus, mentioned by Origen, Epiphanius, Jerom, and other Greek and Latin fathers: But the learned are not at all agreed as to the time wherein he lived. St. Jerom, in his Dialogue against the Luciferians, places him before our Saviour; wherein he is followed by Drusius, who in his answer to Serrarius places him about the time of Sennacherib king of Assyria. But Scaliger will have him posterior to our Saviour's time: And Origen intimates him to have been contemporary with the apostles; where he observes, that he endeavoured to persuade the Samaritans that he was the Messiah foretold by Moses. He had many followers; and his sect was still subsisting at Alexandria in the time of the Patriarch Eulogius, as appears from a decree of that patriarch published by Phocius. In that decree Eulogius accuses Dositheus of injuriously treating the ancient patriarchs and prophets, and attributing to himself the spirit of prophecy. He makes him contemporary with Simon Magus; and accuses him of corrupting the Pentateuch in divers places, and of composing several books directly contrary to the law of God. Archbishop Ussher takes Dositheus to have been the author of all the changes made in the Samaritan Pentateuch, which he argues from the authority of Eulogius. But all we can justly gather from the testimony of Eulogius is, that Dositheus corrupted the Samaritan copies since used by that sect; but that corruption did not pass into all the copies of the Samaritan Pentateuch now in use among us, many of which vary but little from the Jewish Pentateuch.

DOTHAN, in ancient geography, a city twelve miles N. of Samaria, 44 of Jerusalem, and six W. of Tiberias; where Joseph was sold to the Ishmaelites, and where Elisha struck the Syrians blind.

DOTTEREL, a bird. See **CHARADRIUS**.

DOUARNENEZ, a sea-port town of France, in the department of Finisterre, 10½ miles N. W. of Quimper.

DOUAY, a considerable town of France, in the department of the North, and late French Flanders, 15 miles N. W. of Cambray. Lon. 3. 10. E. Lat. 50. 22. N.

DOUBLE CAST, in husbandry, a term used by the farmers for that method of sowing that does not dispense the necessary quantity

tity of seed for a piece of land at one bout, but requires going over every place twice.

DOUBLE FICHE', or **DOUBLE FICHY,** in heraldry, the denomination of a cross, when the extremity has two points; in contradistinction to *fiché*, where the extremity is shaped away to one point.

DOUBLE LETTER, in grammar, a letter which has the force and effect of two. The Greeks have three of these, viz. α , β , γ ; the Latins have two X and Z ; and most of the modern languages have the same.

DOUBLE POINT, in geometry, is one point considered as two infinitely near ones, belonging to geometrical curve lines.

DOUBLE OCTAVE, in music, an interval composed of 15 notes in diatonic progression, and which, for that reason, is called a fifteenth. "It is (says Rousseau) an interval composed of two octaves, called by the Greeks *disdiapason*." It deserves, however, to be remarked, that in intervals less distant and compounded, as in the third, the fifth, the simple octave, &c. the lowest and highest extremes are included in the number from whence the interval takes its name. But, in the double octave, when termed a fifteenth, the simple number of which it is composed gives the name. This is by no means analogical, and may occasion some confusion. We should rather choose, therefore, to run any hazard which might occur from uniformly including all the terms of which the component intervals consist, and call the double octave a sixteenth, according to the general analogy.

DOUBLE EMPLOYMENT, in music, a name given by M. Rameau to the two different manners in which the chord of the subdominant may be regarded and treated, viz. as the fundamental chord of the sixth superadded, or as the chord of the great sixth, inverted from a fundamental chord of the seventh. In reality, the chords carry exactly the same notes, are figured in the same manner, are employed upon the same chord of the tone, in such a manner, that frequently we cannot discern which of the two chords the author employs, but by the assistance of the subsequent chord, which resolves it, and which is different in these different cases. To make this distinction, we must consider the diatonic progress of the two notes which form the fifth and the sixth, and which, constituting between them the interval of a second, must one or the other constitute the dissonance of the chord. Now, this progress is determined by the motion of the bass. Of these two notes, then, if the superior be the dissonance, it will rise by one gradation into the subsequent chord, the lower note will keep its place, and the higher note will be a superadded sixth. If the lower be the dissonance, it will descend into the subsequent chord, the higher will remain in its place, and the chord will be that of the great sixth.

DOUBLE PLEA, [*duplex placitum*, Lat.] is that in which the defendant alleges for himself two several matters, in bar of the action, whereof either is sufficient to effect his desire in debarring the plaintiff.

DOUBLE-QUARREL, is a complaint made by any clerk or other to the archbishop of the province, against an inferior ordinary, for delaying justice in some cause ecclesiastical. The effect is, that the archbishop directs his letters, under the authentical seal, to all clerks of his province, commanding them to admonish the said ordinary within nine days to do the justice required, or otherwise to cite him to appear before him or his official: and lastly to intimate to the said ordinary, that if he neither performs the thing enjoined, nor appears at the day assigned, he himself will proceed to perform the justice required. And this seems to be termed a double-quarrel, because it is most commonly made against both the judge, and him at whose petition justice is delayed.

DOUBLET, among lapidaries, implies a counterfeit stone composed of two pieces of crystal, and sometimes glass softened, together with proper colours between them: so that they make the same appearance to the eye as if the whole substance of the crystal had been tinged with these colours. See **GLASS**, **COLOURING OF**.

DOUBLETS, a game on dice within tables.

DOUBLING, among hunters, is applied to a hare, which is said to double, when she keeps in plain fields, and winds about to deceive the hounds.

DOUBLING, in the manege, a term used of a horse, who is said to double his reins, when he leaps several times together, to throw his rider.

DOUBLING, in the military art, is the putting two ranks or files of soldiers into one. Thus, when the word of command is, *double* your ranks, the second, fourth, and sixth ranks march into the first, third, and fifth, so that the six ranks are reduced to three, and the intervals between the ranks become double what they were before.

DOUBLING UPON, in naval tactics, the act of inclosing any part of a hostile fleet between two fires, or of cannonading it on both sides. It is usually performed by the van or rear of that fleet which is superior in number, taking the advantage of the wind, or other circumstances, and tacking or veering round the van or rear of the enemy, who will thereby be exposed to great danger, and can scarcely avoid being thrown into general confusion.

DOUBLING A CAPE OR POINT, in navigation, signifies the coming up with it, passing by it, and leaving it behind the ship.

DOUBLINGS, in heraldry, the linings of robes and mantles of state, or of the mantlings in achievements.

DOUBE, a department of France, bounded on the E. by the Helvetic republic. It comprehends part of the late province of Franche Comté. Besançon is the capital.

DOUBS, or **DOUX,** a river of France, which rises at the foot of Mount Jura, and runs into the Saone, near Verdun.

DOUBTING, the act of with-holding our assent from any proposition, on suspicion that we are not able peremptorily to decide between the reasons for and against it. Doubting is distinguished by the schoolmen into two kinds, *dubitatio sterilis*, and *dubitatio efficax*. The former is that where no determination ensues: in this manner the Sceptics and Academics doubt, who with-hold their assent from every thing. See **SCEPTICS**, &c. The latter is followed by judgement, which distinguishes truth from falsehood: such is the doubting of the Peripatetics and Cartesians. The last in particular perpetually inculcate the deceitfulness of our senses, and tell us that we are to doubt of every one of their reports, till they have been examined and confirmed by reason. On the other hand, the Epicureans teach, that our senses always tell truth; and that, if we go ever so little from them, we come within the province of doubting.

DOUBTING, in rhetoric, a figure whereon the orator appears some time fluctuating, and undetermined what to do or say. Tacitus furnishes us with an instance of doubting, almost to a degree of distraction, in those words of Tiberius written to the senate: *Quid scribam, P. S. aut quomodo scribam, aut quid omnino non scribam hoc tempore, dii me deique pejus perdant quam perire quotidie sentio, si scio.*

DOUCINE, in architecture, a moulding concave above and convex below, serving commonly as a cymatium to a delicate cornice. It is likewise called *gula* and *cymatium*.

DOUE, a town of France, in the department of Maine and Loire, 20 miles S. of Angers.

DOVE, a river in Derbyshire, which falls into the Trent, 4 miles N. of Burton.

DOVE, in ornithology. See **COLUMBA**.

DOVER, a borough and sea-port town of England, in Kent. The cliffs, which are very high, afford a fine prospect of the French coast. Dover lies 15 miles S. of Canterbury, 21 miles N. of Calais, and 72 S. E. of London. Lon. 1. 23. E. Lat. 51. 8. N.

DOVER, a town and township of the United States, in Stafford county, New Hampshire.

DOVER, the metropolis of Delaware state, in Kent county, on the S. W. side of Jones creek, 76 miles S. S. W. of Philadelphia.

DOVER, STRAITS OF, the narrow channel between Dover and Calais, which separates Great Britain from the French coast. Britain is supposed by many to have been once peninsulated, the present straits occupying the site of the isthmus which joined it to Gaul. "No certain cause (says Mr. Pennant, in his *Arct. Zool.* vol. i. *Introd.* p. ii.) can be given for the mighty convulsion which tore us from this continent; whether it was rent by an earthquake, or whether it was worn through by the continual dashing of the waters." "The correspondency of strata, (he adds) on part of the opposite shores of Britain and France, leaves no room to doubt but that they were once united. The chalky cliffs of Blancnez between Calais and Boulogne, and those to the westward of Dover, exactly tally; the last are vast and continued; the former short, and

and the termination of the immense bed. Between Boulogne and Folkstone (about six miles from the latter) is another memorial of the junction of the two countries; a narrow submarine hill, called the Rip-raps, about a quarter of a mile broad, and ten miles long, extending eastwards towards the Goodwin Sands. Its materials are boulder stones, adventitious to many strata. The depth of water on it, in very low spring tides, is only 14 feet. The fishermen from Folkstone have often touched it with a 15 feet oar; so that it is justly the dread of navigators. Many a tall ship has perished on it, and sunk instantly into twenty-one fathoms of water. In July 1782, the *Belleisle* of 64 guns struck, and lay on it during three hours; but, by starting her beer and water, got clear off." These celebrated straits are only 21 miles wide in the narrowest part. From the pier at Dover to that of Calais 24. It is said that their breadth is diminishing, and that they are two miles narrower than they were in ancient times.

DOVE-TAILING, in carpentry, is the manner of fastening boards together by fitting one piece into another, in the form of the tail of a dove. The dove-tail is the strongest of the assemblages or jointings, because the tenon, or piece of wood which is put into the other, goes widening to the extreme, so that it cannot be drawn out again because the extreme or tip is bigger than the hole.

DOUGLAS, the capital of the Isle of Man, seated on the eastern side. Lon. 4. 25. W. Lat. 54. 7. N.

DOUGLASSIA, in botany, a genus of the polyadelphia polyandria class and order. Calyx half six-cleft, corolla none; nectary six; filaments none; germ superior; stigma six-cleft; berry ovate, one-celled; seed one, with a brittle shell. It has but one species, viz. *D. guianensis*, *guiana douglassia*.

DOULEIA, [*δουλειά*], in antiquity, a punishment among the Athenians, by which the criminal was reduced to the condition of a slave. It was never inflicted upon any but the *ατιμοι*, sojourners and freed servants.

DOULENS, or **DOURLENS**, a town of France, in the department of Somme, and late province of Picardy, 15 miles N. of Amiens. Lon. 2. 23. E. Lat. 50. 10. N.

DOURAK, a town of Persia, near the confluence of the Euphrates and Tigris; remarkable for the reeds of which the Persians make their pens. Lon. 56. 57. E. Lat. 32. 15. N.

DOURDAN, a town of France, in the department of Seine and Oise, and late province of the Isle of France, 25 miles S. W. of Paris.

DOURLACH, a town of Germany, in Suabia, 12 miles S. of Philipsburgh. Lon. 9. 28. E. Lat. 49. 2. N.

DOURO, or **DOUERO**, a river of Spain, which rises in Old Castile, in the Sierra of Urbion, and after crossing Portugal, falls into the Atlantic near Oporto.

DOUSE, in sea language, is to lower suddenly, or slacken; and it is applied to a sail in a squall of wind, an extended hawser, &c.

DOUW, **GERHARD**, a celebrated painter, born at Leyden in 1613. He received his first instructions from Bartholomew Doendo, an engraver, and Peter Kouwohoorn a painter on glass; but at the age of 15 he became a disciple of Rembrandt. His pictures are usually of a small size, with figures so exquisitely touched, so transparent, so wonderfully delicate, as to excite astonishment as well as pleasure. He designed every object after nature, and with an exactness so singular, that each figure appears as perfect as nature itself, in respect to colour, freshness, and force. It is incredible what vast sums have been and still are given for his paintings. He was exceedingly curious in finishing them, and patiently assiduous beyond example. Of that patience Sandrart gives a strong instance. Having once, in company with Bamboccio, visited Douw, they could not forbear admiring the prodigious neatness of a picture which he was then painting, in which they took particular notice of a broom; and expressing their surprise at the excessive neatness of the finishing that minute object, Douw told them he should spend three days more on that broom before he should account it complete. In a family picture of Mrs. Spiering, the same author says, that the lady had sat five days for the finishing one of her hands that leaned on an armed-chair. Few, therefore, would sit to him for their portraits; so he indulged himself mostly in works of fancy, in which he could introduce objects of still life, and employ as much time on them as suited his incli-

nation. Houbraken testifies, that his great patron Mr. Spiering allowed him 1000 guilders a year, and Sandrart assures us, that this pension was paid him on no other consideration, than that he should give his benefactor the option of every picture he painted, for which he was immediately to receive the utmost of his demand. Douw died in 1674, aged 61. He is doubtless the most wonderful in his finishing of all the Flemish masters. His colouring has exactly the true and lovely tints of nature; and whatever pains he may have taken, there is no look of labour or stiffness. His pictures are also remarkable, not only for retaining their original lustre, but for having the same beautiful effect at any distance.

DOWAGER, is a title applied chiefly, if not solely, to the widows of princes, dukes, earls, and persons of high rank. See **QUEEN DOWAGER**.

DOWER, [*Dotarium*, *Doarium*, or *Dos*], in law, a portion of lands or tenements which a widow enjoys for term of life from her husband, in case she survives him: and which, at her death, descends to their children. See **JOINTURE**.

DOWLAS HEAD, a cape of Ireland, on the coast of Kerry in Munster.

DOWLATABAD, or **DOWLET-ABAD**, a province in the Deccan of Hindostan, formerly called Amednagur, bounded on the N. by Candeish and Malwa; on the W. by the Balagat mountains; on the S. by Visiapour and Golconda, and on the E. by Berar. It is also called Balagat. Aurundabad is the chief city.

DOWLATABAD, **DOWLET-ABAD**, or **AMEDNAGUR**, a town and fort in the above province, 15 miles from Aurungabad. Lon. 76. 0. E. Lat. 19. 55. N.

DOWN, in commerce, the fine feathers from the breasts of several birds, particularly of the duck kind. That of the eider duck, see **ANAS**, is the most valuable. Three pounds of this down may be compressed into a space scarce bigger than one's fist; yet is afterwards so dilatable as to fill a quilt five feet square. (*Salern. Orn. p. 416.*)

DOWN, in geography, a county of Ireland in the province of Ulster, bounded on the E. and S. by the Irish sea; on the W. by the county of Armagh; and on the N. by that of Antrim. It lies opposite to the Isle of Man, Cumberland, and Westmoreland; and the N. part of it fronts the Mull of Galloway in Scotland, and is about 44 miles from it.

DOWN, or **DOWN-PATRICK**, the capital of the above county, one of the most ancient in that kingdom. It is 74 miles N. E. of Dublin. Lon. 5. 50. W. Lat. 54. 23. N.

DOWNHAM, a town of Norfolk, 35 miles N. E. of Cambridge.

DOWNINGS, a town of Pennsylvania, in Chester county, 33 miles W. by N. of Philadelphia.

DOWNS, [from *Dune*, Fr. of *Dun*, Celt. a mountain,] a bank or elevation of sand, which the sea gathers and forms along its shores; and which serves it as a barrier.

Downs, a famous road for ships, extending six miles along the E. coast of Kent, between N. and S. Foreland; where both the outward and homeward-bound ships frequently make some stay; and squadrons of men of war rendezvous in time of war. It affords excellent anchorage; and is defended by the castles of Deal, Dover, and Sandwich, as well as by Goodwin Sands.

DOWNTON, or **DUNKTON**, an ancient borough in Wiltshire, 84 miles W. S. W. of London.

DOWRY, [*dos*], is properly the money or fortune which the wife brings her husband in marriage: it is otherwise called *maritimum*, marriage-goods, and differs from dower. See **DOWER**. Among the Germans it was customary, in former times for the husband to bring a dowry to his wife.

Dowry is also used, in a monastic sense, for a sum of money given along with a maid, upon entering her in some religious order.

DOXOLOGY, [*δοξα* and *λογος*], a form of giving glory to God.

Doxology, a hymn used in praise of the Almighty, distinguished by the title of greater and less. Both the doxologies have a place in the church of England, the former being repeated after every psalm, and the latter used in the communion service.

1. **DOXOLOGY, THE GREATER**, or the angelic hymn, was of great

great note in the ancient church. It began with these words, which the angels sung at our Saviour's birth, Glory be to God on High, &c. It was chiefly used in communion service, and in private devotions.

2. **DOXOLOGY, THE LESS**, was anciently only a single sentence, without response, running in these words, 'Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen.' Part of the latter clause, 'As it was in the beginning, is now, and ever shall be,' was inserted some time after the first composition.

DRABA, a genus of the siliculosa order, and tetradynamia class of plants; natural order, Siliquosa. Silicula entire, oval oblong; valves a little plain, parallel to the partition; no style. There are nine species.

DRABLER, in the sea language, a small sail in a ship, which is the same to a bonnet, that a bonnet is to a course, and is only used when the course and bonnet are too shoal to clothe the mast.

DRABLING, in angling, is a method of catching barbel. Take a large line of six yards; which, before fastening it to the rod, must be put through a piece of lead, that if the fish bite, it may slip to and fro, and that the water may something move it on the ground; bait with a lobe worm well secured, and so by its motion the barbel will be enticed into the danger without suspicion. The best places are in running water near piles, or under wooden bridges, supported with oaks floated and slimy.

DRABS, in the salt-works, a kind of wooden boxes for holding the salt when taken out of the boiling pan; the bottoms of which are made shelving or inclining forwards, that the briny moisture of the salt may drain off.

DRAC, an imaginary being, formerly much dreaded by the country people in many parts of France. The dracs were supposed to be malicious or at least tricksome demons; but which was very rare, if one of them happened to take a fancy to a man or woman, they were sure to be the better for it.

DRACENA, a genus of the monogynia order, and hexandria class of plants. Corolla sexpartite, erect; filaments a little thicker about the middle; berry trilobular, monospermous. It has nine species, natives of the East Indies.

DRACHM, a Grecian coin, of the value of $\frac{73}{4}$ d. Drachm is also a weight used by our physicians; containing just sixty grains, three scruples, or the eighth part of an ounce. See COIN.

DRACO, a celebrated lawgiver of Athens. When archon, he made a code of laws for his fellow citizens, wherein all crimes were made capital; and even idleness was punished with death as well as murder. These laws were at first enforced, but they were afterwards neglected on account of their extreme severity; and Solon totally abolished them, except that one which punished a murderer with death. The respect of Draco's admirers proved fatal to him. When at Ægina, he appeared on the theatre, he was received with repeated applause; but the people, according to the custom of the Athenians, shewing their respect by throwing their garments upon him, they did it in such profusion, that Draco was soon hid under them, and smothered. He lived about B. C. 624.

DRACO, a constellation. See ASTRONOMY.

DRACO, the **DRAGON**, in zoology, a genus of the class and order amphibia reptilia; legs four; tail cylindrical; wings two, membranaceous, radiated like the fins of a fish, by which he is enabled to fly, but not to any great distance at a time. There are two species, both harmless creatures, feeding on flies, ants, and small insects, viz.

1. **DRACO PRÆPOS**, with the wings fixed to the fore-legs. It is a native of America.

2. **DRACO VOLANS**, the **FLYING DRAGON**, with the wings entirely distinct from the fore-legs. It is found in America and the East Indies. See Plate LIV. fig. 14.

DRACO VOLANS, in meteorology, a fiery exhalation, frequent in marshy and cold countries. It is most common in summer; and though principally seen playing near the banks of rivers, or in boggy places, yet sometimes mounts up to a considerable height in the air: its appearance being that of an oblong, sometimes roundish, fiery body, with a long tail. It is entirely harmless.

DRACOCEPHALUM, **DRAGON'S HEAD**, a genus of the gymnospermia order, and didynamia class of plants. Corolla throat inflated, upper lip concave. There are fifteen species, most of them herbaceous, annual or perennial plants, from 18

inches to 3 feet high, garnished mostly with entire leaves, and whorled spikes of small monopetalous and ringent flowers, of a blue, white, or purple colour.

DRACONARIUS, [*Δρακοναριος* and *Δρακονοειδης*,] in antiquity, dragon-bearer. The Persians, Parthians, Scythians, &c. bore dragons on their standards; whence the standards themselves were called Dracones.

DRACONES, among the Romans, were figures of dragons painted in red on their flags, as appears from Ammianus Marcellinus; but among the Persians and Parthians they were like the Roman eagles, figures in full relieve; so that the Romans were frequently deceived, and took them for real dragons.

DRACONTIC MONTH, the time of one revolution of the moon from her ascending node, called *caput draconis*, to her return thither.

DRACONTIUM, **DRAGONS**; a genus of the polyandria order, and gynandria class of plants; natural order, Pipérac. Spathia cymbiform, or shaped like a boat; spadix covered all over; no calyx; petals five; berries polyspermous. There are five species, all natives of the Indies.

DRACUNCULI, in medicine, small long worms which breed in the muscular part of the arms and legs, called Guinea worms. The common way of getting out these worms is by the point of a needle; and to prevent their forming again, to wash the parts with wine, vinegar, alum, nitre, or common salt, or with a strong lixivium, of oak-ashes, and afterwards anointing them with an ointment of the common kind used for scorbutic eruptions, with a small mixture of quicksilver.

DRAG, in sea language, is a machine consisting of a sharp, square, iron ring, encircled with a net, and commonly used to take the wheel off from the platform or bottom of the decks. The word is also used for whatever hangs over the ship in the sea, as shirts, coats, or the like; boats, when towed, or whatever else may retard the ship's way when she sails.

DRAGOMAN, or **DROGMAN**, a term of general use through the East for an interpreter, whose office is to facilitate commerce between the orientals and occidentals.

DRAGON, [*draco*, Lat.] See DRACO.

DRAGON FLY. See LIBELLULA.

DRAGONE, in heraldry, where the upper half resembles a lion or other beast, the other half going off like the hinder part of a dragon.

DRAGONS, in botany. See ARUM, and DRACONTIUM.

DRAGONS-BLOOD, a gummi-resinous substance brought from the East-Indies, either in oval drops wrapped up in flag leaves, or in large masses composed of smaller tears. It is said to be obtained from the palmijuncus draco, the calamus rotang, the dracena draco, the pterocarpus draco, and several other vegetables. The writers on the materia medica prefer the former, though the others are often of equal goodness. The fine dragon's blood of either sort breaks smooth, free from any visible impurities, of a dark red colour, which changes upon being powdered into an elegant bright crimson. Several artificial compositions, coloured with the true dragon's blood, or Brazil wood, are sometimes sold for this commodity. A solution of dragon's blood in the spirit of wine is used for staining marble, to which it gives a red tinge, which penetrates more or less deeply according to the heat of the marble during the time of application. But as it spreads at the same time that it sinks deep, for fine designs the marble should be cold. Mr. Du-Fay says, that by adding pitch to this solution the colour may be rendered deeper.

DRAGONS HEAD AND TAIL, [*caput & cauda draconis*] in astronomy, are the nodes of the planets; or the two points wherein the ecliptic is intersected by the orbits of the planets, and particularly that of the moon; making with it angles of $5^{\circ} 18'$. The northern is called the ascending node, and the southern the descending node. These points have a retrograde motion in the zodiac, $3^{\circ} 11'$ per day; completing their circle in 18 years 225 days: so that the moon can be but twice in the ecliptic during her monthly period, but at all other times she will have a latitude or declination from the ecliptic. About these points of intersection all eclipses happen. They are usually denoted by these characters ♄ dragon's head, and ♆ dragon's tail; thus by ♄ ♄ $14^{\circ} 29' 59'' 59'' 17'''$ is meant that the moon's ascending node is in $14^{\circ} 29' 59'' 59'' 17'''$ of Capricorn, consequently the moon's ♆ is in ♄ $14^{\circ} 29' 59'' 59'' 17'''$.

DRAGOON, [from *dragen*, German, to carry] a kind of soldier that serves indifferently either on foot or horseback.

DRAGOONS are divided into brigades as the cavalry; and each regiment into troops; each troop having a captain, lieutenant, cornet, quarter-master, two serjeants, three corporals, and two drums. They are very useful on any expedition that requires dispatch; for they can keep pace with the cavalry, and do the duty of infantry: they encamp generally on the wings of the army, or at the passes leading to the camp; and sometimes they are brought to cower the general's quarters; they march in front and rear of the army. The first regiment of dragoons raised in England was in 1681, and called the regiment of dragoons of North Britain. In battles or attacks they generally fight sword in hand after the first fire. Their arms are, a sword, firelock, and bayonet.

DRAGOONING, one of the methods used by Papists for converting refractory heretics. The troopers, soldiers, and dragoons went into the Protestants' houses, where they marred and defaced their household stuff, broke their looking-glasses, and other utensils and ornaments, let their wine run about their cellars, and threw about their corn and spoiled it. Those things which they could not destroy in this manner, such as furniture of beds, linens, wearing apparel, plate, &c. they carried to the market-place, and sold them to the Jesuits and other Roman Catholics. By these means the Protestants in Montauban alone were, in four or five days, stripped of above a million of money. Besides this they exercised upon them the most horrid barbarities that can possibly be conceived.

DRAGUIGNAN, a town of France, in the department of Var. Lon. 6. 35. E. Lat. 43. 31. N.

DRAINS, and **DRAINING**. See **HUSBANDRY**.

DRAKE, in ornithology. See **ANAS**.

DRAKE, **SIR FRANCIS**, the renowned English admiral, was the son of Edmund Drake a sailor, and born near Tavistock in Devonshire, in 1545. He was brought up under the care of Sir John Hawkins, who was his kinsman. In 1570, he made his first expedition with two ships; and in 1571, with one only, in which he returned safe, if not with such advantages as he expected. He made another expedition in 1572, wherein he gained considerable booties. In these expeditions he was much assisted by a nation of Indians, who then were, and have been ever since, engaged in perpetual wars with the Spaniards. The prince of these people was named Pedro; to whom Drake presented a fine cutlass from his side, which he saw the Indian greatly admired. Pedro, in return, gave him four large wedges of gold: which Drake threw into the common stock, saying, That he thought it but just that such as bore the charge of so uncertain a voyage on his credit, should share the utmost advantage that voyage produced. His success in this expedition, joined to his honourable behaviour towards his owners, gained him a high reputation; and the use he made of his riches, a still greater. For, fitting out three stout frigates at his own expence, he sailed with them to Ireland; where under Walter earl of Essex, he served as a volunteer, and performed many exploits. Sir Christopher Hatton introduced him to Q. Elizabeth, to whom he proposed a voyage into the South Seas through the Straights of Magellan; which was what hitherto no Englishman had ever attempted. The project was well received at court: the queen furnished him with means; and his own fame quickly drew together a sufficient force. The fleet with which he sailed, on this extraordinary undertaking, consisted only of five vessels, small when compared with modern ships, and no more than 164 able men. He sailed on the 13th Dec. 1577; on the 25th fell in with the coast of Barbary, and on the 29th with cape Verd. On the 13th March he passed the equinoctial, made the coast of Brazil on the 5th April, and entered the River de la Plata, where he lost the company of two of his ships; but meeting them again, and taking out their provisions, he turned them adrift. On the 29th May he entered the port of St. Julian's, where he continued two months for the sake of laying in provisions: on the 20th Aug. he entered the Straits of Magellan, and on the 25th Sept. passed them, having then only his own ship. On the 25th Nov. he came to Machao, which he had appointed for a place of rendezvous in case his ships separated; but captain Winter, his vice-admiral, having repassed the Straits, was returned to England. Thence he continued his voyage along the coasts of Chili and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were sated with plunder; and

then, coasting America to the height of 48°, he endeavoured to find a passage that way back into our seas, but could not. However, he landed, and called the country New Albion, taking possession of it in the name of queen Elizabeth; and, having careened his ship, set sail from thence, on the 29th Sept. 1579, for the Moluccas. He is supposed to have chosen this passage round, partly to avoid being attacked by the Spaniards at a disadvantage, and partly from the lateness of the season, whence dangerous storms and hurricanes were dreaded. On the 13th Oct. he fell in with certain islands inhabited by the most barbarous people he had met with in all his voyage: on the 4th Nov. he had a sight of the Moluccas; and, coming to Ternate, was extremely well received by the king thereof, who appears, from the most authentic relations of this voyage, to have been a wise and polite prince. On the 10th Dec. he made Celebes; where his ship unfortunately ran upon a rock, the 9th Jan. following; from which, beyond all expectation, and almost miraculously, they got off, and continued their course. On the 16th March he arrived at Java Major; and on the 25th began to think of returning home. On the 15th June he doubled the Cape of Good Hope, having then on board 57 men, and but three casks of water. On the 12th July he passed the line, reached the coast of Guinea on the 16th, and there watered. On the 11th Sept. he made the island of Tercera; and on the 3d Nov. entered the harbour of Plymouth. This voyage round the world was performed in two years and about ten months. Shortly after his arrival, the queen going to Deptford, went on board his ship; where, after dinner, she conferred on him the order of knighthood, and declared her absolute approbation of all he had done. She likewise gave directions for the preservation of his ship, that it might remain a monument of his own and his country's glory. This celebrated ship, which had been contemplated many years at Deptford, at length decaying, it was broke up, and a chair, made out of the planks, was presented to the university of Oxford. In 1585, he sailed with a fleet to the West-Indies; and took the cities of St. Jago, St. Domingo, Carthagena, and St. Augustin. In 1588, he went to Lisbon with a fleet of 30 sail; and having intelligence of a great fleet assembled in the bay of Cadiz, which was to have made part of the armada, he with great courage entered that port, and burnt there upwards of 10,000 tons of shipping: which he afterwards merrily called burning the king of Spain's beard. In 1588, when the armada from Spain was approaching our coasts, Sir Francis Drake was appointed vice-admiral under Charles lord Howard of Effingham, high admiral of England, where fortune favoured him as remarkably as ever: for he made prize of a very large galleon, commanded by Don Pedro de Valdez, who was reputed the projector of this invasion; and who surrendered, as soon as he learned it was Drake who summoned him. This Don Pedro remained about two years Sir Francis Drake's prisoner in England; and, when he was released, paid him for his own and his captain's liberties, a ransom of 3500*l*. Drake's soldiers were well recompensed with the plunder of this ship; for they found in it 55,000 ducats of gold, which was divided among them. After this he went to the West-Indies with Sir John Hawkins, but the two commanders disagreeing in their plans, little was done by them. Drake died off Nombre de Dios in 1596. He was representative for the town of Plymouth, to which he was a great benefactor, by causing water to be conveyed to it from springs at eight miles distance.

DRAM, [from *drachm*, *drachma*, Latin,] the eighth part of an ounce.

DRAMA, [*δραμα*,] a poem accommodated to action; a poem in which the action is not related, but represented; and in which therefore such rules are to be observed as make the representation probable. The principal species of the drama are two, comedy and tragedy. Some others there are of less note, as pastoral, satire, tragi-comedy, opera, &c. See **POETRY**.

DRANK, among farmers, a term used to denote wild oats, which never fail to infest worn-out lands; so that when plowed lands run to these weeds and thistles, the farmer knows it is high time to fallow them, or else to sow them with hay-seed, and make pasture of them. Some, indeed, destroy the drank, by sowing the lands with beans, and letting loose sheep upon them when young. This must be done in dry weather, and the sheep eat up the drank and other weeds, without touching the beans.

DRAPERY, in sculpture and painting, signifies the representation of the clothing of human figures, and also hangings, tapestry, curtains,

curtains, and most other things that are not carnations or landscapes. See **DRAWING** and **PAINTING**.

DRASTIC, [δραστικόν,] in physic, an epithet bestowed on such medicines as are of present efficacy, and potent in operations; and is commonly applied to emetics and cathartics.

DRAVE, a large navigable river of Germany, which rises in the archbishopric of Salzburg, and falls into the Danube at Esseck.

DRAUGHT, in architecture, or as it is pronounced *Draft*, the figure of an intended building described on paper; wherein are laid down, by scale and compasses, the several divisions and partitions of the apartments, rooms, doors, passages, conveniences, &c. in their due proportion. It is exceedingly convenient, before a building is begun to be raised, to have draughts of the ichnography, or ground plot of each floor; as also of the form and fashion of each front, with the windows, doors, ornaments, &c. in an orthography, or upright. Sometimes the several fronts, &c. are taken, and represented in the same draught, to shew the effect of the whole building: this is called a scenography, or perspective.

DRAUGHT, in medicine. See **POTION**.

DRAUGHT, in trade, called also *Cloff* or *Clouch*, is a small allowance on weighable goods, made by the king to the importer, or by the seller to the buyer, that the weight may hold out when the goods are weighed again. The king allows 1 lb. draught for goods weighing no less than 1 Cwt. 2 lb. for goods weighing between 1 and 2 Cwt. 3 lb. for goods weighing between 2 and 3 Cwt. 4 lb. from 3 to 10 Cwt. 7 lb. from 10 to 18 Cwt. 9 lb. from 18 to 30 or upwards.

DRAUGHT is also used sometimes for a bill of exchange, and commonly for an order for the payment of any sum of money due, &c. The person who gives the order is said to draw upon the other.

DRAUGHT HOOKS, large hooks of iron, fixed on the cheeks of a cannon carriage, two on each side, one near the trunnion hole, and the other at the train, distinguished by the name of fore and hind. Large guns have draught hooks near the middle transom, to which are fixed the chains that serve to keep the shafts of the limbers on a march. The fore and hind hooks are used for drawing a gun backwards or forwards, by men with strong ropes, called draught ropes, fixed to these hooks.

DRAUGHT HORSE, in farming, a sort of coarse made horse, destined for the service of a cart or plough.

DRAUGHT, to draw off troops from the main army, or out of one regiment into another.

DRAW, in the sea-language, a ship is said to draw so much water, according to the number of feet she sinks into it; so that if a ship sinks into the water 18 feet perpendicularly, she is said to draw 18 feet water; and according as she draws more or less, she is said to be of more or less draught.

DRAWBACK, in commerce, certain duties, either of the customs or of the excise, allowed upon the exportation of some of our own manufactures; or upon certain foreign merchandise, that have paid duty on importation. The oaths of the merchants importing and exporting are required, to obtain the drawback on foreign goods, affirming the truth of the officers certificate on the entry, and the due payment of the duties: and these may be made by the agent or husband of any corporation or company; or by the known servant of any merchant usually employed in making his entries, and paying his customs. In regard to foreign goods entered outward, if less quantity or value be fraudulently shipped out than what is expressed in the exporter's certificate, the goods therein mentioned, or their value, are forfeited, and no drawback is allowed. Foreign goods exported by certificate in order to obtain the drawback, not shipped or exported, or re-landed in Great Britain, unless in case of distress to save them from perishing, lose the benefit of the drawback, and are forfeited, or their value, with the vessel, horses, carriages, &c. employed in the relanding thereof; and the persons employed in the relanding them, or by whose privity they are re-landed, or into whose hands they shall knowingly come, are to forfeit double the amount of the drawback. Officers of the customs conniving at or assisting in any fraud relating to certificate goods, besides other penalties, are to forfeit their office, and suffer six months imprisonment without bail or mainprize; as are also masters, or persons belonging to the ships employed therein. Bonds given for the exportation of certificate goods to Ireland must not be delivered up, nor drawback allowed for any goods, till a certificate under the hands and seals of the collector or comptroller, &c. of the customs be produced, testifying the landing.

DRAW-BRIDGE, a bridge made after the manner of a floor, to draw up, or let down, as occasion serves, before the gate of a town or castle. See **BRIDGE**. A Draw-bridge may be made after several different ways; but the most common are made with plyers, twice the length of the gate, and a foot in diameter. The inner square is traversed with a cross, which serves for a counterpoise: and the chains which hang from the extremities of the plyers to lift up or let down the bridge, are iron or brass. In navigable rivers it is sometimes necessary to make the middle arch of bridges with two moveable platforms, to be raised occasionally, in order to let the masts and rigging of ships pass through. This kind of draw-bridge is represented in Plate LIV, fig. 15, where AB is the width of the middle arch; AL and BL, the two piers that support the draw-bridge; one of the platforms of which is raised, and the other let down, having the beam PQ for its pleyer. From the platform are suspended two moveable braces EH, EF, which resting on the support E, press them against the braket M, and thereby strengthen the draw-bridge. These braces are conducted to the rest by means of the weight S, pulling the chain SLE.

DRAWING.

DRAWING is the art of justly representing the appearance of objects upon a plain surface, by means of lines, shades, and shadows, formed with certain colouring materials. This art is founded on a knowledge of geometry and perspective: the study of both is therefore the first step towards the attainment of the art of drawing. See **GEOMETRY** and **PERSPECTIVE**. Drawing has been cultivated from the earliest antiquity but for its history, see **PAINTING**.

I. OF MATERIALS AND INSTRUMENTS.

To acquire this elegant art, the learner must furnish himself with proper materials and instruments; such as black lead pencils, crayons of black, white, or red chalk, crow-quill pens, a rule and compasses, camels hair pencils, Indian ink, Indian rubber, drawing paper, drawing boards, &c. He must accustom himself to hold the pencil farther from the point than he does a pen in writing; which will give him a better command of it, and contribute to render the strokes more free and bold. The use of the pencil is to draw the

first outlines of the piece, as any stroke that is amiss may be easily rubbed out; and when he has made the sketch as correct as he can with the pencil, he may then draw carefully the best outline he has got, with his crow-quill pen and ink; after which he may discharge the pencil lines, by rubbing the piece gently with the crumb of stale bread or Indian rubber. The ink used for this purpose should be Indian ink; which is much softer than the common, and does not run. By mixing it with water, it may be made to any degree of strength, and used in a pen like common ink. Having got the outline clear, his next work is to shade the piece properly, either by drawing fine strokes with his pen where it requires to be shaded, or by washing it with his pencil and the Indian ink. As to his rule and compasses, they are very rarely to be used, except in measuring the proportions of figures after he has drawn them, to prove whether they be right or not; or in houses, fortifications and other pieces of architecture. The best kind of drawing-boards, are made with a frame and a moveable panel, upon which the paper is simply put wet, and then forced into the frame, where it is con-

finet

finied by wedges at the back. A ruler made in the form of the letter T will be convenient to use with the drawing boards for drawing parallel and perpendicular lines.

II. OF DRAWING LINES, SQUARES, CIRCLES, AND OTHER GEOMETRICAL FIGURES.

The first practice of a learner must be to draw straight and curve lines, with ease and freedom, upwards and downwards, sideways to the right or left, or in any direction whatsoever. He must also learn to draw by command of hand, squares, circles, ovals, and other geometrical figures: for as the alphabet, or a knowledge of the letters, is an introduction to grammar, so is geometry to drawing. The practice of drawing these simple figures till he is master of them, will enable him to imitate, with greater ease and accuracy, many things both in nature and art. Four general rules may here be laid down; 1. Never to be in a hurry; but to make himself perfectly master of one figure before he proceeds to another: the advantage, and even necessity, of this, will appear as he proceeds: 2. To accustom himself to draw all his figures very large, which is the only way of acquiring a free bold manner of designing: 3. To practise drawing till he has gained a tolerable command of his pencil, before he attempts to shade any figure or object of any kind whatever: And, 4. Not to finish perfectly at first any single part, but to sketch out faintly, with light strokes of the pencil, the shape and proportion of the whole figure; and afterwards to correct it where it is amiss.

III. OF DRAWING EYES, EARS, FLOWERS, FRUITS, BIRDS, BEASTS, LEGS, ARMS, HANDS, &c.

The learner may begin with drawing the outlines of eyes, ears, noses, &c. See Plate LX. He may next proceed with flowers, fruits, birds, beasts, and the like; not only as it will be a more pleasing employment, but as it is an easier task, than the drawing of hands and feet, and other parts of the human body, which require not only more care, but greater exactness and nicer judgement. Very few instructions are requisite upon this head; the best thing the learner can do, is to furnish himself with good prints or drawings, by way of examples, and with great care and exactness to copy them. If it is the figure of a beast, begin with the forehead, and draw the nose, the upper and under jaw, and stop at the throat. Then go to the top of the head, and form the ears, neck, and back; and continue the line till you have given the full shape of the buttock. Then form the breast, and mark out the legs and feet, and all the smaller parts. See Plate LXI. After which the figure is to be finished with the proper shadows. The learner may then proceed to the drawing of legs and arms, by copying carefully the examples given in Plate LX. but the actions and postures of the hands are so many and various, that no certain rules can be given for drawing them, that will universally hold good. Yet as the hands and feet are difficult to draw, it is very necessary to bestow some time and pains about them, carefully imitating their various postures and actions, so as not only to avoid all lameness and imperfection, but also to give them life and spirit. To arrive at this, great care, study, and practice, are requisite; particularly in imitating the best prints or drawings that can be got of hands and feet, examples of which are given in Plate LX; for, as to the mechanical rules of drawing them by lines and measures, they are not only perplexed and difficult, but also contrary to the practice of the best masters. And here the general rule abovementioned must be applied, viz. to sketch out faintly, with light strokes, the shape and proportion of the whole hand, with the action and turn of it; and after considering whether this first sketch be perfect, and altering it where it is amiss, to proceed to the bending of the joints, the knuckles, the veins, and other small particulars, which when the learner has got the whole shape and proportion of the hand or foot, will not only be more easily but also more perfectly designed.

IV. OF DELINEATING FACES.

The head is usually divided into 4 equal parts, viz. 1. From the crown of the head to the top of the forehead. 2. From the top of the forehead to the eye-brows. 3. From the eye-brows to the bottom of the nose. 4. From thence to the bottom of the chin. But this proportion is not constant; those features in different men being often very different as to length and shape. In a well-proportioned

face, however, they are nearly right. To direct the learner, therefore, in forming a perfect face, his first business is to draw an oval, or rather the form of an egg; in the middle of which, from the top to the bottom, draw a perpendicular line. Through the middle of this line draw a diameter-line, directly across from one side to the other of the oval. On these two lines all the features of the face are to be placed as follows: Divide the perpendicular line into four equal parts: the first must be allotted to the hair of the head; the second is from the top of the forehead to the top of the nose between the eye-brows; the third is from thence to the bottom of the nose; and the fourth includes the lips and chin. The diameter-line, or the breadth of the face, is always supposed to be the length of five eyes; it must therefore be divided into five equal parts, and the eyes placed upon it so as to leave exactly the length of one eye betwixt them. This is to be understood only of a full front face, Plate LX. for if it turn to either side, the distances are to be lessened on that side which turns from you, less or more in proportion to its turning. The top of the ear is to rise parallel to the eye-brows, at the end of the diameter-line; and the bottom of it must be equal to the bottom of the nose. The nostrils ought not to come out farther than the corner of the eye in any face; and the middle of the mouth must always be placed on the perpendicular line.

V. OF DRAWING HUMAN FIGURES.

When the learner is tolerably perfect in drawing faces, heads, hands, and feet, he may next attempt to draw the human figure at full length. In this performance he ought to attend with great care to the true proportions of the body and limbs, for which observe, that in a well-formed person, his arms extended make a distance between the extremities of the middle fingers equal to his length; that the face consists of three exact divisions, from the hair on the forehead to the eyes, from the eyes to the bottom of the nose, and from that to the chin. The whole figure is ten faces in length; from the chin to the collar-bone is twice the length of the nose, thence to the lowest part of the breast one face, from that to the navel another, to the groin one, to the upper part of the knee two, the knee is half a face in length, from the lower part of which to the ankle is two faces, and hence to the sole of the foot is one-half. Measuring from the extremes of the breast, the breadth will be found to contain two faces, and the bone of the arm from the shoulder to the elbow, the same number; thence, including part of the hand, two faces; and from the shoulder-blade to the hollow between the collar-bones, is one face. The thumb is the length of the nose; from the commencement of the hand to the middle of the arm is five lengths of the nose; and from the pectoral muscle to the same place is four. The great toe is of the length of the nose, and the sole of the foot is the sixth part of the length of the figure; the hands are double their breadth in length, and when extended they are exactly the length of the face. The breadth of the limbs vary according to the state of health in the body, and the particular situation of the muscles whenever moved. The length of the whole figure being divided into ten equal parts or faces, the points of division answering to the different parts of the body, will appear from the figure in Plate 61. No. 2, in which the divisions are marked and numbered. To draw a figure correctly, the intended length should be marked, and all the preceding measurements strictly adhered to, beginning the sketch with the head, following with the shoulders, the trunk, the leg most in action, then the other, finishing with the arms, and making the outline perfect before any part is finished; as we may imagine a living or plaster model placed before the student, that will serve better for improving him than any written instructions, but he will find the greatest difficulty in correctly copying the eyes, mouth, ears, hands, and feet, and should consequently be particularly careful when employed in those parts. Let the learner remember, in whatever he intends to draw, first to sketch its several parts, measuring the distances and proportions between each with his finger or pencil, without using the compasses; and then judging of them by the eye, which by degrees, will be able to judge of truth and proportion; and will become his best and principal guide. And let him observe, as a general rule, always to begin on the left hand, or the right side of the piece he is copying: for thus he will always have what he has done before his eyes; and the rest will follow more naturally, and with greater ease. All the bowings and bendings that are in the body, must be taken notice of, making the

part which is opposite to that which bends correspond to it in bending with it. For instance: if one side of the body bend in, the other must stand out answerably to it: if the back bend in, the belly must stick out; if the knee bend out, the ham must fall in; and so of any other joint of the body. In a word, the learner must endeavour to form all the parts of the figure with truth, and in just proportion: not one arm or one leg bigger or less than the other: not broad Herculean shoulders, with a thin and slender waist; nor raw and bony arms, with thick and gouty legs; but let there be a kind of harmonious agreement amongst the members, and a beautiful symmetry throughout the whole figure. The proportions of children are generally thus: three heads in length from the crown of the head to the groin, and thence to the sole of the foot two, one head and a half between the shoulders, one, of the body between the hips and armpits; the breadth of the limbs should be ascertained from a healthy child. It is a leading principle, in which every person conversant in designing has agreed, that without a perfect knowledge of the proportions, nothing can be produced but monstrous and extravagant figures; and it is also universally admitted, that the ancient Greek and Roman sculptors attained the highest success in producing the most perfect models. It is perhaps impossible to draw a perfectly beautiful figure from any one person: the most skilful statuary and painters, sensible of this fact, have composed their finest works from different subjects. Hence artists who have examined the subject with attention, have never found any man so perfect in all his parts as are some of the figures produced by the ancient sculptors.

VI. OF THE EFFECTS OF THE EXERTION OF THE MUSCLES.

The most obvious effects of the exertion of those muscles, which chiefly demand the attention of a painter, are the following: If either of the mastoid muscles act, the head is turned to the contrary side, and the muscle which performs that action appears very plain under the skin. If the arms are lifted up, the deltoid muscles placed on the shoulders, which perform that action, swell, and make the extremities of the spines of the shoulder-blades, called the tops of the shoulders, appear indented or hollow. The shoulder-blades following the elevation of the arms, their bases incline at that time obliquely downward. If the arms are drawn down, put forwards, or pulled backwards, the shoulder-blades necessarily vary their positions accordingly. When the cubitus or fore-arm is bended, the biceps has its belly very much raised, as appears in the left arm. The like may be observed of the triceps, when the arm is extended, as observed in the right arm. The straight muscles of the abdomen appear very strong when rising from a decumbent posture. Those parts of the great serratus muscle, which are received in the beginnings of the oblique descending muscle immediately below, are very much swelled when the shoulder on the same side is brought forwards; the serratus muscle then being in action in drawing the scapula forwards. The long extending muscles of the trunk act alternately in walking: if the right leg bears the weight of the body, and the left is in translation as on tiptoe, the last mentioned muscles of the back on the left side may be observed to be tumified on the other side about the region of the loins, and so on the other side. The trochanters, or outward and uppermost heads of the thigh-bones, vary in their positions in such a manner as no precise observations can explain their several appearances; but the study after the life ought to be carefully attended to. If the thigh is extended, as when the whole weight of the body rests on that side, the gluteus or buttock muscle makes a very different appearance from what it offers at another time; but if the thigh is drawn backwards, that muscle appears still more and more tumified. When the whole leg is drawn upwards forwards, and at the same time the foot is inclined inwards, the upper part of the sartorius muscle appears rising very strong; in other positions of the thigh, that muscle makes a furrowing appearance in its whole progress. If a man is upon tiptoe, the extending muscles of the leg placed on the fore-part of the thigh, and those of the foot that compose the calf of the leg, appear very strong, and the long peronæus makes a considerable indentation or furrowing at that time in its progress on the outside of the leg. Many other remarks might be made on this subject; but for a knowledge of these, and the foregoing, the painter ought to study anatomy, and consult with care different anatomical plates, in which the muscles are represented; to this must be add-

ed a due attention to nature which will supersede any further instruction on this head.

VII. OF THE EFFECTS OF THE PASSIONS IN GENERAL.

When the student of drawing has made himself acquainted with the various attitudes and muscular exertions of the human body, it will be proper for him next to study the effects of the passions upon the limbs and features. The passions, says M. Le Brun, are motions of the soul, either upon her pursuing what she judges to be for her good, or shunning what she thinks hurtful to her; and commonly, whatever causes emotion of passion in the soul, creates also some action in the body. It is therefore necessary for a painter to know which are the different actions in the body that express the several passions of the soul, and how to delineate them.

M. Le Brun has been extremely happy in expressing many of the passions, and the learner cannot study any thing better than the examples which he has left us of them; and of which we have given a copy in Plate LXII. However, as M. De Piles justly observes, it is absurd as well as impossible, to pretend to give such particular demonstrations of them, as to fix their expression to certain strokes, which the painter should be obliged to make use of, as essential and invariable rules. This, says he, would be depriving the art of that excellent variety of expression, which has no other principle than diversity of imagination, the number of which is infinite. The same passion may be finely expressed several ways, each yielding more or less pleasure in proportion to the painter's understanding, and the spectators discernment. Though every part of the face contributes towards expressing the sentiments of the heart, yet the eye-brow, according to M. Le Brun, is the principal seat of expression, and where the passions best make themselves known. It is certain, says he, that the pupil of the eye, by its fire and motion, very well shews the agitation of the soul, but then it does not express the kind or nature of such an agitation; whereas the motion of the eye-brow differs according as the passions change their nature. To express a simple passion, the motion is simple; to express a mixed passion, the motion is compound: if the passion be gentle, the motion is gentle; and if it be violent, the motion is so too. We may observe farther, says he, that there are two kinds of elevation in the eye-brows: one, in which the eye-brows rise up in the middle; this elevation expresses agreeable sensations, and it is to be observed that then the mouth rises at the corners: the other, in which the eye-brows rise up at the ends, and fall in the middle; this motion denotes bodily pain, and then the mouth falls at the corners. In laughter, all the parts agree; for the eye-brows, which fall toward the middle of the forehead, make the nose, the mouth, and the eyes, follow the same motion. In weeping, the motions are compound and contrary; for the eye-brows fall toward the nose and over the eyes, and the mouth rises that way. It is to be observed also, that the mouth is the part of the face which more particularly expresses the emotions of the heart: for when the heart complains, the mouth falls at the corners; when it is at ease, the corners of the mouth are elevated, and when it has an aversion, the mouth shoots forward, and rises in the middle. "The head (says M. De Piles) contributes more to the expression of the passions, than all the other parts of the body put together. Those separately can only shew some few passions, but the head expresses them all. Some, however, are more peculiarly expressed by it than others; humility, by hanging it down; arrogance, by lifting it up; languishment, by inclining it on one side; and obstinacy, when with a stiff and resolute air it stands upright, fixed, and stiff between the two shoulders. The head also best shews our supplications, threats, mildness, pride, love, hatred, joy, and grief. The whole face, and every feature, contributes something: especially the eyes; which, as Cicero says, are the windows of the soul. The passions they more particularly discover are, pleasure, languishing, scorn, severity, mildness, admiration, and anger; to which one might add joy and grief, if they did not proceed more particularly from the eye-brows and mouth; but when those two passions fall in also with the language of the eyes, the harmony will be wonderful. "But though the passions of the soul are most visible in the lines and features of the face, they often require the assistance also of the other parts of the body. Without the hands, for instance, all action is weak and imperfect; their motions, which are almost infinite, create numberless expressions: it is by them

them that we desire, hope, promise, call, send back; they are the instruments of threatening, prayer, horror, and praise; by them we approve, condemn, refuse, admit, fear, ask; express our joy and grief, our doubts, regrets, pain, and admiration. In a word, it may be said, as they are the language of the dumb, that they contribute not a little to speak a language common to all nations, which is the language of painting. But to say how these parts must be disposed for expressing the various passions, is impossible, nor can any exact rules be given for it, both because the task would be infinite, and because every one must be guided in this by his own genius, and the particular turn of his own studies." According to M. Le Brun, the particular passions produce their action on the body as expressed in the following rules:

1. The effects of **ATTENTION** are to make the eye-brows sink and approach the sides of the nose; to turn the eye-balls towards the object that causes it; to open the mouth, and especially the upper part; to decline the head a little, and fix it without any other remarkable alteration.

2. **ADMIRATION** causes but little agitation in the mind, and therefore alters but very little the parts of the face; nevertheless the eye-brow rises: the eye opens a little more than ordinary; the eye-ball placed equally between the eye-lids appears fixed on the object; the mouth half opens, and makes no sensible alteration in the cheeks.

3. The motions that accompany **ADMIRATION** with **ASTONISHMENT**, are hardly different from those of simple admiration, only they are more lively and stronger marked; the eye-brows more elevated; the eyes more open; the eye-ball further from the lower eye-lid, and more steadily fixed: the mouth is more open, and all the parts in a much stronger emotion.

4. Admiration begets esteem, and this produces **VENERATION**, which, when it has for its object something divine, or beyond our comprehension, makes the face decline, and the eye-brows bend down; the eyes are almost shut and fixed: the mouth is shut. These motions are gentle, and produce but little alterations in the other parts.

5. Although **RAPTURE** has the same object as veneration, only considered in a different manner, its motions are not the same; the head inclines to the left side; the eye-balls and eye-brows rise directly up; the mouth half opens, and the two corners are also a little turned up: the other parts remain in their natural state.

6. The passion of **DESIRE** brings the eye-brows close together and forwards toward the eyes, which are more open than ordinary; the eye-ball is inflamed, and places itself in the middle of the eye; the nostrils rise up, and are contracted towards the eyes; the mouth opens, and the spirits being in motion, give a lively glowing colour.

7. Very little alteration is remarked in the face of those that feel within themselves the sweetness of **JOY**, or joy with **TRANQUILITY**. The forehead is serene; the eye-brow without motion, elevated in the middle; the eye pretty open, and with a laughing air; the eye-ball lively and shining; the corners of the mouth turn up a little; the complexion is lively; the cheeks and lips are red.

8. **LAUGHTER**, which is produced by joy mixed with surprise, makes the eye-brows rise towards the middle of the eye, and bend towards the sides of the nose; the eyes are almost shut, and sometimes appear wet, or shed tears, which make no alteration in the face; the mouth half open, shews the teeth; the corners of the mouth drawn back, cause a wrinkle in the cheeks, which appear so swelled as to hide the eyes in some measure; the nostrils are open, and all the face is of a red colour.

9. **ACUTE PAIN** makes the eye-brows approach one another, and rise towards the middle; the eye-ball is hid under the eye-brows; the nostrils rise and make a wrinkle in the cheeks; the mouth half opens and draws back: all the parts of the face are agitated in proportion to the violence of the pain.

10. **SIMPLE BODILY PAIN** produces proportionally the same motions as the last, but not so strong: the eye-brows do not approach and rise so much; the eye-ball appears fixed on some object; the nostrils rise, but the wrinkles in the cheeks are less perceptible; the lids are further asunder towards the middle, and the mouth is half open.

11. The dejection that is produced by **SADNESS** makes the eye brows rise towards the middle of the forehead more than towards the cheeks; the eye-ball appears full of perturbation; the white of the eye is yellow; the eye-lids are drawn down, and a little

swelled; all about the eyes is livid; the nostrils are drawn downward; the mouth is half open, and the corners are drawn down; the head carelessly leaning on one of the shoulders: the face is of a lead colour; the lips pale.

12. The alterations that **WEeping** occasions are strongly marked: the eye-brows sink down towards the middle of the forehead; the eyes are almost closed, wet, and drawn down towards the cheeks; the nostrils swelled; the muscles and veins of the forehead appear; the mouth is shut, and the sides of it are drawn down, making wrinkles on the cheeks; the under lip pushed out presses the upper one: all the face is wrinkled and contracted; its colour is red, especially about the eye-brows, the eyes, the nose, and the cheeks.

13. The lively attention to the misfortunes of another, which is called **COMPASSION**, causes the eye-brows to sink towards the middle of the forehead; the eye-ball to be fixed upon the object; the sides of the nostrils next the nose to be a little elevated, making wrinkles in the cheeks; the mouth to be open; the upper lip to be lifted up and thrust forwards; the muscles and all the parts of the face sinking down and turning towards the object which excites the passion.

14. The motions of **SCORN** are lively and strong: the forehead is wrinkled; the eye-brow is knit; the side of it next the nose sinks down, and the other side rises very much; the eye is very open, and the eye-balls in the middle; the nostrils rise, and draw towards the eyes, and make wrinkles in the cheeks; the mouth shuts, its sides sinking down, and the upper lip is pushed out beyond the upper one.

15. An object despised sometimes causes **HORROR**, and then the eye-brow knits, and sinks a great deal more. The eye-ball, placed at the bottom of the eye, is half-covered by the lower eye-lid; the mouth is half open, but closer in the middle than the sides, which being drawn back, makes wrinkles in the cheeks; the face grows pale, and the eyes become livid; the muscles and the veins are marked.

16. The violence of **TERROR**, or **FRIGHT**, alters all the parts of the face; the eye-brow rises in the middle; its muscles are marked, swelled, pressed one against the other, and sunk towards the nose, which draws up as well as the nostrils; the eyes are very open; the upper eye-lid is hid under the eye-brow; the white of the eye is encompassed with red; the eye-ball fixes toward the lower part of the eye; the lower part of the eye-lid swells and becomes livid; the muscles of the nose and cheeks swell, and these last terminate in a point toward the sides of the nostrils; the mouth is very open, and its corners very apparent; the muscles and veins of the neck stretched; the hair stands on end; the colour of the face, that is, the end of the nose, the lips, the ears, and round the eyes, is pale and livid; and all ought to be strongly marked.

17. The effects of **ANGER** shew its nature. The eyes become red and inflamed; the eye-ball is staring and sparkling; the eye-brows are sometimes elevated, and sometimes sunk down equally; the forehead is very much wrinkled, with wrinkles between the eyes; the nostrils are open and enlarged; the lips pressing against one another, the under one rising over the upper one leaves the corners of the mouth a little open, making a cruel and disdainful grom.

18. **HATRED** or **JEALOUSY** wrinkles the forehead; the eye-brows are sunk down and knit; the eye-ball is half hid under the eye-brows, which turn towards the object; it should appear full of fire, as well as the white of the eye and the eye-lid; the nostrils are pale, open, more marked than ordinary, and drawn backward so as to make wrinkles in the cheeks; the mouth is so shut as to shew the teeth are closed; the corners of the mouth are drawn back and very much sunk; the muscles of the jaw appear sunk; the colour of the face is partly inflamed and partly yellowish; the lips pale or livid.

19. As **DESPAIR** is extreme, its motions are so likewise; the forehead wrinkles from the top to the bottom; the eye-brows bend down over the eyes, and press one another on the sides of the nose; the eye seems to be on fire, and full of blood; the eye-ball is disturbed, hid under the eye-brow, sparkling and unfixed; the eye-lid is swelled and livid; the nostrils are large, open, and lifted up; the end of the nose sinks down; the muscles, tendons, and veins are swelled and stretched; the upper part of the cheek is large, marked, and narrow towards the jaw; the mouth drawn backwards is more open at the sides than in the middle; the lower lip

lip is large and turned out; the persons gnash their teeth; they foam; they bite their lips, which are pale; as is the rest of the face; the hair is strait and stands on end.

VIII. OF THE DISTRIBUTION OF LIGHT AND SHADE.

After the learner has made himself in some measure perfect in drawing outlines, his next endeavour must be to shade them properly. It is this which gives an appearance of substance, shape, distance, and distinction, to whatever bodies he endeavours to represent, whether animate or inanimate. The best rule for doing this is to consider from what point, and in what direction, the light falls upon the objects which he is delineating, and to let all his lights and shades be placed according to that direction throughout the whole work. That part of the object must be lightest which has the light most directly opposite to it; if the light falls sideways on the picture, he must make that side which is opposite to it lightest, and that side which is farthest from it darkest. If he is drawing the figure of a man, and the light be placed above the head, then the top of the head must be made lightest, the shoulders next lightest, and the lower parts darker by degrees. That part of the object, whether in naked figures, or drapery, or buildings, that stands farthest out, must be made the lightest, because it comes nearest to the light; and the light loseth so much of its brightness, by how much any part of the body bends inward, because those parts that stick out hinder the lustre and full brightness of the light from striking on those parts that fall in. Titian used to say, that he knew no better rule for the distribution of lights and shadows than his observations drawn from a bunch of grapes. Satins and silks, and all other shining stuffs, have certain glancing reflections, exceeding bright where the light falls strongest. The like is seen in armour, brass pots, or any other glittering metal, where a sudden brightness appears in the centre of the light, which discovers the shining nature of such things. A strong light requires a strong shade, a fainter light a fainter shade; and an equal balance must be preserved throughout the piece between lights and shades. Those parts which must appear round require but one stroke in shading, and that sometimes but very faint; such parts as should appear steep or hollow, require two strokes across each other, or sometimes three, which is sufficient for the deepest shade. Care must be also taken to make the outlines faint and small in such parts as receive the light; but where the shades fall, the outline must be strong and bold. The learner must begin his shadings from the top, and proceed downward, and use his utmost endeavours, both by practice and observation, to learn how to vary the shadings properly; for in this consist a great deal of beauty and elegance in drawing. Another thing to be observed is, that as the human sight is weakened by distances, so objects must seem more or less confused or clear according to the places they hold in the piece: those that are very distant, weak, faint, and confused; those that are near and on the foremost ground, clear, strong, and accurately finished.

IX. OF DRAPERY.

In the art of clothing the figures, or casting the drapery properly and elegantly upon them, many things are to be observed. 1. The eye must never be in doubt of its object; but the shape and proportion of the part or limb, which the drapery is supposed to cover, must appear; or at least so far as art and probability will permit: and this is so material a consideration, that many artists draw first the naked figure, and afterwards put the draperies upon it. 2. The drapery must not fit too close to the parts of the body; but let it seem to flow round, and as it were to embrace them; yet so that the figure may be easy, and have a free motion. 3. The draperies which cover those parts that are exposed to great light, must not be so deeply shaded as to seem to pierce them; nor should those members be crossed by folds that are too strong, lest, by the two great darkness of their shades, the members look as if they were broken. 4. The great folds must be drawn first, and then stroked into less ones: and great care must be taken that they do not cross one another improperly. 5. Folds in general should be large, and as few as possible. However, they must be greater or less, according to the quantity and quality of the stuffs of which the drapery is supposed to be made. The quality of the persons is also to be considered in the drapery. If they are magistrates, their draperies ought to be large and ample; if country clowns or slaves, they ought to be coarse

and short; if ladies or nymphs, light and soft. 6. Suit the garments to the body, and make them bend with it, according as it stands in or out, straight or crooked; or as it bends one way or another; and the closer the garment fits to the body, the narrower and smaller must be the folds. 7. Folds well imagined give much spirit to any kind of action; because their motion implies a motion in the acting member, which seems to draw them forcibly, and makes them more or less stirring as the action is more or less violent. 8. An artful complication of folds in a circular manner greatly helps the effect of fore-shortenings. 9. All folds consist of two shades, and no more; which may be turned with the garment at pleasure, shadowing the inner side deeper, and the outer more faintly. 10. The shades in silk and fine linen are very thick and small, requiring little folds and a light shadow. 11. Observe the motion of the air or wind, in order to draw the loose apparel all flying one way: and draw that part of the garment that adheres closest to the body, before you draw the looser part that flies off from it; lest, by drawing the loose part of the garment first, you should mistake the position of the figure, and place it awry. 12. Rich ornaments, when judiciously and sparingly used, may sometimes contribute to the beauty of draperies. But such ornaments are far below the dignity of angels or celestial figures; the grandeur of whose draperies ought rather to consist in the boldness and nobleness of the folds, than in the quality of the stuff or the glitter of ornaments. 13. Light and flying draperies are proper only to figures in great motion, or in the wind; but when in a calm place, and free from violent action, their draperies should be large and flowing; that, by their contrast, and the fall of the folds, they may appear with grace and dignity. Examples of drapery are given in Plate LXI. See also PAINTING.

X. OF DRAWING LANDSCAPES, BUILDINGS, &c.

Of all the branches of drawing, this is the most useful and necessary, as it is what every man may have occasion for at one time or another. To be able, on the spot, to take the sketch of a fine building, or a beautiful prospect; of any curious production of art, or uncommon appearance in nature; is not only a very desirable accomplishment, but a very agreeable amusement. Rocks, mountains, fields, woods, rivers, cataracts, cities, towns, castles, houses, fortifications, ruins, or whatsoever else may present itself to view on our journeys or travels, in our own or foreign countries, may be thus brought home and preserved for our future use either in business or conversation. On this part, therefore, more than ordinary pains should be bestowed. All drawing consists in nicely measuring the distances of each part of the piece by the eye. In order to facilitate this, let the learner imagine in his own mind, that the piece he copies be divided into squares. For example: suppose a perpendicular and horizontal line crossing each other, in the centre of the picture you are drawing from; then suppose also two such lines crossing your own copy. Observe in the original, what parts of the design those lines intersect, and let them fall on the same parts as the supposed lines in the copy. To draw a landscape from nature, let him take his station on a rising ground, where he will have a large horizon; and mark his tablet into three divisions, downwards from the top to the bottom; and divide in his own mind the landscape he is to take, into three divisions also. Then let him turn his face directly opposite to the midst of the horizon, keeping his body fixed, and draw what is directly before his eyes upon the middle division of the tablet; then turn his head, but not his body, to the left hand, and delineate what he views there, joining it properly to what he had done before; and, lastly, do the same by what is to be seen upon his right hand, laying down every thing exactly both with respect to distance and proportion. Examples are given on Plate LXI. fig. E. The best artists of late, in drawing their landscapes, make them shoot away one part lower than another. Those who make their landscapes mount up higher and higher, as if they stood at the bottom of a hill to take the prospect, commit a great error: the best way is for the artist to get upon a rising ground, make the nearest objects in the piece the highest, and those that are farther off to shoot away lower and lower, till they come almost level with the line of the horizon, lessening every thing proportionably to its distance, and observing also to make the objects fainter and less distinct, the farther they are removed from the eye. He must make all his lights and sades fall one way, and let every thing have its proper motion: as trees shaken by the wind, the small bows bending more, and the large

large ones less: water agitated by the wind, and dashing against ships or boats; or falling from a precipice upon rocks or stones, spirting up again into the air, and sprinkling all about: clouds also in the air, now gathered with the winds: now violently condensed into hail, rain, and the like: Always remembering, that whatever motions are caused by the wind must be made all to move the same way. For further particulars on this and the other parts of drawing, see PAINTING.

XI. OF MECHANICAL DRAWING, OR COPYING.

There are various methods by which those who are ignorant of the art of drawing may copy very accurately the outlines of pictures, prints, and drawing; and these methods are often useful to those who can draw, and to engravers, when either great expedition, or great accuracy, is required; though none of them should ever be used by one who is learning to draw.

TRACING AGAINST THE LIGHT. Hold the drawing you wish to copy against one of the panes of the window; or have a pane of glass put in a frame, and fitted up like a music-stand, with a candle behind it. Lay your paper over the drawing, and you will see all the lines of the original distinctly through it, by which means you can easily trace them with a pen, or black-lead pencil.

TO MAKE TRACING-PAPER. Mix together equal parts of oil of turpentine and drying-oil, and with a rag rub it evenly over some fan or tissue-paper, or any other very thin paper. Hang it by to dry for a day or two, and it will be fit for use. Lay this over the print or drawing you want to copy, and you will see every line distinctly through, so that you can go over it with the black-lead pencil. If you wish to do it in ink, you must mix a little ox's gall with the ink, to make the paper take it, which it would not otherwise do on account of the oil.

TO MAKE CAMP-PAPER. Take some hard soap, mix it with lamp-black; make it into the consistence of a jelly with water; with this, brush over one side of your paper, and let it dry. When you use it, put it between two sheets of clean paper, with its black side downwards; and with a pin, or stick with a sharp point, draw or write what you please upon the clean paper; and where the tracer was touched, there will be an impression upon the lowermost sheet of paper as if it had been written or drawn with a pen. It may be made of any colour, by mixing with the soap, black lead, vermilion, &c.

STENCILING. Lay the print or drawing you wish to have copied over a sheet of paper, and with a pin or needle prick all the outline over with holes, through both the papers. Then take the clean paper with the holes made in it, and lay it upon the paper you wish to have the design transferred to, and dust it over with the powder of charcoal in a small muslin bag; the dust will penetrate through the holes, and leave a correct copy of the original upon the paper. This pricked paper will do again for any number of copies. This is very useful for ladies who work flowers upon muslin.—The method of enlarging and contracting by squares. Divide the sides of your original with a pair of compasses into any number of equal parts, and rule lines across with a black-lead pencil from side to side, and from top to bottom. Then having your paper of the size you intend, divide it into the same number of squares, either larger or less, as you would enlarge or contract it. Then placing your original before you, draw, square by square, the several parts, observing to make the part of the figure you are drawing fall into the same part of the squares in the copy as it does in your original. To prevent mistakes, number the squares both of the original and copy. This method is much used by engravers. To prevent the necessity of ruling across the original, which in some cases may injure it, take a square pane of crown glass, and divide its sides, and also its top and bottom, into equal parts: then for each division draw lines across the glass with lamp-black ground with gum water, and you will divide the glass into squares. Then lay the glass upon the original which you wish to copy, and having drawn the same number of squares upon your paper, proceed to copy into each square on your paper what appears behind each corresponding square of the glass. Instead of a glass, an open frame with threads stretched across will answer the same purpose.

THE PENTAGRAPH. The pentagraph is an instrument, by means of which one may copy, enlarge, or reduce, the outlines of any picture, print, or drawing. It may be had at most mathematical

cal instrument-makers, and is extremely useful for copying plans, maps, and other complicated figures.

TRANSPARENCIES. The effect of this kind of drawing, which has lately become very fashionable, though by no means a modern invention, is very pleasing, if managed with judgement, particularly in fire and moonlights, where brilliancy of light and strength of shade are so very desirable. The very great expence attending the purchase of stained-glass, and the risk of keeping it secure from accident, almost precludes the use of it in ornamenting rooms; but transparencies form a substitute nearly equal, and at a very small expence. The paper upon which you intend to draw must be fixed in a straining-frame, in order that you may be able to place it between you and the light, when you see occasion in the progress of your work. After tracing in your design, the colours must be laid on in the usual method of stained drawing. When the tints are got in, you must place your picture against the window, on a pane of glass framed for the purpose, and begin to strengthen the shadows with Indian ink, or with colours, according as the effect requires, laying the colours sometimes on both sides of the paper, to give greater force and depth of colour. The last touches for giving final strength to shadows and forms, are to be done with ivory-black, or lamp-black, prepared with gum-water, as there is no pigment so opaque and capable of giving strength and decision.

When the drawing is finished, and every part has got its depth of colour and brilliancy, being perfectly dry, you touch very carefully with spirits of turpentine on both sides those parts which are to be the brightest, such as the moon and fire; and those parts requiring less brightness, only on one side. Then lay on immediately with a pencil a varnish, made by dissolving one ounce of Canada balsam in an equal quantity of spirit of turpentine. You must be cautious with the varnish, as it is apt to spread. When the varnish is dry you tint the flame with red lead and gamboge, slightly tinging the smoke next the flame: the moon must not be tinted with colour. Much depends upon the choice of the subject; and none is so admirably adapted to this species of effect as the gloomy Gothic ruin, whose antique towers and pointed turrets finely contrast their dark battlements with the pale yet brilliant moon. The effect of rays passing through the ruined windows, half-choked with ivy; or of a fire among the clustering pillars and broken monuments of the choir, round which are figures of banditti, or others whose haggard faces catch the reflecting light: these afford a peculiarity of effect not to be equalled in any other species of painting. Internal views of cathedrals also where windows of stained glass are introduced, have a beautiful effect. The following is a very easy method of drawing and shading objects. Take a sheet of the thinnest, or white-brown paper, and brush it over with oil of turpentine, which will immediately render it transparent: then, after drying the paper in the air, strain it upon a frame, and fix it against the object you design to draw: this done, place right before it a piece of wood with a hole in it, fit for one's eye to look through, and as you meet any outlines of the object on the transparent paper, trace them over with a pencil; by which means you will obtain the just proportion, and true representation of any object in its outlines. To render this still more pleasing, observe the tracings of your draught, wherever the shades are, and mark them with your pencil; for all the art in the world can never dispose the shades so regularly, as one may touch by this method; but the shades must be drawn quickly after the outlines are drawn, not at different times, because the sun instantly changes them. Here observe, as in certain objects you will have fainter, stronger, and darker shades, in your remarks of them, to take such memorandums as may direct you how to finish them with Indian ink, or other colour, when you sit down to complete your work. To this end the best way before you trace out your object, is to prepare three shells or gallipots of Indian ink, mixed with common water, viz. one of a very faint black, one of a middling black, and one of an intense black, numbering them 1, 2, 3; and as you make your obscuration on the shades of your object, mark upon your draught the same numbers as they happen to appear, so that afterwards you may finish with certainty. In this regard the transparent paper is of great use; for, being laid upon any paper or print in a loose sheet, all the lines will be seen so perfectly through it, that you may copy them with the greatest ease; and if the print or picture be done by a good master, you can see which lines are strong, which soft, and how to imitate them. Some prefer to the transparent

parent paper, either white or black tiffany or lawn stained upon a frame, and used in the same manner as the paper, excepting that, as the black-lead pencil is used to the paper, on the white tiffany and on the lawn you must use charcoal very soft and finely powdered; but on the black tiffany very tender white chalk is to be used. A draught may be taken regularly, from a drawing, on transparent paper, as follows: Take a piece of paper of the same size with that of the draught; rub one side of it with some powder of black lead, till it be well and equally blacked, so that a finger touching it, will hardly be tinged with the blacking; then take the print, and laying the paper underneath it with the black side downwards, upon another place of white paper of the same size, pin the three together in two or three places: afterwards, take a pin or needle, somewhat blunted at the point, and trace it over the outlines of your picture, which, with a little pressing, will direct the black paper to impress the white, so as to receive every stroke you draw: this done, you may carefully correct what errors you see with your black-lead pencil, cleaning the new-made draught slightly with the crumb of stale bread. As for the draughts taken on tiffany or lawn, they are only to be laid on paper; that is, such as are drawn with charcoal upon white, and those drawn with chalk upon black or blue paper; and then, giving each of them a knock or two with the hammer, the charcoal or the chalk will fall through them upon the papers directly in the lines they were drawn, and give you the true representation of the object drawn from the life, in white lines upon the black paper, and in black lines upon the white. Then strengthen these shadows of drawings with your black-lead pencil, chalk, or red oker, upon the pieces of paper where they made the marks; for otherwise the lines will easily be rubbed out. But it must be observed, that this amendment is to be made soon after the lines; because those tender draughts will quickly vanish, if care be not taken to strengthen them immediately. You are to begin this operation at the bottom of the drawing. There is another way which may be more easy to the hand or arm of a person not accustomed to drawing upon a paper or lawn placed upright, which is by the use of a camera obscura; though to help the hand one may hold a baguette, or such a stick in the left hand as the oil-painters use to rest the right hand upon; or have some other rest made for the right hand, as may be easily screwed up and down at pleasure. But there is this difference still between drawing a piece of perspective, or view, on a transparent paper or lawn placed upright against any object, and drawing by the camera obscura; that such a piece will take in more of the view or object, and from a greater distance, than the camera obscura will: however, the portable camera obscura will, at first, be very easy to the arm of a beginner, by reason the objects appear on a horizontal plane, such as a table; and the hand, having a proper rest, will more easily follow the line represented on the plane with great exactness. The camera obscura is a machine or apparatus wherein the images of external objects are represented distinctly, and in their genuine colours, either in an inverted or erect situation. This machine may be made as follows; Darken a chamber, one of whose windows looks into a place set with a variety of objects, leaving only one little aperture open in the window. In this aperture fit a lens, either a plano convex one, or one convex on both sides, so as to be the portion of a large sphere. At a due distance, to be determined by experience, spread a paper or white cloth on the wall, unless the wall itself be whitened so as to serve the purpose; and on this the images of the desired objects will be delineated invertedly, and hence may be copied with ease. It is to be observed, that if the aperture does not exceed the bigness of a pea, the objects will be represented thereon, even though there be no lens at all. To render the images clear

and distinct, it is necessary that the objects be illuminated by the sun; and they will be still brighter if the spectator first stay a quarter of an hour in the dark. Care must be likewise taken that no light escape through any chinks, and that the wall be not too much illuminated. Farther, the greater the distance between the aperture and the wall, the larger and more distinct will the images be; but the rays becoming thus too much dilated, the brightness of the image is weakened, till at length it becomes insensible. But the portable camera obscura is more proper for beginners, as being more easy for their arm; besides, the objects appearing on a horizontal plane, may, of course, be drawn with greater exactness. Two other methods, both easy and entertaining, for taking of draughts or drawing, are as follows: 1st. Prick with a pin the outlines of the print or drawing you design to copy, and then laying the same on a sheet of paper, take a powder-puff or tuft of cotton, dipping it now and then in charcoal-dust, and beat it over the pricked lines through the picture, by which means you will have full directions marked on your cloth or paper sufficient to finish a just drawing. 2d. The other way is by making such an impression from the print as shall give a just copy of it; and it is of great use when we want to carry every stroke of the graver along with us; which method, if you are very careful, will indeed but very little sully the print. For this end, take some white or green soap, which mix with such a quantity of water as will bring it to the consistency of a jelly; with this mixture rub the print, and with a wet sponge gently wet the paper designed for receiving the impression; then laying it on the print, cover all with two or three other pieces of dry paper, and rub it very hard all over with any thing that is smooth and polished; and thus the wetted paper will have upon it the reverse of the print you rubbed it upon, with every distinct line in the original, if you have been careful to rub it equally.

TO TAKE THE NATURAL FORM OF A LEAF. First take the leaf you would copy, and gently rub the veins on the back side of it with a piece of ivory, or some such like matter, so as to bruise them a little; afterwards wet the same side gently with linseed-oil, and then press it hard upon a piece of white paper, and you shall have the perfect figure of the leaf, with every vein in it justly expressed: this impression being afterwards coloured will seem truly natural, and may be useful to such as would remember plants. Another way of painting the leaves of plants, so that the impression shall appear as black as if it had been done in a printing-press, is as follows: When the leaf is dry, take such a ball as the pressmen use for blacking the types, and rubbing it equally over with printer's ink, strike it gently four or five times on the back of the leaf, till all the veins are blacked with the ink: then laying the leaf on a flat board or the like, with the back side upwards, clap a piece of white paper well moistened on the leaf; and pressing it pretty hard, but not so as to bruise the fibres, you shall have a fine impression. But this may be done to still greater advantage by means of a piece of wood in the form of a cylinder, about a foot long, and an inch and a half diameter, the middle part about six or eight inches long, being covered with a woollen cloth rolled three or four times round it. With this cylinder roll the paper over the leaf four or five times backwards and forwards, and you will have a curious impression. But where printer's ink is not conveniently come at, the following method may be made use of: Rub the back of the leaf, as before directed, with burnt linseed-oil: then, strewing some powder of black lead, or, for want of that, some charcoal or small-coal dust, or the powder of burnt cork, upon a smooth board, so as equally to cover it, stroke the powder gently over; and oiling the back side of the leaf, clap it upon the board; then laying the white paper upon the back of the leaf, press or roll it as before.

DRAYTON, a town in Shropshire, on the Torn, 17 miles N. E. of Shrewsbury.

DREAMS are all those thoughts which people feel passing through their minds, and those imaginary transactions in which they often fancy themselves engaged, when in the state of sleep. Scarce any part of nature is less open to our observation than the human mind in this state. The dreamer himself cannot well observe the manner in which dreams arise or disappear to him.

VOL. II.—NO. 68.

When he awakes, he cannot in general recollect the circumstances of his dreams with sufficient accuracy. Were we to watch over him with the most vigilant attention, we could not perceive what emotions are excited in his mind, or what thoughts pass through it, during his sleep. But though we could ascertain these phenomena, many other difficulties would still remain. What parts of a human being are active, what dormant, when he dreams? Why does he not always dream while asleep? Or why dreams he

3 D

at

at all? Do any circumstances in our constitution, situation, and peculiar character, determine the nature of our dreams? Without pretending to solve the above difficulties we shall here briefly mention the following facts concerning dreams, as deduced by those who have paid particular attention to the subject. 1. In dreaming, we are not conscious of being asleep. This is well known from a thousand circumstances. When awake, we often recollect our dreams; and we remember on such occasions, that while those dreams were passing through our minds, it never occurred to us, that we were separated by sleep from the active world: except in those cases, where we have a kind of double dream; *i. e.* when, after dreaming for some time, we dream that we have awaked from sleep, and told our preceding dream, while in fact we still continue asleep the whole time. But during this second dream, and rehearsal of our former one, we are fully persuaded that we are awake, till by awaking in reality, we are convinced that we are asleep all the time. We are also often observed to act and talk in dreaming, as if we were busily engaged in the intercourse of social life. 2. In dreaming, we do not consider ourselves as witnessing or bearing a part in a fictitious scene: we seem not to be in a similar situation with the actors in a dramatic performance, or the spectators before whom they exhibit, but engaged in the business of real life. All the varieties of thought, that pass through our minds when awake, may also occur in dreams; all the images which imagination presents in the former state, she is also able to call up in the latter; all the same emotions may be excited, and we are often actuated by equal violence of passion; none of the transactions, in which we are capable of engaging while awake, is impossible in dreams: in short, our range of action and observation is equally wide in the one state as in the other; nay often more so; for we may dream of flying, walking upon waters, and the like actions, which we cannot perform when awake: and while dreaming, we are not sensible of any distinction, between our dreams and the events and transactions in which we are actually concerned, in our intercourse with the world. 3. It is said, that all men are not liable to dream. Dr. Beattie, in a very pleasing essay on this subject, relates, that he knew a gentleman who never dreamed, except when his health was in a disordered state: and Locke mentions, that a person of his acquaintance was a stranger to dreaming till the 26th year of his age; when he began to dream in consequence of having a fever. These instances, however, are two few; and, besides, it does not appear that those persons had always attended, with the care of a philosopher making an experiment, to the circumstances of their sleep. They might dream, but not recollect their dreams on awaking; and they might both dream and recollect their dreams immediately upon awaking, yet afterwards suffer them to slip out of their memory. We do not advance this therefore as a certain fact concerning dreaming; we are rather inclined to think it a mistake. But though it is by no means certain, that any of the human race are through the whole of life absolute strangers to dreaming; yet it is well known, that all men are not equally liable to dream. The same person dreams more or less at different times; and as one person may be more exposed than another, to those circumstances which promote this exercise of fancy, one person may therefore dream much oftener than another. The same diversity will naturally take place in this as in other accidents to which mankind are in general liable. 4. Though in dreams imagination appears to be free from all restraint, and indulges in the most wanton freaks; yet it is agreed, that the imaginary transactions of the dreamer, if in health, generally bear some relation to his particular character in the world, his habits of action, and the circumstances of his life. The lover dreams of his mistress; the miser of his money; the philosopher renews his scientific researches in sleep with the same assiduity as when awake; and the merchant returns to balance his books, and compute the profits of an adventure, when slumbering on his pillow. And not only to do the general circumstances of a person's life influence his dreams; but his passions and habits are nearly the same when asleep as when awake. A person whose habits of life are virtuous, does not in his dreams plunge into a series of crimes; nor are the vicious reformed, when they pass into this imaginary world. The choleric man finds himself offended by slight provocations in his dreams, as well as in his ordinary intercourse with the world, and a mild temper continues pacific in sleep. 5. The character of a person's dreams is influenced by his circumstances

when awake, in a still more unaccountable manner. Certain dreams usually arise in the mind after a person has been in certain situations. Dr. Beattie relates, that he once, after riding thirty miles in a high wind, passed a part of the succeeding night in dreams beyond description terrible. The state of a person's health, and the manner in which the vital functions are carried on, have a considerable influence in determining the character of dreams. After too full a meal, or after eating of an unusual sort of food, a person has dreams of a certain nature. 6. In dreaming, the mind for the most part carries on no intercourse through the senses with surrounding objects. Touch a person gently who is asleep, he feels not the impression. You may awake him by a smart blow; but when the stroke is not sufficiently violent, he remains insensible of it. We speak softly beside a person asleep without fearing that he will overhear it. His eye-lids are shut; and even though light should fall upon the eyeball, yet still his powers of vision are not awakened to active exertion, unless the light be so strong as to rouse him from sleep. He is insensible both to sweet and to disagreeable smells. It is not easy to try whether his organs of taste retain their activity, without awakening him; yet from analogy it may be presumed, that these too are inactive. With respect to the circumstances here enumerated, it is indifferent whether a person be dreaming or buried in a deep sleep. Yet there is one remarkable fact concerning dreaming which may seem to contradict what has been here asserted. In dreams, we are liable not only to speak aloud in consequence of the suggestions of imagination, but some persons even get up, and walk about and engage in little enterprises, without awaking. Now, as we are in this instance so active, it seems that we cannot be then insensible of the presence of surrounding objects. The sleep-walker is really sensible, in a certain degree, of the presence of the objects around him; but he does not attend to them with all their circumstances, nor do they excite in him the same emotions, as if he were awake. He feels no terror on the brink of a precipice; and in consequence of being free from fear, he is also without danger in such a situation unless suddenly awaked. This is one of the most inexplicable phenomena of dreaming. There is another fact not quite consonant with what has been above advanced. It is said, that in sleep a person will continue to hear the noise of a cataract in the neighbourhood, or regular strokes with a hammer, or any similar sound sufficiently loud, and continued uninterruptedly from before the time of his falling asleep. And it is affirmed, that he awakes on the sudden cessation of the noise. This fact is asserted on sufficient evidence: it is curious. Even when awake, if deeply intent on study, or closely occupied in business, the sound of a clock striking in the neighbourhood, or the beating of a drum, will escape us unnoticed: and it is therefore the more surprising, that we should thus continue sensible to sounds when asleep. 7. Not only do a person's general character, habits of life, and state of health, influence his dreams; but those concerns, in which he has been most deeply interested during the preceding day, and the views which have arisen most frequently to his imagination, very often afford the subjects of his dreams. When one looks forward with anxious expectation towards any future event, he is likely to dream either of the disappointment, or the gratification of his wishes. If engaged through the day, either in business or amusements which he found exceedingly agreeable, or in a way in which he has been extremely unhappy, either his happiness or his misery is likely to be renewed in his dreams. 8. Though all kinds of dreams have been regarded among almost all nations, at least in some periods of their history, as prophetic of future events; yet it does not appear that this popular opinion has been established on good grounds. Christianity, indeed, teaches us to believe, that the Supreme Being may, and actually does, operate on our minds, and influence at times the determinations of our will, without making us sensible of the restraint to which we are thus subjected. And, in the same manner, no doubt, the suggestions which arise to us in some particular dreams may be produced. The imaginary transactions, in which we are then engaged, may be such as are actually to occupy us in life; the strange and seemingly incoherent appearances, which are then presented to the mind, may allude to some events which are to befall ourselves or others. It is, therefore, by no means inconsistent with the general providence of God, that some dreams should have a respect to futurity. We have no reason to regard the dreams, which are related in the Holy Scriptures, as

not inspired by heaven, or to laugh at the idea of a prophetic dream as absurd or ridiculous. The dreams of Joseph and Pharaoh; his chief butler and baker; of Nebuchadnezzar and the prophet Daniel, &c. are decisive on this point. Yet it would be too much, to allow to dreams all that importance which has been ascribed to them by the priesthood among heathen nations, or by the vulgar among ourselves. We know how easily ignorance imposes on itself, and what arts imposture adopts to impose upon others. We cannot trace any certain connection between our dreams and those events, to which the simplicity of the vulgar pretends that they refer. And we cannot, therefore, join with the vulgar and the superstitious in believing them really referable to futurity. 9. It appears that the brutes are also capable of dreaming. The dog is often observed to start suddenly up in his sleep, in a manner which cannot be accounted for any other way, than by supposing that he is roused by some impulse received in a dream. The same thing is observable of other brutes. That they should dream, is not an idea inconsistent with what we know of their economy and manners in general. We may, therefore, consider it as a pretty certain truth, that many, if not all, of the inferior animals are liable to dream, as well as human beings. It appears, then, that in dreaming we are not conscious of being asleep: that to a person dreaming, his dreams seem realities: that though it be uncertain whether mankind are all liable to dreams, yet it is well known that they are not all equally liable to dream: that the nature of a person's dreams depends in some measure on his habits of action, and on the circumstances of his life: that the state of the health too, and the manner in which the vital functions are carried on, have a powerful influence in determining the character of a person's dreams: that in sleep and in dreaming, the senses are either absolutely inactive, or nearly so: that such concerns as we have been very deeply interested in during the preceding day, are very likely to return upon our minds in dreams in the hours of rest: that dreams may be rendered prophetic of future events; and therefore, wherever we have such evidence of their having been prophetic, as we would accept on any other occasion, we cannot reasonably reject the fact as absurd; but that they do not appear to have been actually such, in those numerous instances in which the superstition of nations, ignorant of true religion, has represented them as referring to futurity, nor in those instances in which they are viewed in the same light by many among ourselves: and, lastly, that dreaming is not a phenomenon peculiar to human nature, but that brutes, in some instances, are liable to dream. We cannot tell by what laws of our constitution, we are thus liable to be so frequently engaged in imaginary transactions, nor what are the particular means by which the delusion is accomplished. The delusion is indeed remarkably strong. One will sometimes fancy that he reads a book, and actually enter into the nature of the imaginary composition before him, and even remember, after he awakes, what he then knows, that he only fancied himself reading. Another will sometimes dream that he is at church, and hears a sermon delivered, which he would be incapable of composing when awake. Can this be delusion? If delusion, how or for what purpose is it produced? The mind, it would appear, does not, in sleep, become inactive like the body; or at least is not always inactive while we are asleep. When we do not dream, the mind must either be inactive, or the connection between the mind and the body must be considered as in some manner suspended: and when we dream, the mind, though it probably acts in concert with the body, yet does not act in the same manner as when we are awake. It seems to be clouded or bewildered, in consequence of being deprived for a time of the service of the senses. Imagination becomes more active and more capricious: and all the other powers, especially judgement and memory, become disordered and irregular in their operations. We are far from wishing to restore the reign of superstition in the most distant degree; or to lead our readers to put faith in the numberless ridiculous interpretations, given by some pretenders to divination, of the ordinary run of dreams. The absurdity of the many traditional rules, laid down by such persons; such as, that dreaming of eggs prognosticates anger; of the washing of linens forebodes flitting; of green fields, sickness; of hanging, honour; of death, marriage; of fish, children; and of raw flesh, death, &c. &c. can only be exceeded by the folly of those who put faith in such fooleries. But notwithstanding this, innumerable instances might be adduced, in which the interference of

a Divine Providence is evident. Of these we give the following one from the "Perthensis," which the editors from their personal acquaintance with the parties know to be a fact. It is narrated in the "Weekly Mirror," printed at Edinburgh in 1781, and signed Verax. "In June 1752, Mr. Robert Aikenhead, farmer in Denstrath of Arnhall, in the Mearns, about five miles N. of Brechin, and seven from Montrose, went to a market called Tarrenty Fa'r, where he had a large sum of money to receive. His eldest son, Robert, a boy between seven and eight years of age, was sent to take care of the cattle, and happening to lie down upon a grassy bank before sun-set, fell fast asleep. Although the boy had never been far from home, he was immediately carried in his imagination to Tarrenty market, where, he dreamed, that his father, after receiving the money, set out on his return home, and was followed all the way by two ill-looking fellows, who, when he had got to the western dykes of Inglis-Mauldy, (the seat of the then lord Halkerton, now earl of Kintore,) and little more than a mile from home, attacked and attempted to rob him. Whereupon the boy thought he ran to his assistance, and when he came within a gun-shot of the place, called out some people, who were just going to bed, who put the robbers to flight. He immediately awoke in a fright, and without waiting to consider, whether it was a vision or a reality, ran as fast as he could to the place he had dreamed of, and had no sooner reached it, than he saw his father in the very spot and situation he had seen in his dream, defending himself with his stick against the assassins. He therefore immediately realized his own part of the visionary scene, by roaring out murder! which soon brought out the people, who running up to Mr. Aikenhead's assistance, found him victor over one of the villains, whom he had previously knocked down with a stone, after they had pulled him off his horse; but almost overpowered by the other, who repeatedly attempted to stab him with a sword; against which he had no other defence than his stick and his hands, which were considerably mangled by grasping the blade. Upon sight of the country people, the villain who had the sword ran off, but the other not being able was apprehended and lodged in jail. Mean time there was no small hue and cry after young Robert, whose mother missing him, and finding the cattle among the corn, was in the utmost anxiety, concluding that he had fallen into some water or peat moss. But her joy and surprise were equally great, when her husband returned with the boy, and told her how miraculously both his money and life had been preserved by his son's dream; although she was at first startled at seeing her husband's hands bloody. To those who deny the existence of a God, (adds the writer,) or the superintendence of a divine providence, the above narrative will appear as fabulous as any story in Ovid. To those who measure the greatness and littleness of events, by the arbitrary rules of human pride and vanity, it will perhaps appear incredible, that such a miracle should have been wrought for the preservation of the life of a country-farmer. But all who found their opinions upon the unerring rule of right and truth, which assures us, that a sparrow cannot fall to the ground without the permission of our heavenly father, (and who know, that in the sight of Him with whom there is no respect of persons or dignities, the life of the greatest monarch on earth, and that of the lowest of his subjects are of equal value,) will laugh at such silly objections, when opposed to well attested facts. That the above is one, could be attested upon oath, were it necessary, by Mr. and Mrs. Aikenhead, from whom I had all the particulars above narrated about 15 months ago."—"Edin. March 12, 1781." Various theories have been proposed to explain what appears most inexplicable in dreaming. The ingenious Mr. Baxter, in his treatise on the "Immateriality of the Human Soul," endeavours to prove that dreams are produced by the agency of some spiritual beings, who either amuse or employ themselves seriously in engaging mankind in all those imaginary transactions with which they are employed in dreaming. This theory, however, is far from being plausible. It leads us entirely beyond the limits of our knowledge. It requires us to believe without evidence. It is unsupported by any analogy. It creates difficulties still more inexplicable than those which it has been proposed to remove. Till it appear that our dreams cannot possibly be produced without the interference of other spiritual agents, possessing such influence over our minds as to deceive us with fancied joys, and involve us in imaginary afflictions,

tions, we cannot reasonably refer them to such a cause. Besides, from the facts which have been stated as well known concerning dreams, it appears that their nature depends both on the state of the body and on that of the mind. But were they owing to the agency of other spiritual beings, how could they be influenced by the state of the body; however, that the agency of spiritual intelligence is employed in some dreams there can be no doubt?—Wolfius, and after him M. Forney, have supposed, that dreams never arise in the mind, except in consequence of some of the organs of sensation having been previously excited. Either the ear or the eye, or the organs of touching, tasting, or smelling, communicate information, somehow, in a tacit, secret manner; and thus partly rouse its faculties from the lethargy in which they are buried in sleep, and engage them in a series of confused and imperfect exertions. But what passes in dreams is often so very different from all that we do when awake, that it is impossible for the dreamer himself to distinguish, whether his powers of sensation perform any part in this office. It is not necessary that imagination be always excited by sensation. Fancy, even when we are awake, often wanders from the present scene. Absence of mind is incident to the studious: the poet and the mathematician often forget where they are. We cannot discover from any thing that a person in dreaming displays to the observation of others, that his organs of sensation take a part in the imaginary transactions in which he is employed. In those instances, indeed, in which persons asleep are said to hear sounds; the sounds which they hear are also said to influence, in some manner, the nature of their dreams. But such instances are singular. Since then it appears, that the person who dreams is himself incapable of distinguishing, either during his dreams, or by recollection when awake, whether any new impressions are communicated to him in that state by his organs of sensation; that even by watching over him, and comparing our observations of his circumstances and emotions, in his dreams, with what he recollects of them after awaking, we cannot except in one or two singular instances, ascertain this fact; and that the mind is not incapable of acting while the organs of sensation are at rest, and on many occasions refuses to listen to the information which they convey; we may conclude, that the theory is groundless. Other physiologists tell us, that the mind, when we dream, is in a state of delirium. Sleep, they say, is attended with what is called a collapse of the brain; during which either the whole or part of the nerves of which it consists, are in a state in which they cannot carry on the usual intercourse between the mind and the organs of sensation. When the whole of the brain is in this state, we become entirely unconscious of existence, and the mind sinks into inactivity: when only a part of the brain is collapsed, we are then neither asleep nor awake, but in a sort of delirium between the two. This theory, like the last, supposes the mind incapable of acting without the help of sensation: it supposes that we know the nature of a state, of which we cannot ascertain the phenomena; it also contradicts a known fact, in representing dreams as confused images of things around us, not fanciful combinations of things not existing together in nature or in human life. We must treat it likewise, therefore, as a baseless fabric. It seems more probable that dreams arise from a constant flow of ideas which it appears are constantly presenting themselves to the mind. Every person must have observed, that when alone, and while his attention is not called to any particular subject, either by study, conversation, manual labour, sudden noise, or the objects around him; a kind of involuntary motion, (so to speak,) will take place in his ideas; and that if he makes no voluntary exertion of mind, to fix his attention upon one idea more than another, a rapid succession of very different ideas, some old and some recent, will occur in the course of a few minutes. Every person, who attends church regularly, or who has attended the lectures of an unentertaining public speaker, must be sensible, that such involuntary motions of his ideas have often taken place, when, either through the fault of the speaker, or that of the hearer, his attention has not been sufficiently fixed upon what was spoken. A person much addicted to study, and to the habit of fixing his ideas constantly upon one subject or another, may perhaps be less sensible of the involuntary motion we here allude to, than others: but let such a studious person be placed in a company, where a trifling conversation is going on, and he will soon find himself in a situation here described. A current of ideas will rapidly intrude upon

his mind, and carry off his attention from the trifles in which those around him are engaged; and thus subject him to what is commonly called absence of mind. And it will be also admitted, that the most studious, as well as the most thoughtless, will sometimes find an idea, of a long forgotten fact, sentiment, or circumstance, suddenly recurring to their minds, without any seeming cause. The inference we would draw from all these facts, to our present subject, is, that during sleep, a similar involuntary motion or current of ideas takes place; but that in consequence of the fatigue occasioned by the labours of the day, (no matter whether these operate by exhausting the excitability, or, by occasioning a deficiency of the nervous fluid,) the three chief powers of the mind—the will, the judgement, and the memory, are rendered in a considerable degree inactive; at least in so far, that the will has no power over these faculties, while the imagination, rendered more active, (as it would seem,) by being freed from the controul of both the will and the judgement, gives every new idea that occurs in a visionary form; and thus creates a fresh and rapid succession of various images, according to the unlimited current of uncontrolled ideas, that succeeded each other. How this happens, perhaps the human faculties will never be able to comprehend or explain; at least till they shall be capable of explaining the connection by which the soul and body are united, if indeed mankind shall ever attain to such a degree of perfection in physiology. But that dreams take their rise chiefly, if not solely, from the mere succession of ideas, dressed into form by the imagination, uncontrolled by the will, or the judgement, appears to us to be an undoubted fact, though hitherto it would seem little, if at all, attended to. And it appears to be a sufficient confirmation of this theory, that persons in good health, and engaged in active employments, most commonly dream of those matters wherein they are daily occupied; the uniform current of their ideas when awake, seldom taking any other direction during sleep; whereas persons in a bad habit of body, or weak state of mind, and those who take little exercise, or who are not engaged in active business, have generally wild and extravagant dreams, and sometimes very disagreeable ones, of monsters, mad dogs, devils, deep pits, houses on fire, stormy oceans, and the like. In a word, when we consider the operations of our minds when awake,—particularly of that active faculty, the imagination—how readily upon hearing, reading, or speaking, of any person, place, action, or circumstance, it forms an idea in the mind of such person, place, &c. though perhaps many years have elapsed since we saw them, or even though we have never seen them,—we need not be surprised, that the same active faculty should be able, when uncontrolled by the will and judgement, and but partially assisted by the memory, to raise up a series of images in succession, and thus to create an ideal world, and various ideal transactions, in the mind. But in cases of divine interference the ideas are most probably suggested by a spiritual being. In whatever way we attempt to account for the manner, in which our powers of mind and body perform their functions in dreaming, we can, at least, apply to useful purposes the imperfect knowledge, which we have been able to acquire concerning this series of phenomena. Our dreams are affected by the state of our health, by the manner in which we have passed the preceding day, by our general habits of life, by the hopes which we most fondly indulge, and the fears which prevail most over our fortitude when awake. From recollecting our dreams, therefore, we may learn to correct many improprieties in our conduct; to refrain from bodily exercises, or from meats and drinks that have unfavourable effects on our constitution; to resist, in due time, evil habits that are stealing upon us; and to guard against hopes and fears which detach us from our proper concerns, and unfit us for the duties of life. Instead of thinking what our dreams may forebode, we may with much better reason reflect by what they have been occasioned, and look back to those circumstances in our past life, to which they are owing. The sleep of innocence and health is sound and refreshing; their dreams delightful and pleasing. A distempered body, and a polluted or perturbed mind, are haunted in sleep with frightful, impure, and unpleasing dreams.

DREIN, in the military art, a trench made to draw the water out of a moat, which is afterwards filled with hurdles and earth, or with fascines, or bundles of rushes and planks, to facilitate the passage over the mud.

DRENGFURTH,

DRENGFURTH, a town of Prussia, in the province of Na-
tangen, 44 miles S. E. of Königsberg.

DRENTE, a district of Batavia, in the department of the
Yssel.

DRENTELBURG, or **TRENTELBURG**, a town of Ger-
many, in the circle of the Upper Rhine, 18 miles N. N. W. of
Cassel.

DREPANE, or **DREPANUM**, in ancient geography, a town
of Bithynia, situated between the Sinus and Astacenus and the
Bosphorus Thracius; called Helenopolis by Constantine, in hon-
our of his mother.

DREPANE, the ancient name of Corcyra, from the curvity of its
figure, resembling a sickle.

DREPANUM, the name of three ancient towns, viz. 1. on
the Arabic Gulf, on the side of Egypt: 2. on the N. side of
Crete, between Cydonia and the Sinus Amphinallus: 3. on the
W. side of Cyprus.

DRESDEN, the capital of the late electorate of Saxony, in
Germany, 75 miles N. W. of Prague. Lon. 13. 50. E. Lat. 51.
10. N.

DRESSING, in surgery. The apparatus of dressing consists
of dossils, tents, plasters, compresses, bandages, bands, ligatures,
and strings. See **SURGERY**.

DREUX, a town of France, in the department of Eure and
Loire, 48 miles W. of Paris. Lon. 1. 27. E. Lat. 48. 44. N.

DREYE, or **DREIHE**, a town of Germany, in the circle of
Westphalia, and county of Hoya, 5 miles S. S. E. of Bremen.

DREYEN, a small island of Denmark, in the Little Belt, 3
miles S. W. of Middelfahrt.

DREYSELHAUSEN, a town of Germany, in the circle of
the Lower Rhine, 5 miles N. W. of Bingen.

DRIESSEN, or **DRESNO**, a town of Germany, in the New
Marche of Brandenburg, 90 miles E. N. E. of Berlin.

DRIFT, in mining, a passage cut out under the earth betwixt
shaft and shaft, or turn and turn; or a passage or way wrought
under the earth to the end of a meer of ground, or part of a
meer.

DRIFT, in navigation, the angle which the line of a ship's mo-
tion makes with the nearest meridian, when she drives with her
side to the wind and waves, and is not governed by the power of
the helm: it also implies the distance which the ship drives on
that line. A ship's way is only called drift in a storm; and then
when it blows so vehemently as to prevent her from carrying any
sail, or at least restrains her to such a portion of sail, as may be
necessary to keep her sufficiently inclined to one side, that she
may not be dismasted by her violent labouring produced by the
turbulence of the sea.

DRIFT-SAIL, a sail used under water, veered out right a-head
by sheets, as other sails are. It serves to keep the ship's head
right upon the sea in a storm, and to hinder her driving too fast in
a current.

DRILL, or **DRILL-BOX**, a name given to an instrument for
sowing land in the new method of horse-hoeing husbandry. See
HUSBANDRY.

DRILL-SOWING, a method of sowing grain or seed of any kind,
so that it may all be at a proper depth in the earth, which is ne-
cessary to its producing healthful and vigorous plants. For this
purpose a variety of drill-ploughs have been invented and recom-
mended; but from the expence attending the purchase, and the
extreme complication of their structure, there is not an instrument
of that kind, as yet discovered, that is likely to be brought into
general use. This method, however, is greatly recommended in
the Geographical Essays. See **HUSBANDRY**.

DRINKING, is one of the animal functions, essential to the
proper solution and digestion of food. Although the proportion
of liquid to that of dry, or solid food, cannot be precisely ascer-
tained; yet, if the constant secretion of fluids be laid down as the
basis of this computation, we should, perhaps, drink double the
quantity of the solid provisions we daily consume. Nevertheless,
even this proportion is but too often exceeded, merely to please
the artificial cravings of a corrupted palate. Thus, we no longer
drink with a view to quench thirst only, but at certain hours of
the day, whether we are naturally inclined, or not. Nay, we
frequently meet with sots in beer, ale, spirits, wine, punch, and
even tea. Excessive drink, however, though it distend and op-
press the stomach, and thus impede digestion, is not nearly so per-

nicious as gluttony, unless the former be attended with intoxica-
tion. It however impoverishes the whole mass of the blood, by
rendering it too thin and watery; so that relaxation of the urinary
and other canals, at length, general debility of the system, are its
necessary concomitants. On the contrary, too little drink dis-
poses persons of a sedentary life to indigestion; because many par-
ticles of solid food are, for want of dilution, passed unassimilated
through the alimentary canal; and the blood becomes viscid, and
inert in its circulation. The active and laborious should, there-
fore, drink more than the idle or phlegmatic; and either of these
more in summer than in winter, to supply the great loss of hu-
mours exhaled by insensible perspiration. Persons, whose natural
appetite is not depraved in consequence of irregular living, may
easily regulate the due proportion of their drink to that of dry ali-
ment; as, to them, thirst will be the safest guide. But those in-
dividuals who have become slaves to the libations of Bacchus, are
unfortunately deprived of this beneficent instinct, which is the
privilege even of irrational animals. If the moral turpitude of
committing excess in drinking, affords no argument to induce the
habitual votary to abstain from such pernicious practice, we shall
only add, that he will sooner or later feel the effects of it in pain-
ful and lingering sickness. To a reflecting mind, it affords matter
of just surprize, how so many persons of worth and character,
while sober, can devote themselves to a custom which they can-
not but abhor in their friends. For the sake of a momentary gra-
tification of the palate, wines and spirits are indiscriminately swal-
lowed, and especially by those whose age, labours, and merit in
society, often entitle them to neither. Immense quantities of va-
luable grain by Nature designed for the support of the poor and
indigent, are annually converted into liquid fire, or more properly,
poison! Where is the philanthropist, in our Imperial Senate,
who possesses virtue and influence sufficient to stem the torrent of
so extensive a system of mischief? After this involuntary digres-
sion, we shall only observe, that large potations are, at all times,
and in every constitution, improper; that they are particularly
injurious when indulged in previously to the taking of food, and
especially before dinner; that all beverage is more pernicious to
the healthy in a warm, than in a cold state; that the human sto-
mach should never be inundated with immoderate quantities of
drink at one time; and that the most natural drink, and the most
conducive to health, without exception, is pure water.

DRINO, a river of European Turkey, formed by the junction
of the two following:

DRINO BIANCA, or **WHITE DRINO**, which rises near Rechla,
on the borders of Dalmatia; and

DRINO, NERO, or **BLACK DRINO**, which rises in a lake near
Akrida; joining the Drino Bianca, it takes the name of Drino
only, and runs into the Adriatic, about 8 miles S. W. of Alessio,
forming a bay at its mouth, called The Gulf of Drino.

DRIVERS, among sportsmen, a machine for driving pheasant
pows, consisting of good strong ozier wands, such as the basket-
makers use, set in a handle, and twisted or bound with small oziers
in two or three places. With this instrument the sportsman drives
the young pows into his nets. See the next article.

DRIVING, among sportsmen, a method of taking pheasant
pows. The sportsman having found out the haunts of these birds,
and fixed his nets there, he calls upon them together by a pheasant
call, imitating the voice of the dam; after this he makes a noise
with his driver, which will make them run a little way forward in
a cluster; and this he repeats till he has made sure of them, by
driving them into his nets.

DRIVING, in metallurgy, is said of silver, when, in the opera-
tion of refining, the lead being burnt away, the remaining copper
rises upon its surface in red fiery bubbles.

DRIVING, in the sea language, is said of a ship, when an anchor
being let fall will not hold her fast, nor prevent her sailing away
with the wind or tide. The best help in this case is to let fall
more anchors, or to veer out more cable; for the more cable she
has out, the safer she rides. When a ship is a hull, or a-try, they
say she drives to leeward.

DROGHEDA, or **TREDAH**, a town of Ireland, in the pro-
vince of Leinster and county of Lowth, 5 miles W. of the Irish chan-
nel, and 23 N. of Dublin. Lon. 6. 1. W. Lat. 51. 53. N.

DROGHEDA BAY, a bay of the Irish Sea, on the coast of Louth,
Ireland.

DROIT, [*jus*, Lat.] signifies right or law, of which some dis-
tinguish

tinguish six kinds, 1. *Jus recuperandi*, right of recovery. 2. *Jus entrandi*, right of entering. 3. *Jus habendi*, right of having. 4. *Jus retinendi*, right of retaining. 5. *Jus percipiendi*, right of receiving. 6. *Jus possidendi*, right of possessing.

DROIT is also the highest writ of all other real writs, and takes its name of a writ of right, from the greatest regard being shewn to it; and as it has the most assured and final judgement. There are several sorts of these writs used in our law, as *droit de avowson*, *droit de dower*, *droit de garde*, *droit patent*, *droit rationabili parte*, and *droit sur disclaimer*.

DROITWICH, a town of Worcestershire in England, noted for excellent white salt made from the salt springs in its neighbourhood. It is 6 miles E. N. E. of Worcester.

DRÔME, a river of France, which runs through the department so named from it, into the Rhone.

DROME, a department of France, formed out of part of the late province of Dauphiné. It is bounded on the N. and N. E. by the department of Isère; on the E. by that of the Upper Alps; on the S. by that of the Mouths of the Rhone, and on the W. by the Rhone itself. Valence is the capital.

DROMEDARY. See **CAMELUS**.

DROMO, a small island in the Archipelago.

DROMORE, a town of Ireland, in the county of Down, 17 miles E. of Armagh, and 15 S. W. of Belfast.

DRONE, in music, the largest tube of the bag-pipe; the office of which is to emit one continued deep note, as an accompanying bass to the air or tune played on the smaller pipes.

DRONE. See **BEE**.

DRONFIELD, a town of Derbyshire, 6 miles N. of Chesterfield, and 28 N. of Derby.

DRONTHEIM, a town of Norway, formerly the capital, and the usual residence of the kings; situated on a gulf of the North sea. It is 270 miles N. W. of Stockholm. Lon. 11. 9. E. Lat. 63. 26. N.

DRONTHEIM, or **DRONTHEIM HUSS**, a province of Norway, N. of Bergen, extending from S. to N. about 500 miles along the coast of the Northern Ocean, and from the ocean on the W. to the mountains that separate it from Sweden on the E.

DROPS, in medicine, a liquid remedy, the dose of which is estimated by a certain number of drops.

DROPS, in meteorology, small spherical bodies which the particles of fluids spontaneously form themselves into when let fall from any height. This spherical figure, the Newtonian philosophers demonstrate to be the effect of corpuscular attraction; for, considering that the attractive force of one single particle of a fluid is equally exerted to an equal distance, it must follow, that other fluid particles are on every side drawn to it, and will therefore take their place at an equal distance from it, and consequently form a round superficies. See **ATTRACTION**, **FLUIDITY**, **HYDROSTATICS**, **RAIN**, and **PHYSICS**.

DROPSY, [*hydrops*, Latin; whence anciently *hydropisy*, thence *dropisy*, *dropsy*,] a collection of water in the body, from too lax a tone of the solids, whereby digestion is weakened, and all the parts stuffed. See **MEDICINE**.

DROPPWORT, in botany. See **SPIRÆA**.

DROSENDORF, a town of Germany, in the archduchy of Austria, 46 miles N. W. of Vienna.

DROSERA, **ROS SOLIS**, or **SUN-DEW**, a genus of the pentagynia order, and pentandria class of plants; natural order, *Gruinales*. Calyx quinquefid; petals five; capsule unilocular, quinquevalved at top; seeds very numerous. There are nine species, which grow naturally in boggy places, in many parts of the kingdom. They are named sun-dew from a very striking circumstance in their appearance. The leaves, which are circular, are fringed with hairs, supporting small drops or globules of a pellucid liquor like dew, which continue even in the hottest part of the day, and in the fullest exposure to the sun. The whole plant is acrid, and sufficiently caustic to erode the skin; but some ladies know how to mix the juice with milk, so as to make it an innocent and safe application to remove freckles and sun-burn. The juice that exudes from it unmixed, will destroy warts and corns. The plant has the same effect upon milk, that the common butter-wort has; and like that too is supposed to occasion the rot in sheep.

DROWNING, the act of being suffocated by a total immersion in water. In some respects, there seems to be a great simi-

larity between the death occasioned by immersion in water, and that by strangulation, suffocation by fixed air, apoplexies, epilepsies, sudden faintings, violent shocks of electricity, or even violent falls and bruises. Physicians, however, are not agreed with regard to the nature of the injury done to the animal system, in any or all of these accidents. It is indeed certain, that in all the cases abovementioned, particularly in drowning, there is very often such a suspension of the vital powers, as to us hath the appearance of a total extinction of them; while yet they may be again set in motion, and the person restored to life, after a much longer submersion, than hath been generally thought capable of producing absolute death. The length of time during which a person may remain under water, without being drowned, is very unequal, in different individuals; and depends as much on the temperature of the water as on the particular constitution of the subject: in general, however, there is less prospect of recovery, after having continued fifteen minutes in a watery grave. In such cases, death ensues from impeded respiration, and the consequent ceasing of the circulation of the blood, by which the body loses its heat, and, with that, the activity of the vital principle. Dr. Goodwyn justly observes, that the water produces all the changes which take place in drowning, only indirectly, by excluding the atmospheric air from the lungs, as they admit but a very inconsiderable quantity of fluid to pass into them, during immersion. Hence we shall find, in the progress of this inquiry, that inflation of the lungs is one of the principal means of restoring life. Before we describe the various methods and instruments that have been successfully adopted, for recovering drowned persons, it will be useful to advert (on the plan of Dr. STURVE) to those circumstances which deserve to be duly weighed, previously to any active measures being taken on such unfortunate occasions: 1. The season and weather; 2. Length of time the person has continued under water; 3. The state of his mind when the accident happened: whether he was intoxicated, frightened, &c.; 4. Constitution of the body, and whether he was in a state of perspiration; 5. The height from which he fell, and whether his head plunged foremost; 6. Depth of the water; whether it was cold or warm, sea, or river water, and how he was dressed. Lastly, 7. The manner in which he was taken out, whether by the legs, and without receiving any injury, or by instruments; and whether he was rolled about in a tub, or what other methods were pursued for his restoration. Few improvements appear to have been made in the treatment of the drowned, since this important branch of medical science was first discussed, in a popular manner, by the late Dr. Tissot; yet the names of Cullen, Goodwyn, Cogan, Hawes, and Coleman, in Britain, as well as those of Unzer, Reimarus, and Struve, in Germany, deserve to be respectfully mentioned; from their various publications, and especially of the two last mentioned, we shall briefly state the principal rules of conduct to be observed, with respect to persons in that deplorable situation.

DROWNING, SYMPTOMS OF APPARENT DEATH BY.—Coldness; paleness of the whole body; the lips of a livid hue; the mouth either open or firmly closed; the tongue blue, swelled and protruded; the eye-lids closed, the eyes turned, and their pupils dilated; the face swelled and blue; the lower belly hard and inflated. The first signs of returning animation are, convulsive starting of the muscles of the face, or feet; motion of the eye-lids; a spasmodic shivering of the body.

Treatment.—1. After having been carefully taken out of the water by the arms, so as to prevent the least injury to the head and breast, the body ought to be carried to the nearest house (if possible, in a bier, as represented in Plate LIX. fig. 10.) with the head somewhat raised; or, in fine warm weather, the resuscitative process may with more advantage be performed in the open air, especially in sun-shine. 2. When the subject is deposited, the upper part of the body should be supported half-sitting, with the head inclining towards the right side. 3. The clothes are to be taken off without delay, but with the greatest precaution; as violent shaking of the body might extinguish the latent spark of life. 4. The mouth and nose must be cleansed from the mucus and froth, by means of a feather dipped in oil. 5. The whole body should now be gently wiped and dried with warm flannel cloths, then covered with blankets, feather-beds, hay, straw, &c. In cold or moist weather, the patient is to be laid on a mattress or bed, at a proper distance from the fire, or in a room moderately heated; but

but in the warm days of summer, a simple couch is sufficient. 6. If the patient be very young, or a child, it may be placed in bed between two persons, to promote natural warmth. See also the warming machine, delineated in Plate LIX. fig. 11, and described below. 7. In situations where the bath cannot be conveniently procured, bladders filled with lukewarm water should be applied to different parts of the body, particularly to the pit of the stomach; or a warming-pan wrapped in flannel gently moved along the spine; or aromatic fomentations frequently and cautiously repeated. 8. As the breathing of many persons in an apartment would render the air impure, and thus retard, or even prevent the restoration of life, not more than five or six assistants should be suffered to remain in the room where the body is deposited.

Stimulants generally employed.—1. Moderate friction with soft, warm flannel, at the beginning, and gradually increased by means of brushes dipped in oil, till pulsations of the heart are perceptible. 2. Inflation of the lungs, which may be more conveniently effected by blowing into one of the nostrils, than by introducing air into the mouth. For the former purpose, it is necessary to be provided with a wooden pipe, fitted at one extremity for filling the nostril, and at the other for being blown into by a healthy person's mouth, or for receiving the muzzle of a pair of common bellows, by which, the operation may be longer continued. At first, however, it will always be more proper to introduce the warm breath from the lungs of a living person, than to commence with cold atmospheric air. During this operation, the other nostril and the mouth should be closed by an assistant, while a third person gently presses the chest with his hands, as soon as the lungs are observed to be inflated. For a more effectual method of alternately introducing fresh air into the lungs, and expelling that which is rendered noxious, or unfit for respiration, see the description of fig. 8. Plate LIX, which follows these observations. 3. Stimulating clysters, consisting of warm water and common salt; or a strong solution of tartar emetic; or decoctions of aromatic herbs; or six ounces of brandy, should be speedily administered. We do not consider injections of the smoke of tobacco, or even clysters of that narcotic plant, in all instances safe or proper. 4. Let the body be gently rubbed with common salt, or with flannels dipped in spirits; the pit of the stomach fomented with hot brandy; the temples stimulated with spirit of hartshorn; and the nostrils occasionally tickled with a feather. 5. Persons of a very robust frame, and whose skin after being dried, assumes a rigid and contracted surface, may be put into the sub-trepid bath, of about 65°, which must be gradually raised to 75 or 80°, of Fahrenheit's scale, according to circumstances; or the body carried to a brewhouse, and covered with warm grains for three or four hours; but these expedients generally require medical assistance. 6. Violent shaking and agitation of the body by the legs and arms, though strongly recommended, and supposed to have often forwarded the recovery of children and boys, appears to us a doubtful remedy, which can be practised only in certain cases. 7. Sprinkling the naked body of a drowned person with cold water; submitting it to the operation of a shower-bath, or the sudden shocks of the electric fluid; as well as whipping it with nettles, administering emetics, and blood-letting—are desperate expedients, which should be resorted to only after the more lenient means have been unsuccessfully employed. It is, however, a vulgar and dangerous error, to suppose that persons apparently dead by immersion under water, are irrecoverable, because life does not soon re-appear: hence we seriously entreat those who are thus employed in the service of humanity, to persevere for three or four hours at least, in the application of the most appropriate remedies above described; for there are many instances recorded, of patients who recovered, after they had been relinquished by all their medical and other assistants.

Treatment on the return of life.—As soon as the first symptoms of that happy change become discernible, additional care must be taken to cherish the vital action, by the most soothing means. All violent proceedings should, therefore, be immediately abandoned, no farther stimulants applied, nor even the ears of the patient be annoyed by loud speaking, shouting, &c. At that important crisis, moderate friction only is requisite. And, if the reviving person happen to be in the bath, he may either remain there, provided his sensation be easy and agreeable, or be removed to a

comfortable bed after being expeditiously dried with warm flannels: fomentations of aromatic plants may then be applied to the pit of the stomach; bladders filled with warm water, placed to the left side; the soles of the feet rubbed with salt; the mouth cleared of froth and mucus, and a little white wine, or a solution of salt in water, dropped on the tongue. But all strong stimulants, such as powerful electric shocks, strong odours of volatile salts, &c. are at this period particularly injurious. Lastly, the patient, after resuscitation, ought to be for a short interval resigned to the efforts of Nature, and left in a composed and quiescent state: as soon as he is able to swallow, without compulsion or persuasion, warm wine, or tea, with a few drops of vinegar, instead of milk, or gruel, warm beer, and the like, should be given in small doses frequently repeated. Having stated the leading particulars to be attended to, in the practical treatment of persons who are on the eve of suffering from aquatic suffocation, we shall accompany them with a few directions, addressed to those humane assistants who often fall victims for want of due precaution in the execution of their benevolent design. As many fatal accidents happen to individuals who wish to rescue others in danger of being drowned, especially when the former are unskilful in the useful art of swimming, which ought to be learnt at an early period of life, we think it our duty to remind the reader of the two excellent contrivances already described under the articles AIR-JACKET, and BAMBOE HABIT. Every family dwelling on the banks of lakes or rivers, or near ponds, ought to be always provided with two or three such useful articles, to serve in cases of emergency; as it will generally be too late to procure them on the spur of the occasion. In Plate LIX, is given a representation of instruments employed for recovering the bodies of drowned persons; and also for their restoration from drowning.

Fig. 5. A forked instrument with blunt points, for making a superficial search after the drowned body, and sounding the particular situation in which it lies.

Fig. 6. A ladder with a long, jointed handle.

Fig. 7. An extractor, or a linked pair of tongs, which in the plate appears closed; but, on immersing it into water, opens by its own weight, as well as by the sliding down of the iron ring *o* from the part marked *x*, to that of *u*. It may again be closed, by pulling the double rope fastened to the ring *o*, which is thus shifted upward from *u* to *x*: by means of expanding the iron arms *nn*, which are likewise connected with this ring, the mouth or flaps of the instrument *rr*, may be shut: and to prevent their opening till required, the two ropes are firmly tied round the iron bolt *ss*; in which situation they remain till the body is extracted.

Fig. 8. A pair of bellows with two separate bags, so contrived that by opening them, when applied to the nostrils or mouth of a patient, one bag will be filled with common air, and the other with the air extracted from the lungs; and, by shutting them again, pure atmospheric air will be introduced into those organs, and that drawn out, consequently discharged into the room. Thus, the artificial breathing may be continued, while the other operations on the surface of the body are carried on; which could not be conveniently done, if the muzzle of a common pair of bellows were introduced into the nostril. *a*. Is an intermediate board, but which admits of no communication between the two bags. In the external board of each side, there is the usual hole, marked *b*, provided with a valve; and the cylindrical part through which the air is expelled in common bellows, is here soldered to a copper box, within which two other valves are applied to the tubes conducting the air. The cover *d* of this box, which may be unscrewed by means of an interposed leather ring, is almost of the shape of a funnel, to the neck of which is fastened a flexible tube *e*, made of varnished silk cloth, and a spiral wire that forms the cavity. To the extremity of this tube is attached a small ivory pipe *f*, the front of which may either be tubular and round, for introducing it into the nostril: or flat like the top-piece of a clarinet, if it be intended for the mouth. The valves consist of stiffened taffety, and are so arranged, that the corresponding ones stand in an inverted order. If, therefore, both bags of the bellows be expanded, two of the valves open themselves towards the internal part of the machine: one of these is fixed to one of the side-boards, but the other is within the box, on the mouth of the conducting tube belonging to the opposite bag of the bellows. By this contrivance, the air enters both bags of the bellows at the same

same time, and is, on compression, again expelled by means of two other valves, which open from within toward the external parts. Both bags of the bellows terminate below the valve in one principal tube of communication; because, though the action of both bellows is simultaneous, the stream of air, conformably to the arrangement before pointed out, can only enter, and escape, alternately. In using this machine, the small ivory pipe is applied either to one of the nostrils, or put into the mouth: in the former case, the other nostril and the mouth must be closed; in the latter, both nostrils. When the bellows are set in action, one of the bags receives a column of atmospheric air through its valve; while the other, by means of its flexible tube and its valve, extracts a portion of air from the lungs. But, if the bellows are again shut, one of the bags parts with the impure gas drawn out of the pulmonary vessels; and the second conveys pure atmospheric air to the organs of respiration. By properly repeating this alternate process, the patient may again be enabled to exercise the important function of breathing. As, however, a precipitate and irregular method of proceeding might be productive of injury, this delicate operation ought to be performed by persons who are acquainted with the mechanism of respiration. In some cases, where the patient has, for a considerable time, lain under water, or was afterwards neglected for want of due assistance, it would be desirable to introduce into his lungs oxygen, or pure vital air, instead of that of the common atmosphere; as the latter is generally more or less corrupted on such occasions by the breath of many persons in the same room. For this purpose may be used a bladder, marked *g*, which is provided with a cock and pipe fitted or screwed to the board of the inspiring valve and bag of the bellows. If, therefore, after opening the cock, the machine is set in motion, it will extract the pure air contained in the bladder, and, on the subsequent compression of the bellows, force it into the lungs of the patient.

Fig. 9. A machine for injecting the smoke of tobacco by way of clyster, in those desperate cases which require the application of this remedy. It consists of a pair of bellows, to the muzzle of which is fitted a metal box, *a*, provided with a ring, in the middle of which it may be unscrewed, and again closed, after being filled with tobacco, and set on fire: the pipe *c* of the flexible tube *b*, is introduced into the fundament; and thus, by means of the bellows *d*, the smoke is forced into the rectum.

Fig. 10. A bier of wicker work, in the form of a slanting, oblong basket, for conveying the body of the drowned, in a posture somewhat raised. This simple contrivance has the advantage, that the water may easily run off, while the patient is carried: and, as many unfortunate persons are materially injured by rough treatment, before they arrive at a house of reception, so that their recovery is thus often frustrated, we recommend the universal adoption of this useful implement.

Fig. 11. The warming machine of block tin, or other metal, was originally invented by Mr. Harvey, of London, who suggested it to our Royal Humane Society, and it was subsequently improved by M. Braasch, an ingenious mechanic, of Hamburg. Its object is to procure a uniform degree of warmth, throughout the apparatus, in the most expeditious manner, by filling the hollow, or double bottom and sides of the whole implement, with boiling water. *a* is the body of the machine, seven feet long, and made of solid pieces of block-tin, to prevent the necessity of soldering them, and consequently the formation of iron-rust: it rests on two wooden legs *ff*, and may be easily carried by the handles *g g*. The water is poured in through both funnels *d d*, in order to warm it more speedily; and each of these is provided with a stopper as suspended on a chain, represented in the figure with a view to prevent, if necessary, too sudden evaporation and cooling of the water: *h* is the intermediate space between the two metallic plates, producing a vacuum of $2\frac{1}{2}$ inches, in which the fluid is diffused over the whole machine; *b* is a wooden desk to support the head of the patient, and to protect it from the immediate contact with the heated parts; but, on the opposite end of the machine, there is an enlarged intermediate space *c*, for holding such a quantity of water and vapours as will procure an additional, or at least a more permanent, degree of heat towards the lower extremities, than to the trunk of the body. For discharging the water, when it is not wanted, or changing it when too cold, there is a cock at *e*. The hollow sides of this machine are about twelve inches high; and in order to ensure an uniform warmth,

the body apparently dead should be placed on a straw mattress, and tucked in with blankets. A pailful of water is required to fill the whole machine, as a smaller quantity would warm the sides only for a short time, by means of the vapour. It deserves to be remarked, that this ingenious contrivance may also be used for a warm bath; for which purpose, the inner space in which the body lies, should be supplied with water.

DRUGGET, in commerce, a stuff sometimes all wool, and sometimes half wool half thread, sometimes corded, but usually plain. Those that have the woof of wool, and the warp of thread, are called threaded druggets; and those wrought with the shuttle on a loom of four marches, as the serges of Mouti, Beauvois, and other like stuffs, corded, are called corded druggets. As to the plain, they are wrought on a loom of two marches, with the shuttle, in the same manner as cloth, camlets, and other like stuffs, not corded.

DRUIDS, DRUIDES, or DRUIDÆ, the priests or ministers of religion among the ancient Gauls, Britons, and Germans. Some derive the word from the Hebrew דְּרוּשִׁים *drussim*, which they translate *contemplatores*. Picard, (Celtopæd. lib. ii. p. 58,) believes the druids to have been thus called from Drui, or Dryius, their leader, the fourth or fifth king of the Gauls, and father of Saron or Naumes. Pliny, Salmasius, Vigenere, &c. derive the name from δρυς, an oak; on account of their inhabiting, or frequenting, and teaching in forests; or because, they never sacrificed but under the oak. But it is hard to imagine how the druids should come to speak Greek. Menage derives the word from the old British *drus*, demon, or magician; Borel, from the Saxon *dry*, magician; or from the old British *dru* or *derw*, "oak," whence he takes the Greek word δρυς to be derived; which is the most probable supposition. Gorop. Becanus, lib. i. takes drui to be an old Celtic and German word, formed from *trouis* or *truwis*, "a doctor of the truth and the faith;" which etymology Vossius acquiesces in. The druids were the first and most distinguished order among the Gauls and Britons; they were chosen out of the best families; and the honours of their birth, joined with those of their function, procured them the highest veneration among the people. They were versed in astrology, geometry, natural philosophy, politics, and geography; they were the interpreters of religion, and the judges of all affairs indifferently. Whoever refused obedience to them was declared impious and accursed. We know but little as to their peculiar doctrines; only that they believed the immortality of the soul; and, as is generally supposed, the metempsychosis; though a late author makes it appear highly probable they did not believe this last, at least not in the sense of the Pythagoreans. Their chief settlement in Britain was in the isle of Anglesey, the ancient Mona, which was well stored with spacious groves of their favourite oak. They were divided into several classes, viz. the vacerri, bard, eubages, semnothi or semnothei, and saronide. The vacerri are held to have been the priests; the bard, the poets; the eubages, the augurs; and the saronide, the civil judges and instructors of youth. As to the semnothei, who are said to have been immediately devoted to the service of religion, it is probable they were the same with the vacerri. Strabo, however, (lib. iv. p. 197,) only distinguishes three kinds, hardi, vates, and druids. The hardi were the poets; the vates, *vates* (probably the vacerri,) were the priests and naturalists; and the druids, besides the study of nature, applied themselves to morality. Diogenes Laertius assures us, that the druids were the same among the ancient Britons with the philosophers among the Greeks; the magi among the Persians; the gymnosophists among the Indians; and the Chaldeans among the Assyrians. Their garments were remarkably long; and, when employed in religious ceremonies, they wore a white surplice. They generally carried a wand in their hands; and wore a kind of ornament encased in gold about their necks, called the druid's egg. Their necks were also decorated with gold chains, and their hands and arms with bracelets: they wore their hair very short, and their beards remarkably long. The druids had one chief, or arch-druid, in every nation, who acted as high-priest. He had absolute authority over the rest; and commanded, decreed, punished, &c. at pleasure. At his death he was succeeded by the most considerable among his survivors; and, if there were several pretenders, the matter was ended by an election, or else decided by arms. The druids presided at sacrifices, and other ceremonies; and had the direction of every thing relating to religion. The

British and Gaulish youth were instructed by them. The children of the nobility, Mela tells us, they carried into caves, or the most desolate parts of forests, and kept them there, sometimes for 20 years, under their discipline. They were here instructed in the motion of the heavens, and the course of the stars; the magnitude of the heavens and the earth; the power and wisdom of the gods, the metempsychosis, immortality, &c. They preserved the memory and actions of great men in their verses, which they never allowed to be wrote down, but made their pupils get them by heart. In their common course of learning, they are said to have taught them 24,000 such verses. Thus their doctrines appeared more mysterious by being unknown to all but themselves; and having no book to recur to, they were the more careful to fix them in their memory. They worshipped the Supreme Being under the name of Esus, or Hesus, and the symbol of the oak; and had no other temple than a wood or a grove, where all their religious rites were performed. Nor was any person admitted to enter that sacred recess, unless he carried with him a chain, in token of his absolute dependence on the Deity. Indeed, their whole religion originally consisted in acknowledging, that the Supreme Being, who made his abode in these sacred groves, governed the universe; and that every creature ought to obey his laws, and pay him divine homage. They considered the oak as the emblem, or rather the peculiar residence, of the Almighty; and accordingly chaplets of it were worn both by the druids and people, in their religious ceremonies; the altars were strewed with its leaves, and encircled with its branches. The fruit of it, especially the mistletoe, was thought to contain a divine virtue, and to be the peculiar gift of heaven. It was, therefore, sought for on the sixth day of the moon with the greatest earnestness and anxiety; and when found was hailed with such raptures of joy, as almost exceeds imagination to conceive. As soon as the druids were informed of this fortunate discovery, they prepared every thing ready for the sacrifice under the oak, to which they fastened two white bulls by the horns; then the arch-druid, attended by a prodigious number of people, ascended the tree dressed in white; and with a consecrated golden knife, or pruning-hook, cropped the mistletoe, which he received in his sagum or robe, amidst the rapturous exclamations of the people. Having secured this sacred plant, he descended the tree; the bulls were sacrificed; and the Deity invoked to bless his own gift, and render it efficacious in those distempers in which it should be administered. The consecrated groves, in which they performed their religious rites, were fenced round with stones, to prevent any person's entering between the trees, except through the passages left open for that purpose, and which were guarded by some inferior druids, to prevent any stranger from intruding into their mysteries. These groves were of different forms; some quite circular, others oblong, and more or less capacious, as the votaries in the districts to which they belonged were more or less numerous. The area in the centre of the grove was encompassed with several rows of large oaks set very close together. Within this large circle were several smaller ones surrounded with large stones; and near the centre of these smaller circles, were stones of a prodigious size and convenient height, on which the victims were slain and offered. Each of these being a kind of altar, was surrounded with another row of stones, the use of which cannot now be known, unless they were intended as cinctures to keep the people at a convenient distance from the officiating priest. Suetonius, in his life of Claudius, assures us the druids sacrificed men; and Mercury is said to be the god to whom they offered these victims. Diodorus Siculus, (lib. vi.) observes it was only upon extraordinary occasions they made such offerings; as, to consult what measures to take, to learn what should befall them, &c. by the fall of the victim; the tearing of his members, and the manner of his blood gushing out. Augustus condemned the custom, and Tiberius and Claudius punished and abolished it.

DRUM, TYMPANUM, is a marshal musical instrument in form of a cylinder, hollow within, and covered at the two ends with vellum, which is stretched or slackened at pleasure by the means of small cords and sliding knots. It is beat upon with sticks. Some drums are made of brass, but they are commonly of wood. There are several beats of the drum, as assembly, chamade, reveillé, retreat, &c.

DRUMS, KETTLE, are two sorts of large basons of copper or brass, rounded in the bottom, and covered with vellum or goat-skin, which is kept fast by a circle of iron, and several holes fast-

ened to the body of the drum, and a like number of screws to screw up and down. They are much used among the horse, as also in operas, oratorios, concerts, &c.

DRUM OF THE EAR, an elliptical, concave, membrane, composed of two or three lamellæ, and furnished with many blood-vessels. It is situated obliquely inwards, about the middle part of the ear, at the extremity of the auditory passage. See **ANATOMY**.

DRUMLANRIG, a town of Scotland, in Dumfries-shire, 13 miles N. of Dumfries.

DRUMMER, or **DRUM**, he that beats the drum; of whom each company of foot has one, and sometimes two. Every regiment has a drum-major, who has the command over the other drums. They are distinguished from the soldiers by clothes of a different fashion: their post, when a battalion is drawn up, is on the flanks, and on march it is betwixt the divisions.

DRUMMOND, WILLIAM, a Scotch poet, was the son of sir John Drummond, of Hawthornden, and born there in 1585. He was destined for the law, but Parnassus had more charms for him than the courts. In his retirement at Hawthornden he wrote several beautiful poems; but the death of a lady, to whom he was about to be married, affected him so much, that he went abroad, where he remained some years, and then returned to his own country. He wrote his History of the Seven Kings of the name of James, and several pieces to promote peace and union in that turbulent time. He died in 1649, leaving a widow and three children. His works were printed in folio at Edinburgh in 1711.

DRUNKENNESS. See **INTOXICATION**.

DRUPA, in botany, a species of pericarpium, or seed-vessel, which is succulent or pulpy, has no valve or external opening like the capsule and pod, and contains within its substance a stone or nut. The cherry, plum, peach, apricot, and all other stone-fruit are of this kind. The stone or nut, which in this sort of fruit is surrounded by the soft pulpy flesh, is a kind of ligneous or woody cup, which contains a single kernel or seed. The almond is a drupa, so is the seed-vessel of the elm-trees and the genus rumphia, though far from being pulpy or succulent; the first and third are of a substance like leather, the second like parchment. The same may be said of the walnut, the pistachia nut, guetterda, quisqualis, jack-in-a-box, and some others. The seeds of the elm, schrehera, stagellaria, and the mango-tree, are not contained in a stone. The seed-vessel of burr-reed is dry, shaped like a top, and contains two angular stones.

DRUSENHEIM, a small town of France, in the department of the Lower Rhine, 5 miles S.E. of Haguenau.

DRUSSES, or **DRUZES**, a remarkable nation in Palestine, inhabiting the environs of Mount Lebanon. In the year of the Hejira 386 (A.D. 996), the third caliph of the race of the Fatemites, called Hakem B' Amr-Ellah, succeeded to the throne of Egypt at the age of eleven years. He was one of the most mad and capricious princes of whom history has preserved the name, not excepting Caligula himself. He caused the first caliphs, the companions of Mohammed, to be cursed in the mosques, and afterwards revoked the anathema: he compelled the Jews and Christians to abjure their religion, and then permitted them to resume it. He prohibited the making of slippers for women, to prevent them from coming out of their houses. He burnt one-half of the city of Cairo for his diversion, while his soldiers pillaged the other. He prohibited the pilgrimage to Mecca, fasting, and the five prayers; and at length carried his madness so far as to desire to pass for God himself! He ordered a register of those who acknowledged him to be so, and the number amounted to 16,000! This impious pretension was supported by a false prophet, named Mohammed Ben Ismael, who came from Persia into Egypt, and taught that it was not necessary to fast or pray, to practise circumcision, to make the pilgrimage to Mecca, or observe festivals; that the prohibition of pork and wine was absurd; and that marriage between brothers and sisters, fathers and children, was lawful. To ingratiate himself with Hakem, he maintained that the caliph was God himself incarnate; and instead of his name *Hakem B' Amrellah*, which signifies governing by the order of God, he called him *Hakem B' Amr-Eh*, governing by his own order. Unluckily for the prophet, his new god had not the power to protect him from the fury of his enemies, who slew him in a tumult almost in the arms of the caliph, who was himself massacred soon after on mount Mokattam, where he, as he said, had held conversation

with angels. The death of these two chiefs did not stop the progress of their opinions: a disciple of Mohammed Ben Ismael, named Hamzah Ben Ahmud, propagated them with indefatigable zeal in Egypt, in Palestine, and along the coast of Syria, as far as Sidon and Berytus. His proselytes being persecuted by the sect in power, they took refuge in the mountains of Lebanon, where they were better able to defend themselves; at least it is certain, that, shortly after this era, we find them established there, and forming an independent society. The difference of their opinions disposes them to be enemies; but the urgent interest of their common safety forces them to allow mutual toleration, and they have always appeared united, and have jointly opposed, at different times, the Crusaders, the sultans of Aleppo, the Mamelukes, and the Ottomans. The conquest of Syria by the latter, made no change in their situation. Selim I., on his return from Egypt, meditating no less than the conquest of Europe, disdained to waste his time before the rocks of Lebanon. Soliman II. his successor, incessantly engaged in important wars, either with the knights of Rhodes, the Persians, the kingdom of Yemen, the Hungarians, the Germans, or the emperor Charles V. had no time to think of the Druzes. Emboldened by this inattention, and not content with their independence, they frequently descended from their mountains to pillage the Turks. The pachas in vain attempted to repel their inroads; their troops were invariably routed or repulsed. And it was not till 1588, that Amurath III. wearied with the complaints made to him, resolved, at all events, to reduce these rebels, and had the good fortune to succeed. His general, Ibrahim Pacha, marched from Cairo, and attacked the Druzes and Maronites, with so much address and vigour as to force them into their strong holds in the mountains. Dissention took place among their chiefs, of which he availed himself to exact a contribution of upwards of one million of piasters, and to impose a tribute which has continued to the present time. The opinions of Mohammed ben Ismael may be regarded as the substance of the religion of the Druzes. They practise neither circumcision, nor prayers, nor fasting; they observe neither festivals nor prohibitions. They drink wine, eat pork, and allow marriage between brothers and sisters, though not between fathers and children. From this we may conclude, that the Druzes have properly no religion; but one class of them must be excepted, whose religious customs are very peculiar. Those who compose it are to the rest of the nation what the initiated were to the profane; they assume the name of Okkals, which means spiritualists, and bestow on the vulgar the epithet of Djahel or ignorant; they have various degrees of initiation, the highest orders of which require celibacy. These are distinguishable by the white turban they affect to wear, as a symbol of their purity; and so proud are they of this supposed purity, that they think themselves sullied by even touching a profane person. If such eat out of their plate, or drink of their cup, they break them; and hence the custom so general in this country of using vases with a sort of cock, which may be drank out of without touching them with the lips.

DRUSIUS, JOHN, a Protestant writer of great learning, born at Oudenarde in Flanders, in 1555. He was designed for the study of divinity; but his father being outlawed, and deprived of his estate, they both retired to England, where the son soon became professor of the oriental languages at Oxford: but upon the pacification of Ghent, they returned to their own country, where Drusius was also appointed professor of the oriental languages. From thence he removed to Friesland, where he was admitted Hebrew professor in the university of Franeker; the functions of which he discharged with great honour till his death in 1616. His works shew him to have been well skilled in Hebrew; and the states-general employed him in 1600 to write notes on the most difficult passages in the Old Testament, with a pension of 400 florins a-year: but being frequently disturbed in this undertaking, it was not published till after his death. He held very great correspondence with the learned: for besides letters in Hebrew, Greek, and other languages, there were found 2300 Latin letters among his papers.

DRUSIUS, JOHN, the son of the preceding, was a prodigy of learning. He was born at Franeker in 1588; began to learn Latin and Hebrew at five years old; at seven explained the Hebrew Psalter so exactly, that he astonished a Jewish teacher at Leyden; at nine he could read the Hebrew without points, and add them where wanted. He spoke Latin as readily as his native tongue, and could make himself understood in English. At twelve, he

wrote in Hebrew extempore, in verse and prose, like the Jews. At seventeen he made a speech in Latin to king James I. in the midst of his court, and was admired by all present. He was endowed with a lively genius, a strong memory, a solid judgement, an agreeable temper, and an indefatigable ardour for study; and was also extremely pious. He died of the stone in 1609, aged 21, at the house of Dr. W. Thomas, dean of Chichester, who gave him a considerable salary. He left several works; many letters and verses in Hebrew; Notes on Solomon's Proverbs, &c. and digested into alphabetical order Elias Levita's Nomenclator; to which he added the Greek words, and had begun some translations.

DRUYN, DREVIN PETRI, or GRAND DREVIN, a town of Africa, on the Ivory coast. Lon. 4. 5. W. Lat. 5. N.

DRYADES, or DRYADS, in the heathen mythology, a sort of deities, who, the ancients believed, inhabited groves and woods. They differed from the Hamadryades; these latter being attached to some particular tree, with which they were born, and with which they died; whereas the Dryads were goddesses of trees and woods in general. See **HAMADRYADES**.

DRYANDRIA, in botany, a genus of the dioecia monadelphia class and order: natural order Tricocceæ. Calyx two-leaved; corolla five-petaled; or, calyx five-leaved, resembling a corolla, surrounded by a two or three-leaved calycle; stamina nine; fruit three or four grained. There is but one species, viz. *D. cordata*.

DRYAS, in botany, a genus of the polygynia order, and icosandria class: natural order Senticoseæ. Calyx from five to ten cleft; petals from five to eight; seeds hairy, tailed. It has two species.

DRYDEN, JOHN, one of the most eminent English poets of the seventeenth century, descended of a genteel family in Huntingdonshire, born in that county at Oldwinkle, 1631, and educated at Westminster school under Dr. Busby, from whence he was elected to Trinity college, Cambridge, in 1650. He proceeded to the degree of M.A. and in 1657 removed to London, where he wrote, the year following, an elegy on the death of Cromwell; and at the Restoration he complimented the king by a poem, entitled *Astrea Redux*. In 1666 he married lady Elizabeth Howard, daughter of the earl of Berkshire. On the establishment of the Royal Society, he was chosen one of the first members. In 1662 appeared his first play, called *The Wild Gallant*. Soon after the fire of London he engaged with the king's theatre for an annual stipend, on condition of furnishing a certain number of plays in each year. On the death of sir William Davenant he was nominated poet laureat; and about the same time he obtained the place of historiographer royal, with a salary of 200*l.* a year, and a butt of wine. His eminence as a dramatic writer exposed him to the envy of several rival wits; the duke of Buckingham held him up to ridicule in the character of Bays in *The Rehearsal*; and the earl of Rochester being offended at some things in an Essay on Satire, written jointly by our poet and lord Mulgrave, caused the former to be cudgelled by some hired ruffians as he came home from a coffee-house. At the accession of James II. Dryden turned Roman Catholic, and, like most converts, endeavoured to defend his new faith at the expence of the old one, in a poem, called *The Hind and Panther*, which was admirably answered by Prior and Montague in *The Country Mouse and the City Mouse*. At the Revolution he lost his posts, and was succeeded by Shadwell, whom Dryden satirised under the name of Mac Flecknoe. Mr. Dryden's circumstances had never been affluent; but now being deprived of this little support, he found himself reduced to the necessity of writing for mere bread. From this period, therefore, he was engaged in works of labour as well as genius, viz. in translating the works of others; and to this necessity our nation stands indebted for some of the best translations extant. In the year he lost the laurel, he published the life of St. Francis Xavier from the French. In 1693, came out a translation of Juvenal and Persius; in the first of which he had a considerable hand, and of the latter the entire execution. In 1695, was published his prose version of Fresnoy's *Art of Painting*; and the year 1697 gave the world that translation of Virgil's works entire, which still does, and perhaps ever will, stand foremost among the attempts made on that author. The petite pieces of this eminent writer, such as prologues, epilogues, epitaphs, elegies, songs, &c. are too numerous to specify here, and too much dispersed to direct

rect the reader to. The greatest part of them, however, are to be found in a collection of miscellanies, in 6 vols. 12mo. His last work is his Fables, which consist of many of the most interesting stories in Homer, Ovid, Boccace, and Chaucer, translated or modernized in the most elegant and poetical manner; together with some original pieces, among which is that amazing ode on St. Cecilia's day, which, though written in the very decline of the author's life, and at a period when old age and distress conspired, as it were, to damp his poetic ardor, and clip the wings of fancy, yet possess so much of both, as would be sufficient to have rendered him immortal had he never written a single line besides. His critical prefaces are admirable; and his poetry is correct, harmonious, and strong, particularly his satires. As a dramatic writer he chiefly excelled in tragedy. He had three sons: Charles became usher of the palace to pope Clement XI. and was drowned in 1704; John wrote a comedy, called The Husband his own Cuckold; and Henry entered into a religious order abroad. Though Dryden was addicted to astrology, yet the story of his predicting the fate of his eldest son is not true. He died in 1700, and was buried in Westminster abbey; but had no monument erected to him for several years; to which Mr. Pope alludes in his epitaph intended for Mr. Rowe, in this line,

Beneath a rude and nameless stone he lies.

In a note upon which we are informed, that the tomb of Mr. Dryden was erected by this hint, by Sheffield, duke of Buckingham, to which was originally intended this epitaph:

This Sheffield rais'd.—The sacred dust below
Was Dryden once; the rest, who does not know?

Which was since changed into the plain inscription now upon it, viz.

J. DRYDEN,
Natus Aug. 9, 1631.
Mortuus Maii 1, 1701.

Johannes Sheffield, dux Buckinghamiensis, fecit.

DRYPIS, in botany, a genus of the trigynia order, and pentandria class of plants; natural order, Caryophyllææ. Calyx quinque-dentate; petals five; opening at the capsule as if cut round horizontally; monospermous. It has only one species, a biennial, native of Italy and Barbary.

DRY ROT, a disease incident to timber used for building, such as flooring-boards, joists, wainscoting, &c. Dr. Darwin is of opinion, that the dry-rot may be entirely prevented, by soaking the timber first in lime-water, till it has absorbed as much of it as possible, and, after it has become dry, immersing it in a weak solution of vitriolic acid in water, which he supposes will not only preserve it from decay for many centuries (if it be kept dry), but also render it less inflammable; a circumstance that merits considerable attention in constructing houses. In the Transactions of the Society for the Encouragement of Arts, we meet with the following account of the cause of the dry rot in timber, and the method of preventing it, communicated by Mr. Batson, of Limehouse. He observes, that the dry rot having taken place in one of his parlours, to such a degree as to require the pulling down part of the wainscot every third year, and perceiving that it arose from a damp, stagnated air, and from the moisture of the earth, he determined, in the month of June, 1783, to build a narrow closet next the wall through which the moisture came to the parlour. This expedient had the desired effect. But, though the rot in the parlour was totally stopped, the evil soon appeared in the closet, where fungi of a yellow colour arose in various parts. In the autumn of the year 1786 the closet was locked up about ten weeks: on opening it, numerous excrescences were observed about the lower part; a white mould was spread by a plant resembling a vine, or sea-weed; and the whole of the inside, china, &c. was covered with a fine powder of the colour of brick-dust. On cleaning out the closet, it was discovered that the disease had affected the wood so far as to extend through every shelf, and the brackets that supported them. In the beginning of the year 1787, he determined to strip the whole closet of lining and floor, not to leave a particle of the wood behind, and also to dig, and take away, about two feet of the earth in depth, and leave the walls to dry, so as to destroy the roots or seeds of the evil. When, by time, the

admission of air, and good brushing, it had become properly dry and cleansed, he filled it, of sufficient height for the joists, with anchor-smith's ashes, because no vegetable will grow in them. The joists being sawed off to their proper lengths, and fully prepared, they and their plates were well charred, and laid upon the ashes; particular directions being given, that no scanting or board might be cut or planed in the place, lest any dust or shavings might drop among the ashes. The flooring-boards being very dry, he caused them to be laid close, to prevent the dust getting down, which perhaps, in the course of time, might bring on vegetation. The framing of the closet was then fixed up, having all the lower panels let in, to be fastened with buttons only, so that, if any vegetation should arise, the panels might with ease be taken out and examined. In some situations it might be expedient and necessary to take out a greater depth of earth; and where ashes can be had from a foundry, they may be substituted for those of anchor-smiths; but house ashes are by no means to be depended upon. At the expiration of seven years from the period of making this experiment the wainscot was removed, and the flooring-boards also taken up, when they were found entirely free from any appearance of the rot: two pieces of wood (yellow fir) which had been driven into the wall as plugs, without being previously charred, were alone affected with this disease.

DSAPRONG, or **CHAPARANG**, a considerable city of Asia, in Thibet. Lon. 78. 42. E. Lat. 34. 0. N.

DSJABEL, an island in the Red Sea, lying N. of the Straits of Babel-Mandel.

DSJEI, a district of Arabia, in Sana, wherein there are a great number of schiechs.

DSJEI, the capital of the above district. Lon. 43. 50. E. Lat. 14. 37. N.

DSJEDSJAL, a sect of Mohammedan Arabs, chiefly inhabiting Mecran, a maritime province of Persia. "Its first author, says Mr. Niebuhr, was a venerable old man, who was found by some wood-cutters shut up in the middle of a tree, and having a book in his hand." This miraculous origin, he was informed of at Maskat, but "each sect," he adds, "tells ridiculous stories of the others to bring them into contempt."

DSJENNED, a town of Yemen. Lon. 43. 49. E. Lat. 15. 39. N.

DSJESAN, a town of Yemen, on the coast of the Red Sea. Lon. 41. 50. E. Lat. 16. 45. N.

DSJIDDA, or **JIDDA**, a city and sea-port of Arabia, in the country of Hedsjas, near Mecca, in the dominions of the sherriffe of Mecca.

DSJILIBAT, and **DSJIMUM**, two districts of Arabia, in the country of Hedsjas, on the coast of the Red Sea.

DSJOBEL ALA, a town of Arabia, in the province of Yemen. Lon. 43. 38. E. Lat. 15. 47. N.

DSJOBLA, an ancient city of Arabia, in the province of Yemen. Its streets are paved, which is not common in Arabia. Lon. 44. 10. E. Lat. 13. 55. N.

DSJERHAMIE, a tribe of Arabs who inhabit between Rama and Jerusalem.

DSJOF, a large province of Arabia, in the country of Yemen, extending S. from Nedsjeran to Hadramaut, and E. from Hachid-u-Bekil to the Desert, by which Yemen is separated from Oman. It is full of sandy and desert plains.

DSJULFAR, a principality of Arabia, in the province of Oman, called also Seer.

DUAL, [*dualis*, Lat.] expressing the number two.

DUBKI, a town of Russia, in the government of Petersburg; on the Gulph of Finland, 16 miles N. N. W. of Petersburg.

DUBLIN, a county of Ireland, in the province of Leinster; bounded on the N. by the county of Meath, on the E. by the Irish sea, on the S. by the county of Wicklow, and on the west by those of Meath and Kildare. It is 25 miles long from N. to S. and from nine to 16 broad; and contains about 142,050 acres. The soil is fertile.

DUBLIN, the metropolis of Ireland, the second city in his majesty's dominions, and esteemed the fifth for magnitude in Europe, is situated in the province of Leinster, and county of Dublin, at the bottom of a large bay. The river Liffey, which here disembogues itself into the ocean, divides the town nearly into two equal parts. Dublin is situated 60 miles W. of Holyhead in Wales; and 330 N. W. of London. Lon. 6. 6. W. Lat. 53. 20. N. Dublin is a place

a place of great antiquity. It was anciently confined to the S. side of the Liffey. In the 10th century, after the fortifications of Dublin were repaired by the Ostmen, the walls of the city, including those of the castle, did not occupy more than an Irish mile. Ptolemy, who flourished about A. D. 140, says, it was anciently called *Aschled*. In 155, Alpinus, whose daughter Auliana was drowned in the Liffey, changed the name from *Aschled* to *Auliana*. It was afterwards named *Dublana*, and Ptolemy calls it *Eblana*. *Dublana*, (whence *Dublinum* and *Dublin*;) is evidently derived from *Dub-leana*, the place of the black harbour or lake, or rather the lake of the sea; the bay of Dublin being frequently so called. The city has had a variety of names. The Irish call it *Drom-choll-coil*, "the brow of a hazle wood." In 181, Eogan king of Munster being on a royal tour, paid a visit to this place, which was then called *Atha Cliath-Dubb-Line*, "the passage of the ford of hurdles over the black pool." This city has two cathedrals, 18 parish-churches, two chapels, of ease, 15 Roman catholic chapels, six meeting houses for presbyterians, one for anabaptists, four for methodists, two for quakers, a church for French Calvinists, a Danish and a Dutch church, and a Jewish synagogue.

DUBLIN, a town of Pennsylvania, in Philadelphia county; 10 miles N. E. of Philadelphia.

DUBOS, JOHN BAPTIST, a learned and ingenious French author, born at Beauvais in 1670. He finished his studies at Paris, and was intrusted with the management of several important affairs in Italy, England and Holland. At his return to Paris, he got a prebendary: afterwards he had a pension of 2000 livres, and the abbey of Notre Dame at Recons, near Beauvais. He died at Paris, when perpetual secretary of the French academy, on the 23d March, 1742. His principal works are, 1. *Critical Reflections on Poetry and Painting*, 3 vols. 12mo. 2. *A Critical History of the French Monarchy in Gaul*, 2 vols. 4to.

DUCALS, letters patent granted by the senate of Venice, or wrote in the name of the senate, to foreign princes: so named because the name of the doge or duke was prefixed to them.

DUCAS, a learned Greek, who wrote a history of what passed under the last emperors of Constantinople, till the ruin of that city. This work, which is esteemed, was printed at the Louvre in 1649, with the Latin translation, and notes of Bouillaud.

DUCAT, a coin chiefly of gold. The origin of ducats is assigned by Procopius, to Longinus, governor of Italy; who, revolting against the emperor Justin II., made himself duke of Ravenna, and called himself *Exarcha*, i. e. without lord or ruler; and, to shew his independence, struck pieces of money, of very pure gold, in his own name, and with his own stamp, which were called *ducati*. Du Cange affirms, that the first ducats were struck in the duchy of Apulia. The chief gold ducats are, the single and double ones of Venice, Florence, Genoa, Germany, Hungary, Poland, Sweden, Denmark, Flanders, Holland, and Zurich. The double ducats weigh from five pennyweights 17 grains, to five pennyweights 10 grains; and the single in proportion. The Spaniards have no ducats of gold; and the silver one, with them, is no real species, but only a money of account like our pound. It is equivalent to 11 rials. The silver ducats of Florence serve there for crowns.

DUCATOON, a silver coin, struck chiefly in Italy, though there are also Dutch and Flemish ducatoons. They are valued at about 4s. 8d. or 4s. 10d. according to the rate of bullion. There is also a gold ducatoon, current principally in Holland: it is equivalent to 20 florins, at the rate of 1s. 11½d. the florin.

DUCENARIUS, [*Δουκηνάριος*,] in antiquity, an officer of the Roman army, who had the command of 200 men.

DUCENTESIMA, in antiquity, a tax of the 200th penny, exacted by the Romans.

DUCES TECUM, in law, a writ that commands a person to appear in the court of chancery, and bring with them certain writings, evidences, or other things, which the court is inclined to view.

DUCK, in ornithology. See **ANAS** and **DECOY**. This fowl is furnished with a peculiar structure of vessels about the heart, which enables it to live a considerable time under water, as is necessary for it in diving.

DUCKING, a sort of marine punishment, inflicted by the French before the revolutions on those who had been convicted of desertion, blasphemy, or sedition. It was thus performed: The

criminal was placed astride of a short thick batten, fastened to the end of a rope, which passed through a block hanging at one of the yard-arms. Thus fixed, he was hoisted suddenly up to the yard, and the rope being slackened at once, he was plunged into the sea. This was repeated several times conformably to the sentence against the culprit, who had also several cannon-shot fastened to his feet. A gun was also fired to advertise the other ships of the fleet, that their crews might become spectators.

DUCKING is also a penalty which veteran sailors pretend to have a right to inflict on those who, for the first time, pass the tropic of Cancer, the equator, or the straits of Gibraltar, in consequence of their refusal or incapacity to pay the usual fine levied on such occasions.

DUCKSFOOT. See **PODOPHYLLUM**.

DUCK UP, is a phrase used at sea by the steer's man, when the main-sail, fore-sail, or sprit-sail, hinder his seeing to steer by a land-mark: upon which he calls out, *duck up* the clew-lines of these sails, that is, hale the sails out of the way. When a shot is made by a chace-piece, if the clew of the sprit-sail hinder the sight, they call out, *duck up*, &c.

DUCT, **DUCTUS**, in general, denotes any tube or canal. It is much used by anatomists, who mention the adipose ducts, the thoracic, or chyliiferous duct; the excretory ducts of the glands; the hepatic duct; the salival ducts; the lachrymal ducts; the *ductus communis choledochus*, &c. Their use is to convey the fluids of the body to the parts to which they belong. See **ANATOMY**.

DUCTILITY, in physics, a property possessed by certain solid bodies, which consists in their yielding to percussion or pressure, and in receiving different forms without breaking. Some bodies are ductile in all circumstances. Such are metals, particularly gold and silver. Other bodies are ductile only when heated to a sufficient degree; such as wax and other substances of that kind, and glass. Other bodies, particularly some kinds of iron, called by the workmen *red-hot*, brass, and some other metallic mixtures, are ductile only when cold, and brittle when hot. The degrees of heat requisite to produce ductility in bodies of the first kind, vary according to their different natures. The great ductility of some bodies, especially gold, is very surprising: the gold-beaters and wire-drawers furnish us with abundant proofs of this property; they every day reduce gold, into lamellæ inconceivably thin, yet without the least aperture or pore discoverable, even by the microscope: a single grain of gold may be stretched under the hammer, into a leaf that will cover a house, and yet the leaf remain so compact as not to transmit the rays of light, nor even admit spirit of wine to transude. Dr. Halley took the following method to compute the ductility of gold: he learned from the wire-drawers, that an ounce of gold is sufficient to gild, that is, to cover or coat, a silver cylinder of forty-eight ounces weight, which cylinder may be drawn out into a wire so very fine, that two yards shall weigh only one grain; and consequently ninety-eight yards of the same wire, only forty-nine grains: so that a single grain of gold here gilds ninety-eight yards; and of course, the ten-thousandth part of a grain is here above one-third of an inch long. And since the third part of an inch is yet capable of being divided into ten less parts visible to the naked eye, it is evident that the hundred thousandth part of a grain of gold may be seen without the assistance of a microscope. Proceeding in his calculation, he found, at length, that a cube of gold, whose side is the hundredth part of an inch, contains 2,433,000,000 visible parts; and yet, though the gold with which such wire is coated, is stretched to such a degree, so intimately do its parts cohere, that there is not any appearance of the colour of the silver underneath. Mr. Boyle, examining some leaf-gold, found that a grain and a quarter in weight took up an area of fifty square inches; supposing therefore the leaf divided by parallel lines 100th part of an inch apart, a grain of gold will be divided into five hundred thousand minute squares, all discernible by a good eye: for the same author shews, that an ounce of gold drawn out in wire would reach 155 miles and a half. But Mr. Reaumur has carried the ductility of gold to a still greater extent. What is called gold-wire, every body knows, is only a silver one gilt. The cylinder of silver, covered with leaf-gold, they draw through the hole of an iron, and the gilding still keeps pace with the wire, stretch it to what length they can. Now Mr. Reaumur shews, that in the common way of drawing gold-wire, a cylinder of

silver twenty-two inches long, and fifteen lines in diameter, is stretched to 1,163,520 feet, or is 634,692 lines longer than before, which amounts to about ninety-seven leagues. To wind this thread on silk for use, they first flatten it, in doing which it stretches at least one-seventh farther, so that the twenty-two inches are now 111 leagues: but in the flattening, instead of one-seventh, they could stretch it one-fourth, which would bring it to 120 leagues. This appears a prodigious extension, and yet it is nothing to what this gentleman has proved gold to be capable of.

DUCTILITY OF GLASS. We all know that, when well penetrated with the heat of fire, the workmen can figure and manage glass like soft wax; but what is most remarkable, it may be drawn, or spun out, into threads exceedingly long and fine. Our ordinary spinners do not form their threads of silk, flax, or the like, with half the ease and expedition as the glass-spinners do threads of this brittle matter. We have some of them used in plumes for children's heads, and divers other works, much finer than any hair, and which bend and wave like hair with every wind. Nothing is more simple and easy than the method of making them. There are two workmen employed; the first holds one end of a piece of glass over the flame of a lamp; and, when the heat has softened it, a second operator applies a glass hook to the metal thus in fusion; and, withdrawing the hook again, it brings with it a thread of glass, which still adheres to the mass: then, fitting his hook on the circumference of a wheel about two feet and a half in diameter, he turns the wheel as fast as he pleases: which, drawing out the thread, winds it on its rim; till, after a certain number of revolutions, it is covered with a skain of glass-thread. The mass in fusion over the lamp diminishes insensibly: being wound out like a clue of silk upon the wheel; and the parts, as they recede from the flame, cooling, become more coherent to those next to them, and this by degrees: the parts nearest the fire are always the least coherent, and, of consequence, must give way to the effort the rest make to draw them towards the wheel. The circumference of these threads is usually a flat oval, being three or four times as broad as thick: some of them seem scarcely bigger than the thread of a silkworm, and are surprisingly flexible. If the two ends of such threads are knotted together, they may be drawn and bent, till the aperture, or space in the middle of the knot, does not exceed one-fourth of a line, or one forty-eighth of an inch, in diameter. Hence M. Reaumur advances, that the flexibility of glass increases in proportion to the fineness of the threads: and that, probably, had we but the art of drawing threads as fine as a spider's web, we might weave stuffs and cloths of them for wear. Accordingly, he made some experiments this way; and found that he could make threads fine enough, viz. as fine, in his judgement, as spider's thread, but he could never make them long enough to do any thing with them.

DUBERSTADT, a town of Germany, in the circle of Lower Saxony, 40 miles N. E. of Cassel. Lon. 10. 12. E. Lat. 51. 41. N.

DUDLEY, a town of England, in the county of Worcester, 10 miles W. of Birmingham.

DUEL, a single combat, at a time and place appointed, in consequence of a challenge. This custom came originally from the northern nations, among whom it was usual to decide all their controversies by arms. Both the accuser and accused gave pledges to the judges on their respective behalf; and the custom prevailed so far amongst the Germans, Danes, and Franks, that none were excused from it but women, sick people, cripples, and such as were under 21 years of age or above 60. Even ecclesiastics, priests, and monks, were obliged to find champions to fight in their stead. The punishment of the vanquished was either death, by hanging or beheading; or mutilation of members, according to the circumstances of the case. Duels were at first admitted not only on criminal occasions, but on some civil ones for the maintenance of rights to estates, and the like: in latter times, however, before they were entirely abolished, they were restrained to these four cases. 1. That the crime should be capital. 2. That it should be certain the crime was perpetrated. 3. The accused must by common fame be supposed guilty. And, 4. The matter not capable of proof by witnesses.

DUEL, at present, is used for single combat on some private quarrel; and must be premeditated, otherwise it is called a *Ren-counter*. If a person is killed in a duel, both the principals and seconds are guilty, whether the seconds engage or not. See

VOL. II.—NO. 68.

MURDER. It is also a very high offence to challenge a person either by word or letter, or to be the messenger of a challenge. See *LAW*.

DUET, in music, a composition expressly written for two voices or instruments, with or without a bass and accompaniments. In good duets the execution is pretty equally distributed between the two parts, and the melodies so connected, intermingled, and dependent on each other, as to lose every effect when separated, but to be perfectly related and concinnous when heard together.

DUEREN, or **DUREN**, a handsome town of Germany, in the duchy of Juliers, 12 miles S. S. E. of Juliers.

DUERSTADT, or **WYCK DE DUERSTADT**, a town of Batavia, in the department of the Rhine, and late province of Utrecht, 11 miles from Utrecht.

DUGDALE, Sir **WILLIAM**, an eminent English historian, antiquarian, and herald, born in Warwickshire in 1605. He was introduced into the herald's office by Sir Christopher Hatton; and ascended gradually through all the degrees, until he became garter principal king at arms. His chief work is the "*Monasticum Anglicanum*," in 3 vols. folio; containing the charters and descriptions of all the English monasteries, adorned with engravings: in the former of which works he was assisted by Mr. Roger Dodsworth. Nor are his "*Antiquities of Warwickshire*" less esteemed. He wrote likewise the *History of St. Paul's Cathedral*; a *History of Embanking and Draining*; a *Baronage of England*; and completed the second volume of Sir Henry Spelman's *Councils*, with a second part of his *Glossary*. He died in 1686. His son, John, was Norroy king at arms, and published a *Catalogue of English Nobility*. His daughter Elizabeth married the famous Elias Ashmole.

DUGINSKOI, a cape of Russian Siberia, in the sea of Ochotskoi. Lon. 167. E. Lat. 59. 15. N.

DUILLIA LEX, the **DUILLIAN LAW**, a Roman law, enacted by M. Duillius, a tribune, A. U. C. 304. It made it a capital crime to leave the Roman people without its tribunes, or to create any new magistrate without a sufficient cause. There was another Duillian law in 392, regulating the interest to be paid for money lent.

DUILLIUS NEPOS, **CATUS**, a Roman consul, the first who obtained a victory over the naval power of Carthage, A. U. C. 492. He took 50 ships and was honoured with a naval triumph, the first that ever appeared at Rome. The senate rewarded his valour by permitting him to have music playing, and torches lighted, at the public expence, every day while he was at supper. There were some medals struck in commemoration of this victory; and there still exists a column at Rome, which was erected on the occasion.

DUINA, or **DUNA**, a river of Russia, which rises from a lake, 16 miles N. E. of Toropetz, and falls into the Baltic at Riga.

DUINO, or **DOINO**, or **TYBEIN**, a sea-port town of Germany, in Carniola, 8 miles N. W. of Trieste.

DUISBURG, a town of Germany, in Westphalia. Lon. 6. 49. E. Lat. 51. 30. N.

DUKE, **DUX**, was originally a Roman dignity, denominated a *duendo*, leading or commanding. Accordingly, the first dukes, *duces*, were *ductores exercituum*, commanders of armies. Under the later emperors, the governors of provinces during war were intitled *duces*. In after-times the same denomination was also given to the governors of provinces in time of peace. The first governor under the name of duke was a duke of the *Marchia Rhetica*, or *Grisons*, whereof mention is made in Cassiodorus; and there were afterwards 13 dukes in the eastern empire, and 12 in the western. The Goths and Vandals, upon their over-running the provinces of the western empire, abolished the Roman dignities wherever they settled. But the Franks, &c. to please the Gauls, who had long been used to that form of government, made it a point of politics not to change any thing therein: and accordingly they divided all Gaul into duchies and counties; and gave the names, sometimes of dukes, and sometimes of counts, *comites*, to the governors thereof. In England, during the time of the Saxons, Camden observes, the officers and commanders of armies were called dukes, *duces*, after the ancient Roman manner, without any addition. After the Conqueror came in, the title lay dormant till the reign of Edward III. who created his son Edward, first called the *Black Prince*, duke of Cornwall; which has ever since

been the peculiar inheritance of the king's eldest son during the life of his father; so that he is *dux natus*, non creatus. After him there were more made, in such manner as that their titles descended to their posterity. They were created with much solemnity, per cincturam gladii, cappæque, & circuli aurei in capite impositionem. However, in the reign of queen Elizabeth, A. D. 1572, the whole order became utterly extinct; but it was revived about 50 years afterwards by her successor, in the person of George Villiers duke of Buckingham. Though the French retained the names and form of the ducal government, yet under their second race of kings there were scarce any dukes: but all the great lords were called counts, peers, or barons; excepting, however, the dukes of Burgundy and Aquitaine, and the duke of France, which was a dignity Hugh Capet himself held, corresponding to that of *maire de palais*, or king's lieutenant. The modern dukes retain nothing of their ancient splendor but the coronet on their escutcheon, which is the only mark of their departed sovereignty. They are created by patent cincture of the sword, mantle of state, imposition of a cape, and coronet of gold upon the head, and a verge of gold in their hand. The eldest sons of dukes are by the courtesy of England styled marquisses, though they are usually distinguished by their father's second title, whether it be marquis or earl; and the younger sons lords, with the addition of their Christian name, as Lord James, Lord Thomas, &c. and they take place of viscounts though not so privileged by law. A duke has the title of grace; and being writ to, he is styled, in the herald's language, most high, potent and noble prince. Dukes of the blood royal are styled most high, most mighty, and illustrious princes.

DUKE is also the title of a sovereign prince, without the quality of king. Such were the Dukes of Holstein, of Wirtemberg, &c. The word is borrowed from the modern Greeks who call *doucas* what the Latins called *dux*. There were also two sovereigns who bore the title of grand-duke; as the grand duke of Tuscany, and the grand duke of Muscovy, now called the czar or emperor of Russia. The title of great duke belongs to the heir apparent of Russia; that of arch-duke to all the sons of the house of Austria, and that of arch-duchess to all the daughters.

DUKE, among Hebrew grammarians, is an appellation given to a species of accents answering to our comma.

DUKE-DUKE, a quality given in Spain to a grandee of the house of Sylva, on account of his having several duchies, from the uniting of two considerable houses in his person.

DULCIFYING, in chemistry, is the sweetening any matter impregnated with salts, by frequently washing it in pure water.

DULCIGNO, a town of Albania, 15 miles S. W. of Scutari.

DULCIMER, [*dolcimello*], a musical instrument played by striking the brass wires with little sticks.

DULDERSTADT, a town of Germany, in the duchy of Brunswick, 15 miles E. of Gottingen.

DULIA, [*δουλια*], an inferior kind of adoration.

DULL, in the manege. The marks of a dull horse, called by the French, *marquis de ladre*, are white spots round the eye and on the tip of the nose, upon any general colour whatsoever. Though some take these spots for signs of stupidity, it is certain they are great marks of the goodness of a horse; and the horses that have them are very sensible and quick upon the spur.

DULVERTON, a town in Somersetshire seated on a branch of the Ex; 24 miles E. of Barnstaple.

DUMARING, a town of the island of Borneo, on the E. coast. Lon 117. 30. E. Lat. 2. 10 N.

DUMBNESS, [*דום* he was silent,] is the privation, or want, of the faculty of speech. This unfortunate defect proceeds chiefly from total and native deafness; if it arise from a deficiency in the organs necessary for uttering sounds, it is always incurable. Several instances, however, have occurred of persons born deaf, who have been taught to speak distinctly; to read, write, understand arithmetic, &c. The most eminent teachers of the dumb in this country, were,

1. Dr. Wallis, who, in the 61st number of the Philosophical Transactions, gives an account of two persons he had taught to speak; and, in the 245th number of the same work, his method is explained.

2. Mr. Thomas Braidwood, late of Edinburgh, who is perhaps the first who ever brought this surprising art to any degree of perfection. He began with a single pupil in 1764, and since that period, has taught great numbers of people born deaf to speak

distinctly; to read, to write, to understand figures, the principles of religion and morality, &c. and even to make a rapid progress in those useful branches of education. Mr. Braidwood's principal difficulty, after he had discovered this art, was to make the people believe in the practicability of it. He advertised in the public papers; he exhibited his pupils to many noblemen and gentlemen; still he found the generality of mankind unwilling to believe him. The first thing in Mr. Braidwood's method is, to teach the pupil to pronounce the simple sounds of the vowels and consonants. He pronounces the sound of *a* slowly, pointing out the figure of the letter at the same time; makes the pupil observe the motion of his mouth and throat; he then puts a silver instrument, somewhat resembling the shank of a spoon, into the pupil's mouth, depresses or elevates the tongue, and makes him keep the parts in that position; he then lays hold of the out-side of the windpipe, and gives it a kind of squeeze, which it is impossible to describe; all the while he is pronouncing *a*, the pupil is anxiously imitating him, but at first is at a loss to understand what he would have him do. In this manner he proceeds, till the pupil has learned to pronounce the sounds of the letters. He goes on in the same manner to join a vowel and a consonant, till at length the pupil is enabled both to speak and read. That his pupils were taught not only the mere pronunciation, but also to understand the meaning of what they read, was easily ascertained by a conversation with any of them. Of this Mr. Pennant gives a remarkable instance in a young lady of about 13 years of age, who had been some time under the care of Mr. Braidwood. "She readily apprehended (says he) all I said, and returned me answers with the utmost facility. She read; she wrote well. Her reading was not by rote. She could clothe the same thought in a new set of words, and never vary from the original sense. I have forgot the book she took up, or the sentences she made a new version of: but the effect was as follows: Original passage. 'Lord Bacon has divided the whole of human knowledge into history, poetry, and philosophy; which are referred to the three powers of the mind, memory, imagination, and reason.' Version. A nobleman has parted the total or all of man's study or understanding into, An account of the life, manners, religion or customs, of any people or country; verse or metre; moral or natural knowledge; which are pointed to the three faculties of the soul or spirit; the faculty of remembering what is past, thought or conception, and right judgement."

3. Abbé De L'Epee of Berlin who practises a new and different method, equally laborious and successful. He begins his instructions not by endeavouring to form the organs of speech to articulate sounds, but by communicating ideas to the mind by means of signs and characters: to effect this, he writes the names of things; and, by a regular system of signs, establishes a connection between these words and the ideas to be excited by them. After he has thus furnished his pupils with ideas, and a medium of communication, he teaches them to articulate and pronounce, and renders them not only grammarians but logicians. In this manner he has enabled one of his pupils to deliver a Latin oration in public, and another to defend a thesis against the objections of one of his fellow-pupils in a scholastic disputation; in which the arguments of each were communicated to the other, but whether by signs or in writing is not said; for it does not appear that the Abbé teaches his pupils to discern what is spoken, by observing the motion of the organs of speech, which those instructed by Messrs. Braidwoods are able to do with astonishing readiness. There is perhaps no word, says the Abbé, more difficult to explain by signs than the verb *croire*, "to believe." To do this, he writes the verb with its significations in the following manner:

Je crois { Jé dis oui par l'esprit, Je pense que oui.
Jé dis oui par le coeur, J'aime a penser que oui.
Jé dis oui par la bouche.
Je ne vois pas des yeux.

After teaching these four significations, which he does by as many signs, he connects them with the verb, and adds other signs to express the number, person, tense, and mood, in which it is used. If to the four signs, corresponding with the lines above-mentioned, be added that of a substantive, the pupil will write the word *foi*, faith; but, if a sign, indicating a participle used substantively, be adjoined, he will express *la croyance*, belief; to make him write *crovable*, *credible*, the four signs of the verb must be accompanied with one that indicates an adjective terminating in *able*; all these signs are rapidly made, and immediately comprehended.

DUMFRIES, or **DUMFRIES-SHIRE**, a county in the S. of Scotland, comprehending the district of Nithsdale, the Stewartry of Annandale, and the lordship of Eskdale, extending in length from N. W. to S. E. about 60 miles, and about 30 miles in breadth where broadest. It is bounded on the S. W. by Galloway and part of Kyle; on the N. E. by the counties of Roxburgh, Selkirk, and Peebles; on the N. W. by Clydesdale; and on the S. E. by Solway Frith and the marches between Scotland and England.

DUMFRIES, the capital of the above county, a handsome town, situated on a ridge or rising ground, on the N. E. side of the river Nith, 75 miles S. S. W. of Edinburgh. Lon. 4. 25. W. Lat. 55. 8. N.

DUMFRIES, a town of the United States, the capital of Pr. William county, in Virginia.

DUMOSA, [from *dumus*, a bush] bushy plants; the name of the forty-third order in Linnaeus's Fragments of a Natural Method; consisting of a number of shrubby plants, which are thick set with irregular branches, and bushy.

DUN, [*dun*, Saxon,] 1. A colour partaking of brown and black. 2. Dark; gloomy.

DUN, or **BURCH**, the name of an ancient species of buildings, of a circular form, common in the Orkney and Shetland isles, the Hebrides, and northern parts of Scotland. See Plate LIX. fig. 12. The latter term points out the founders, who at the same time bestowed on them their natal name of borg, a defence or castle, a Suedo-Gothic word; and the Highlanders universally apply to these places the Celtic name *dun*, signifying a hill defended by a tower, which plainly points out their use. They are confined to the countries once subject to the crown of Norway. With few exceptions, they are built within sight of the sea, and one or more within sight of the other; so that on a signal by fire, flag, or trumpet, they could give notice of approaching danger, and yield a mutual succour.

DUN, a river in Yorkshire.

DUNAMUND, or **DIAMINTZ**, a town of Riga.

DUNBAR, a royal borough of Scotland, in East Lothian, equidistant from Edinburgh and Berwick upon Tweed, being 27 miles from each.

DUNBARTON, the chieftown of Lenox or Dunbartonshire in Scotland, 58 miles W. of Edinburgh. Lon. 4. 30 W. Lat. 56. 0. N.

DUNBLANE, a town of Scotland 30 miles N. of Edinburgh.

DUNCANNON, a town and fort of Ireland, in Wexford, six miles E. of Waterford.

DUNCAN'S BAY, lies on the N. coast of Jamaica. Lon. 77. 23. W. Lat. 18. 31. N.

DUNDALK, a town of Ireland, in the county of Louth, about 40 miles from Dublin.

DUNDEE, a town of Scotland, in Angus-shire, 40 miles N. of Edinburgh. Lon. 3. 3. W. Lat. 56. 27. N.

DUNEBOURG, a town of Livonia, on the Dwina, 90 miles S. E. of Riga. Lon. 27. 0. E. Lat. 59. 8. N.

DUNEGEL, a fertile island of Ireland, on Baltimore bay, on the coast of Cork.

DUNFERMLINE, a borough of Scotland, in Fifeshire, 15 miles N. W. of Edinburgh. Lon. 3. 27. W. Lat. 55. 12. N.

DUNG. See **HUSBANDRY**.

DUNGALA, **DONGALA**, or **DONKALA**, a kingdom of Africa, in Nubia, seated on both sides of the Nile, but chiefly on the W.

DUNGALA, or **DONGALA**, the capital of the above kingdom. Lon. 30. 35. E. Lat. 21. 0. N.

DUNGANNON, a town of Ireland, the capital of Tyrone, in Ulster. Lon. 6. 39. W. Lat. 54. 38. N.

DUNGARVAN, or **DUNGARVON**, a town of Ireland, in the county of Waterford, 22 miles S. W. of Waterford.

DUNGARVAN BAY, on the coast of Waterford.

DUNGENSESS, a cape on the coast of Kent, eight miles S. by W. of Romney. Lon. 1. 4. E. Lat. 50. 52. N.

DUNGENSESS POINT, a cape in the eastern entrance of the straits of Magellan. Lon. 68. 28. W. Lat. 52. 28. S.

DUNGEON, in fortification, the highest part of a castle built after the ancient mode; serving as a watch-tower, or place of observation; and also for the retreat of a garrison, in case of necessity, so that they may capitulate with greater advantage.

DUNG MEERS, in husbandry, places where soils and dungs

are mixed and digested together. These consist of pits, prepared at the bottom with stone and clay, that they may hold water, on the moisture of the dung. They ought to be so situated, that the sinks and drips of the houses and barns may run into them. Into these are cast refuse fodder, litter, dung, weeds, &c. where they lie and rot together, till the farmer have occasion for them.

DUNKELD, a town of Scotland, in Perthshire, 15 miles N. W. from Perth.

DUNKIRK, a maritime town of France, in the department of the North, 22 miles S. W. of Ostend. Lon. 2. 28. E. Lat. 51. 2. N.

DUNLEER, a town of Ireland, in Louth; seven miles N. of Drogheda, and 30 of Dublin.

DUNMANUS BAY, a bay of the Atlantic, on the S. W. coast of Ireland, in the county of Cork; about 14 miles in length, and from one to three broad: S. of Bantry bay; affording a safe harbour. The mouth of this bay lies in Lon. 9. 30. W. Lat. 51. 20. N.

DUNMORE HEAD, a cape on the W. coast of Ireland, in the county of Kerry. This cape is the most western point in Europe. Lon. 10. 20. W. Lat. 52. 6. N.

DUNMOW, GREAT, a town of Essex, 13 miles N. of Chelmsford, and 40 N. E. of London.

DUNNET HEAD, an extensive promontory on the W. coast of Caithness.

DUNOOSE, a cape on the S. E. coast of the isle of Wight; 51 miles W. of Beachy head. Lon. 1. 11. W. Lat. 50. 33. N.

DUNOIS, a late territory of France in the province of Orleans, and district of Beauce; included in the department of Eure and Loire.

DUNSE, a town of Scotland, in the county of Merse. Lon. 2. 5. W. Lat. 55. 42. N.

DUNS, JOHN, commonly called **DUNS SCOTUS**, a famous Franciscan divine, was born at Dunstane in Northumberland. He was educated at Oxford, from whence he went to Paris, where he acquired a great reputation as a disputant, and was called the "subtile doctor." He opposed the notions of Aquinas, which produced two parties, the Thomists and the Scotists. He died at Cologne in 1308. He was a voluminous writer; his works making 12 vols. folio; as published at Lyons by Luke Wadding, in 1639.

DUNSTABLE, a town in Bedfordshire, 34 miles N. W. of London. Lon. 0. 29. W. Lat. 51. 59. N.

DUNSTAN, Sr. archbishop of Canterbury, was born in 925, in the reign of Athelstan, who gave him lands at Glastonbury, where he founded a monastery. King Edgar made him bishop of Worcester, and in 959 archbishop of Canterbury. The pope confirmed the appointment, and made him his legate. Dunstan extended the papal power in a most arbitrary manner, though opposed by the English clergy, for which he deprived many of their benefices, and placed monks in their room. On the death of Edgar in 975, he placed his son Edward on the throne, who being a minor, Dunstan assumed the regency. Under his successor Ethelred, however, he lost his influence and died of grief in 988.

DUNSTER, a town in Somersetshire; 20 miles N. W. of Taunton. Lon. 3. 41. W. Lat. 51. 13. N.

DUNUM, a Celtic term, denoting a hill or eminence, which often concurs to form the names of towns, to signify their high situation, places of strength or citadels, hills or eminences, being adapted to such structures. See **DUN**.

DUNUM, in ancient geography, a town of Ireland, mentioned by Ptolemy, and supposed to be Down or Down-Patrick. See **DOWN**.

DUNWICH, a town in Suffolk, most of which is destroyed by the encroachments of the sea, and not one church left of eight. It is 30 miles N. E. of Ipswich. Lon. 1. 55. E. Lat. 52. 21. N.

DUO, in music, a song or composition, to be performed in two parts only, one sung, the other played on an instrument, or by two voices. Also when two voices sing different parts, as accompanied with a third, which is a thorough bass. It is seldom that unisons and octaves are used in duos, except at the beginning and end.

DUODECIMA, in music, is the twelfth or the fifth doubled.

DUODENUM, the first of the small guts, so called from its length, which is about twelve fingers breadth. It has its origin at the pilorus, or right orifice of the stomach. See **ANATOMY**.

DUODI, [from *duo*, two, and *dies*, a day, Lat.] the second day of the decade, in the new French distribution of time.

DUPIN, LEWIS ELLIS, a learned doctor of the Sorbonne, and one

one of the greatest critics of his time, especially in ecclesiastical matters, was born at Paris, in 1657. When he published the first volume of his *Bibliothèque Universelle des Auteurs Ecclesiastiques*, in 1686, the liberty, with which he treated some ecclesiastical writers, gave such offence, that M. de Harlay, archbishop of Paris, obliged Dupin to retract many propositions, and suppressed the work. He was nevertheless suffered to continue it, by altering the title from *Bibliothèque Universelle*, to *Bibliothèque Nouvelle*. This great undertaking, continued in several successive volumes, though sufficient to occupy the life of an ordinary man, did not hinder M. Dupin from obliging the world with several other works. He was a man of prodigious reading; and had an easy happy way of writing, with an uncommon talent at analysing the works of an author; which makes his *Ecclesiastical Bibliothèque* so valuable. He was professor of philosophy in the royal college; but was banished some time from the chair to Chatelleraut, on account of the famous *Cas de Conscience*; but was restored, and died in 1719.

DUPE RATIO, among mathematicians, denotes the ratio of 2 to 1. Thus the ratio of 8 to 4 is dupe. Sub-dupe ratio, is just the reverse, or as 1 to 2. Such is 4 to 8, or 6 to 12.

DUPLICATE PROPORTION, or **RATIO**, is a ratio compounded of two ratios: thus, the duplicate ratio of a to b , is the ratio of aa to bb , or of the square of a to the square of b . Hence the duplicate ratio ought to be well distinguished from double. In a series of geometrical proportionals, the first term to the third is said to be in a duplicate ratio of the first to the second: thus in 2, 4, 8, 16, &c. the ratio of 2 to 8 is duplicate of that of 2 to 4, or as the square of 2 to the square of 4. Duplicate ratio is therefore the proportion of squares, as triplicate is of cubes, &c. and the ratio of 2 to 8 is said to be compounded of that of 2 to 4, and of 4 to 8.

DUPLICATE, among lawyers, denotes a copy of any deed, writing, or account. It is also used for the second letters patent, granted by the lord chancellor, in a case wherein he had before done the same.

DUPLICATION, in general, signifies the doubling of any thing, or multiplying of it by 2: also the folding of any thing back again on itself. The duplication of a cube is a problem famous in antiquity: it was proposed by the oracle at Delphos, as a means to stop the plague, to double Apollon's altar, which was cubical. The difficulty of the problem consists in this, to find the side of a cube that shall be double in solidity to a given cube; which is only to be solved by finding two mean proportionals between the side of the given cube and double that side. Thus, if the given side be represented by a , its double by b , and the side sought by y ; we shall have $aa:yy::y:b$; and making $z = \frac{yy}{a}$, it will be $a:z::y:b$. So that y , the side of the cube sought, is the second of two mean proportionals between a and b .

DUPLICATURE, among anatomists, a term used to denote the folds of any membrane, or vessel: thus we say, the duplicatures of the intestines, peritonæum, &c.

DUPONDIUS, in antiquity, a weight of two pounds, or a money of the value of two asses. See *As*. As the *as* at first weighed a just pondo or libra, the dupondius then weighed two; and hence the name.

DUQUELLA, a fertile province of Morocco in Africa; 75 miles long and 60 broad.

DURA MATER, one of the membranes which surround the brain. See *ANATOMY*.

DURAMPOUR, a town of Hindostan, in the country of Guzerat, 45 miles S. E. of Surat.

DURANGO, a town of N. America, in the province of New Biscay. Lon. 105. 0. W. Lat. 24. 50. N.

DURANTA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order, Personate. Calyx quinquefid, superior; berry tetraspermous; seeds bilocular. It has three species, shrubs, with quadrangular branches.

DURATION. See *METAPHYSICS*.

DURATION, as marked by certain periods and measures, is what we most properly call time. See *TIME*.

DURATION of ACTION, according to Aristotle, is confined to a natural day in tragedy; but the epopea, according to the same critic, has no fixed time.

DURAZZO, a sea-port town of European Turkey, in Albania,

anciently named Epidamnus and Dyrrachium. It is 88 miles S. S. E. of Ragusa. Lon. 19. 19. E. Lat. 41. 54. N.

DURBUY, a town of France, in the department of Ourte, and late duchy of Luxemburg, 20 miles S. of Liege. Lat. 50. 18. N.

DURBUY, a late county of Luxemburg, now annexed to France.

DURCKHEIM, town of Germany, in the circle of the Upper Rhine, now included in the department of Mont Tonnerre; 12 miles N. E. of Newstadt.

DURESS, in law, is where a man is kept in prison, or restrained of his liberty, contrary to the order of law; or threatened to be killed, maimed, or beaten; and if such person so in prison, or in fear of such threats, make any specialty or obligation by reason thereof, such deed is void in law; and in any action brought upon such specialty, the party may plead that it was made by duress, and so he may avoid the action. Cowel.

DURHAM, a county of England, commonly called the Bishopric of Durham. It is bounded on the N. by Northumberland, from which it is separated by the Tyne, on the N. E.; on the E. by the German ocean; on the S. and S. W. by Yorkshire and the Tees; and on the W. by Cumberland and Westmoreland. Before the arrival of the Romans it was included in the British principality, of the Brigantes, and after their arrival made part of the province of Maxima Caesariensis. During the Heptarchy, it made part of the kingdom of Northumberland. It is now included in the northern circuit, in the province of York; and is a diocese and principality under the government of its own bishop, being a county palatine, the second in rank, and the richest in England. It extends 47 miles in length from E. to W. and 37 from N. to S. It is 107 miles in circumference, and contains 410,000 square acres, or 758 square miles.

DURHAM, the capital of the above county, remarkable for the salubrity of its air, and the abundance and cheapness of its provisions. It was built about 70 years before the Norman conquest, on occasion of bringing hither the body of St. Cuthbert. It lies 14 miles S. of Newcastle. Lon. 1. 27. W. Lat. 54. 50. N.

DURHAM, a river of the United States, which falls into the Piscataqua.

DURHAM, a town and township of Connecticut in New-Haven county. It is 22 miles S. W. of Hartford.

DURHAM, a town of New Hampshire, in Stafford county. On the top of a hill in this town is a rock, computed to weigh 60 or 70 tons, so exactly poised on another rock, as to be easily moved by one's finger. Its situation appears to be natural. Lon. 70. 54. W. Lat. 43. 5. N.

DURIO, a genus of the class and order polyadelphia polyandria. The calyx is five-cleft; corolla five-petaled; style one; stamina in five bodies; pome five-celled. There is one species, a tree of the East Indies.

DURNESS, a town of Scotland 46 miles N. N. W. of Dornoch.

DUROCORNIVUM, an ancient town of Britain; now called Cirencester. Ptolemy called it Corinium.

DUROCORTORA, or **DUROCORTORUM**, an ancient town of the Rhemi, in Belgica; now called Rheims.

DUROIA, a genus of the monogynia order, and hexandria class of plants. Calyx above is cylindrical and loped; border six-parted; no filaments; pome hispid. It has one species, a tree of Surinam.

DUOTRIGES, an ancient British nation, seated in Dorsetshire. Their name is derived from the two British words *Dur* water, and *Trigo* to dwell; and they got it from the situation of their country, which lies along the sea coast. It is not certain whether the Duotriges formed an independent state under a prince of their own, or were united with their neighbours the Damnonii; as they were reduced by Vespasian under the dominion of the Romans, at the same time, and with the same ease, and never revolted.

DURSEY, an island about 2 miles long, and half a mile broad, situated near the S. W. coast of Ireland.

DURSLEY, a town of Gloucestershire, celebrated for its manufacture of broad cloth. It is 15 miles S. of Gloucester. Lon. 2. 23. W. Lat. 51. 40. N.

DURSTOLORG, the son of Hungus, and the 73d king of the Picts, according to Dr. Anderson. (*Royal Geneal.*) He was murdered by his brother Eogan, who thus paved the way for the union

union of the Scots and Picts under Kenneth II. about A. D. 844

DURSTUS, or **DURST**, the son of Erp, king of the Picts, began to reign A. D. 406 according to Dr. Anderson; and after fighting many battles, (the Dr. says no less than 100, and that he lived 100 years!) died A. D. 451. In his reign the gospel was first preached to the Picts by St. Ninian. *Royal Geneal.*

DUSDHRUK, a town of Arabia, in Yemen. Lon. 44. 20. E. Lat. 13. 50. N.

DUSKY BAY, a bay on the S. W. coast of the island Tavaipoenamunoo, the most western one of New Zealand. It is reckoned by Captain Cook to be the most proper place in New Zealand for the procuring of refreshments. Lon. 166. 18. E. Lat. 45. 40. S.

DUSSELDORF, or **DUSSELDORP**, a strong town of Germany, in Westphalia, 21 miles N. N. W. of Cologne. Lon. 6. 52. E. Lat. 51. 12. N.

DUTCH, the people of the late United Provinces, now called Batavia, and Holland.

DUTCHES COUNTY, a county of New York, on the E. side of Hudson River.

DUTCHY, [*duche*, Fr.] A territory which gives title to a duke, or has a duke for its sovereign.

DUTCHY COURT, a court wherein all matters appertaining to the dutchy of Lancaster are decided by the decree of the chancellor of that court. The origin of this court was in Henry the IV.'s time, who obtained the crown by deposition of Richard II. and having the dutchy of Lancaster, by descent, in right of his mother, became seised thereof as king, not as duke: So that all the liberties, franchises, and jurisdictions of the said county passed from the king, by his great seal, and not by livery or attornment, as the earldom of March, and other possessions, which descended to him by other ancestors than the king's, did. Henry IV. by authority of parliament, severed the possessions, liberties, &c. of the said dutchy from the crown: but Edward IV. restored them to their former nature. The officers belonging to this court are, a chancellor, attorney general, receiver general, clerk of the court, and messenger; besides assistants; as attorneys in the exchequer, and chancery, and four counsellors.

DUTY, in a moral sense. See **MORAL PHILOSOPHY**.

DUTY, in the military art, is the exercise of those functions that belong to a soldier: with this distinction, that mounting guard and the like, where there is no enemy directly to be engaged, is called duty; but marching to meet and fight an enemy is called going on service.

DUTY, in polity and commerce, signifies the impost laid on merchandizes, at importation or exportation, commonly called the duties of customs; also the taxes of excise, stamp duties, &c. See **CUSTOM**, **EXCISE**, &c. The principles on which all duties and customs should be laid on foreign merchandizes which are imported into these kingdoms, are such as tend to cement a mutual friendship and traffic between one nation and another; and therefore due care should be taken in the laying of them, that they may answer so good an end, and be reciprocal in both countries. They should be so laid as to make the exports of this nation at least equal to our imports from those nations with which we trade, so that a balance in money should not be issued out of Great Britain, to pay for the goods and merchandizes of other countries: to the end that no greater number of our landholders and manufacturers should be deprived of their revenues arising from the product of the lands, and the labour of the people, by foreign importations, than are maintained by exportations to such countries. These are the rational principles on which our treaties of commerce with other countries ought to be grounded.

DUUMVIRATE, the office or dignity of the duumviri. See the next article. The duumvirate lasted till A. U. C. 388, when it was changed into a decemvirate. See **DECEMVIRI**.

DUUMVIRI, in Roman antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same functions: such as,

1. **DUUMVIRI CAPIALES**, the judges in criminal causes. From their sentence it was lawful to appeal to the people, who alone had the power of condemning a citizen to death.

2. **DUUMVIRI MUNICIPALES**, two magistrates in some cities of the empire, answering to what the consuls were at Rome.

3. **DUUMVIRI NAVALES**, two commissaries of the fleet, first created at the request of M. Decius, tribune of the people, in the time of the war with the Samnites. Their duty consisted in giving orders for the fitting out of ships, giving commissions of marine officers, &c.

4. **DUUMVIRI SACRORUM**, two magistrates created by Tarquin II. for performing the sacrifices, and keeping the Sibyl's books.

DUX. See **DUKE**.

DUYIVELAND, **DUYVELAND**, or **DIVELAND**, an island of Batavia or Holland, in the department of the Meuse, in Zealand.

DWAL, in heraldry, the herb nightshade, used by such as blazon with flowers and herbs, instead of metals and colours, for sable or black.

DWARF, in general, an appellation given to things greatly inferior in size to that which is usual in their several kinds: thus there are dwarfs of the human species, dwarf-dogs, dwarf-trees, &c. The Romans were passionately fond of dwarfs, whom they called nani or nanæ, inasmuch that they often used artificial methods to prevent the growth of boys designed for dwarfs, by inclosing them in boxes, or by the use of tight bandages. Augustus's niece, Julia, was extremely fond of a dwarf called Sonopas, who was only two feet and a hand breadth high. We have many other accounts of human dwarfs, but most of them deformed in some way or other, besides the smallness of their size. Many relations also concerning dwarfs we must consider as fabulous, as well as those concerning giants. The following, however, which we have reason to believe authentic, is very remarkable. Jeffery Hudson, the famous English dwarf, was born at Oakham in Rutlandshire, in 1619; and about the age of seven or eight being then but eighteen inches high, was retained in the service of the duke of Buckingham who resided at Burleigh on the hill. Soon after the marriage of Charles I. the king and queen being entertained at Burleigh, little Jeffery was served up to table in a cold pye, and presented by the duchess to the queen, who kept him as her dwarf. From seven till thirty, he never grew taller; but after thirty he shot up to three feet nine inches, and there fixed. Jeffery became a considerable part of the entertainment of the court. Sir William Davenant wrote a poem called "Jeffreidos," on a battle between him and a turkey-cock; and in 1638, was published a very small book, called the "New Year's Gift," presented at court by the lady Parvula to the lord Minimus (commonly called Little Jeffery) her majesty's servant, written by Microphilus, with a little print of Jeffery prefixed. Before this period, Jeffery was employed on a negotiation of great importance: he was sent to France to fetch a midwife for the queen; and on his return with this gentlewoman, and her majesty's dancing master, and many rich presents to the queen from her mother Mary de Medicis, he was taken by the Dunkirkers. Jeffery, thus made of consequence, grew to think himself really so. He had borne with little temper the teasing of the courtiers and domestics, and had many squabbles with the king's gigantic porter. At last, being provoked by Mr. Crofts, a young gentleman of family, a challenge ensued: and Mr. Crofts coming to the rendezvous armed only with a quirt, the little creature was so enraged, that a real duel ensued; and the appointment being on horseback with pistols, to put them more on a level, Jeffery at the first fire, shot his antagonist dead. This happened in France, whither he had attended his mistress during the troubles. He was again taken prisoner by a Turkish rover, and sold into Barbary. He probably did not remain long in slavery: for at the beginning of the civil war, he was made a captain in the royal army; and in 1644 attended the queen to France, where he remained till the Restoration. At last, upon suspicion of his being privy to the Popish plot, he was taken up in 1682, and confined in the Gatehouse of Westminster, where he ended his life in the 63d year of his age.

DWARF-TREES, a kind of diminutive fruit-trees, frequently planted in the borders of gardens, and so denominated from their low stature. Dwarf-trees were formerly in great request, but have been much neglected since the introduction of espaliers. The method of propagating dwarf-pears, which have been found to succeed better than any other dwarfs, is as follows: They are to be grafted on a quince-stock, about six inches above the ground; and, as soon as the bud has sprouted so far as to have four eyes, it

is to be stopped, in order that lateral branches may shoot forth. Two years after budding, the trees will be ready to be transplanted to the spot where they are to remain. They should be set at the distance of 25 or 30 feet square, and the intermediate space may be sown or planted with culinary herbs, while the trees are young; but such herbs are not to be placed too near their roots, which would thus be obstructed in their growth. Stakes are next to be driven around the tree, to which the branches of it are to be nailed with list, while young; being trained in an horizontal direction, and no branches being afterwards permitted to intersect each other: in shortening the roots, the uppermost eye should always be left outwards. The summer and autumn pears thrive most luxuriantly, when planted in this manner, but the winter pears do not succeed. Apples are also sometimes cultivated as dwarfs; for which purpose they are generally grafted on paradise stocks. These do not spread their branches so widely as pears, and therefore require to be set only eight feet apart. Some gardeners also rear

dwarf-apricots and plums, which, however, being less hardy than either apples or pears, seldom thrive when set according to this method.

DWINA, a province of Russia, in the government of Archangel; bounded on the E. by the province of Condinski, on the S. by Usting, on the W. by Kargapol, and on the N. by the White Sea. Archangel is the capital.

DWINA, the name of two large rivers, one of which rises in Lithuania, and, dividing Livonia from Courland, falls into the Baltic Sea a little below Riga; the other gives name to the province of Dwina in Russia, discharging itself into the White Sea a little below Archangel.

DYE, in architecture, any square body, as the trunk or notched part of a pedestal: or it is the middle of a pedestal, or that part included between the base and the corniche; so called because it is often made in the form of a cube or dye.

DYEING.

DYEING is the art of developing and extracting the colouring particles of any substance whatever, and of uniting and fixing them afterwards upon cloths, stuffs, or any other matters, so as apparently to constitute but one body. The object of this art, therefore, consists in depriving one body of its colouring principle, in order to fix it upon another in a durable manner; and the series of manipulations which are necessary to produce this effect, constitutes the art itself. The word, however, in its most common acceptation, is generally restricted to the art of tinging silk, wool, cotton, and linen with different colours: and in this sense the art of dyeing is practised as a trade, by those who do not meddle with any of the other branches, as staining of leather, &c.

GENERAL HISTORY OF THE ART.

The origin of the art of dyeing, or of imparting to different materials employed for the fabrication of garments and furniture, those beautiful colours which are afforded by many articles of the vegetable, animal, and mineral kingdoms, appears to have been of high antiquity. As most of these materials are, of themselves, either of dark and disagreeable colours, or else devoid of all colour, it is probable that, even in the very earliest ages, the love of ornament, which is natural to mankind, would induce them to stain their vestments with various colouring ingredients, especially with vegetable juices. The ancients also obtained from the coccus, now known by the name of kermes, a colour which was almost as highly esteemed as the purple, and which was sometimes mixed with it. According to Pliny, the Egyptians had discovered a mode of dyeing, somewhat resembling that which we use for colouring printed linens; the stuffs, probably after having been impregnated with different mordants, were immersed in vats, where they received various colours. And Mr. Delaval is of opinion, that they were possessed not only of the art of dyeing, but even of that of printing on cloths. The Phœnicians seem to have a strong claim to the invention of this art, and they held a decided pre-eminence in it for many ages: their purple and scarlet cloths were sought after by every civilized nation; and the city of Tyre, enriched by its commerce, increased to an amazing extent. But her career was stopped by the vanity and folly of the eastern emperors; under whose dominion this opulent city had unfortunately fallen. Desirous of monopolizing the wearing of the beautiful cloths of Tyre, these misjudging tyrants issued most severe edicts, prohibiting any one from appearing in the Tyrian blue, purple, or scarlet, except themselves, and their great officers of state. To this injudicious restriction is to be attributed the destruction of the Tyrian dyes. For under the impolitic restraint imposed on the consumption of the Phœnician cloths, the manufacturers and dyers were no longer able to carry on their trade; it grew languid, sickened, and expired: and, with the trade, the art itself also perished. Among the Greeks the knowledge of dyeing must have

been very imperfect, and little assisted by science; for the art of dyeing linen appears not to have been known in Greece before Alexander's invasion of India, where, according to Pliny, they dyed the sails of his vessels of different colours. The Greeks seem to have borrowed this art from the Indians. This last country seems to have been the nursery of the arts and sciences, which were afterwards spread and perfected among other nations. Accidents, which had a tendency to improve the art, could not fail to be multiplied rapidly, in a country rich in natural productions, which requires little labour for the support of its inhabitants, and the population of which was favoured by the bounty of nature, and the simplicity of manners, till it was opposed by the tyranny of succeeding conquerors. But religious prejudices, and the unalterable division in casts, soon shackled industry; the arts became stationary; and it would seem, that the knowledge of dyeing cotton in that country (for silk was then unknown, or at least very scarce) was as far advanced in the time of Alexander, as it is at the present period. The very beautiful colours, which are observable in some Indian linens, would lead one to suppose, that the art of dyeing had there attained a high degree of perfection; but we find by the description which Beaulieu, at the request of Dufay gave of some operations performed under his own eye, that the Indian processes are so complicated, tedious and imperfect, that they would be impracticable in any other country, on account of the great difference in the price which is paid for labour. It is unquestionably true, that European industry has far surpassed them in correctness of design, variety of shade, and facility of execution; and if we are inferior to them with respect to the liveliness of some colours, it is only to be attributed to the superior quality of some of their dyes, or perhaps to the length and multiplicity of their operations and processes. Dufay, Hellot, Macquer, and Berthollet have rendered essential services to this art. Dufay appears to have been the first who obtained just notions of the colouring particles, and shewed how they are naturally disposed to adhere more or less firmly to the filaments which receive them; and has very justly remarked, that without this disposition, stuffs would never assume any colour but that of the bath, and would always divide the colouring particles equally with it: whereas the liquor of the bath sometimes becomes as limpid as water, giving off all the colouring particles to the stuff; which (says he) seems to indicate that the ingredients have less attraction for the water than for the particles of the wool. Berthollet's treatise on dyeing is one of the best epitomes on the subject; and chemistry, and the arts of dyeing, and of bleaching, have been much indebted to his labours. A translation of this work by Mr. Hamilton was published in 1793, 2 vols. 8vo. Also Chaptal, D'Apligny, D'Anbournay, and Hauffman, in France, have published treatises on the art of dyeing, which have much contributed to its improvement. In Sweden, Scheffer's work on the subject; is accompanied with notes by the celebrated Bergman. In Germany

many experiments in different processes of dyeing have been published by Beckmann, Poerner, Vogler, and Francheville. In England two very valuable essays on dyeing have been written by Delaval and Henry; to which may be added, the excellent treatise on the philosophy of permanent colours, by Dr. Bancroft.

THEORY OF DYEING.

Sir Torbern Bergman seems to have been the first, who referred the phenomena of dyeing entirely to chemical principles. Having dyed some wool and some silk in a solution of indigo, in very dilute sulphuric acid, he explains the effects he observed in the operation, by attributing them to the precipitation, occasioned by the blue particles having a stronger attraction for the particles of the wool and silk, than for those of the acidulated water; he remarks, that this attraction of the wool is so strong, as to deprive the liquor entirely of the colouring particles; but that the weaker attraction of the silk can only diminish the proportion of these particles in the bath: and he shews, that both the durability of the colour, and the degree of intensity it is capable of acquiring, depend on these different attractions. This is, in fact, the true light in which the phenomena of dyeing should be viewed; they are real chemical phenomena, which ought to be analysed in the same way as all those dependant on the actions which bodies exert, in consequence of their peculiar nature. It is evident, that the colouring particles of bodies possess chemical properties, that distinguish them from all other substances; and that they have attractions peculiar to themselves, by means of which they unite with acids, alkalies, metallic oxides, or calces, and some earths, principally alumine or pure clay. They frequently precipitate oxides and alumine, from the acids which held them in solution; at other times they unite with the salts and form supra compounds, or compounds of more than two ingredients, which combine with the wool, silk, cotton, or linen. And with these, their union is rendered much more close by means of alumine, or metallic oxide, than it would be without their intervention. The difference in the attractions of the colouring particles for wool, silk, and cotton, is sometimes so great, that they will not unite with one of these substances, while they combine very readily with another: thus, cotton receives no colour in a bath which dyes wool scarlet. Dufay got a piece of stuff made, the warp of which was wool and the weft cotton, which went through the process of fulling, that he might be certain, that the wool and the cotton received exactly the same preparation; but the wool took the scarlet dye, and the cotton remained white. It is this difference of attraction, which renders it necessary to vary the preparation and the process, according to the nature of the substance which is intended to be dyed of a particular colour. And these considerations ought to determine the means to be pursued for the improvement of the art of dyeing. It is highly proper to endeavour to ascertain, what are the constituent principles of the colouring particles. And in this inquiry, the most essential circumstances are, to determine the affinities of a colouring substance, first, with the substances which may be employed as menstrua; 2dly, with those which may by their combinations modify the colour, increase its brilliancy, and help to strengthen its union with the stuff to be dyed; 3dly, with the different agents which may change the colour, and principally with the external agents—air and light. The qualities of the uncombined colouring particles are modified when they unite with a substance; and if this compound unites with a stuff, it undergoes new modifications. Thus the properties of the colouring particles of cochineal are modified, by being combined with the oxide of tin, and those of the substance resulting from this combination, are again modified by their union with the wool or silk; so that the knowledge we may acquire, by the examination of colouring substances in their separate states, can only inform us respecting the preparations that may be made of them: that which we acquire respecting their combinations with substances which serve to fix them, or to increase their beauty, may inform us what processes in dyeing ought to be preferred or tried; but it is only by direct experiment made with the different substances employed in dyeing, that we can confirm our conjectures, and properly establish the process. These facts shew, that the changes produced by acids and alkalies on many vegetable colours, such as the chemists employ, in order to discover the nature of different substances, are owing to the combinations, which take place between these co-

louring particles, and the acids and alkalies. The compounds resulting from these may be compared to neutral salts, which possess qualities different from those of their component parts, but in which one of these parts may be in excess, and its qualities consequently predominant. This state of combination is observable between the colouring particles of cochineal and acidulous tartrate of potash, or cream of tartar; by evaporating slowly a solution of this salt in a decoction of cochineal, crystals are formed, which retain a fine ruby colour, much more bright and intense than that of the liquor which formed them. There are also some acids, particularly the nitric, which, after having combined with the colouring particles, change the colour which they at first produced, make it yellow, and destroy it. They then act by means of one of their principles, the oxygen, or vital air. Blue colours are not the only ones which become red by the addition of acids, and green by that of alkalies; most red colours, as that of the rose, for instance, are heightened by acids, and made green by alkalies; and some green colours, such as that of the green decoction of burdock, according to the experiments of Mr. Nose, and the green juice of buckthorn, as is evident from the trials of Mr. Becker, are reddened by acids. This property, which is common to most of the ordinary colours of vegetables, seems to prove, that there is a great analogy between their colouring particles; and it is not without foundation, that Linnaeus supposed, that the red in vegetables was owing to an acid, and indicated its presence; but there are also many vegetables which contain acid in a disengaged state, without their possessing a red colour. It is therefore evident, that the colouring particles have attractions for acids, alkalies, earths, and metallic oxides, which constitute a part of their chemical properties; and in consequence of which, their colours are more or less varied: therefore these particles form, with the stuff on which they are fixed, a compound which retains only some of their original properties: they are also modified by their union with alumine, or pure clay, metallic oxides, and some other substances; as are also those new compounds, when they are further combined with the stuff: all these modifications are analogous to what is observed in other chemical combinations.

OF MORDANTS.

Mordant is a term that appears to have been first introduced by the French dyers; and is applied to those substances that serve as intermedia between the colouring particles, and the stuff to be dyed, either for the purpose of facilitating, or of modifying their combination. Basis would seem to be a more appropriate term. Mordants deserve the greatest attention; as by their means colours are varied, brightened, made to strike, and rendered more durable. We shall therefore examine the nature of the action of the principal bases or mordants, and endeavour to determine how their attractions serve to unite the colouring particles with the stuff, and how they affect the qualities of the colours. A basis or mordant is not always a simple agent, for new combinations are sometimes formed by the ingredients that compose it; so that the substances employed are not the immediate agents, but the compounds which they have formed. Sometimes the mordant is fixed with the colouring particles, and sometimes the stuff is impregnated with it; on other occasions, both these modes are united; and we may dye successively with liquors containing different substances, the last of which only can act on the particles with which the stuff is impregnated. The principal substances employed as mordants are, aluminous salts, lime, metallic oxides, some astringent substances, and animal matters. The art of printing linen affords many processes, in which it is easy to observe the effects of mordants: therefore, to elucidate this subject, we shall mention a few examples. The basis employed for linens intended to receive different shades of red, is prepared by dissolving in 8lb. of hot water, 3lb. of alum, and 1lb. of acetite of lead, or sugar of lead, to which 2oz. of potash, and afterwards 2oz. of powdered chalk are added. The alum is decomposed by the acetite of lead, because the oxide or calx of lead combines with the sulphuric or vitriolic acid, and forms an insoluble salt which is precipitated; the base of the alum, alumine, at the same time combines with the acetic acid, or vinegar, and produces an acetite of alumine; and the chalk and potash answer the purpose of saturating the excess of acid. One of the advantages, which result from the formation of the acetite of alumine, is, that the alumine is retained in it by a much weaker attraction than in the alum;

alum; so that it more easily quits its menstruum, to combine with the stuff and colouring particles. Another advantage is, that the acid liquor, from which the alumine is separated, has much less action on the colour when it consists of the acetous, than when it consists of a stronger acid, such as the sulphuric. In short, the acetite of alumine not having the property of crystallizing, the mordant, which is thickened with starch or gum, to prepare it for being applied to the block on which the design is engraved, does not curdle, as it would if it contained alum capable of crystallizing. By attending to the operation performed upon a piece of linen cloth, we find, that when it has been impregnated by the mordant, in the manner determined by the design, it is put into a bath of madder; the whole of the cloth becomes coloured, but the tinge is deeper in those parts which have received the mordant; there the colouring particles have combined with the alumine and the cotton, so that a triple compound has been formed, and the acetous acid separated from its basis is carried off in the bath. Thus the colouring particles, combined with the alumine and the stuff, are much more difficultly affected by external agents, than when they are in a separate state, or combined only with the stuff, without any intermediate bond of union: and on this property the operations, to which the cloth is afterwards subjected, are founded: after it has been maddered, it is boiled with bran, and spread upon the grass; and these operations are alternately repeated until the ground becomes white. The colouring particles, which have not united with the alumine, are altered in their composition, dissolved, and separated, while those that have combined with it remain, and are preserved, without alteration; and thus, the design alone remains coloured. It seems that this destruction of the colouring particles, by exposure on the grass, and boiling with bran, is accomplished in the same manner as that of the colouring particles of flax, and admits of the same explanation. The only difference consists in substituting bran for alkalies, because they would dissolve a part of the colouring matter, which is fixed by the alumine, and would change its colour; instead of which, the bran, having a much weaker action on this substance, affects only the colouring particles, which, by the action of the air, have been disposed more easily to solution. If, however, instead of the mordant, a solution of iron be employed, the same phenomena takes place; the colouring particles decompose the solution of iron, and form a triple compound with the stuff; but, instead of red, we get from the madder brown colours of different shades, down even to black: and, by uniting these two mordants, alum and iron, we have mixed colours, inclining to red on the one hand, and to black on the other, such as mordoré and puce colour. Other colours are also procured by substituting dyers weed for madder; and by means of these two colouring substances, indigo, and the two mordants above mentioned, we obtain most of the different shades that are observable in stuffs which are printed. The substances which compose a mordant are sometimes incapable of decomposing each other solely by their own attractions; but the attraction of the stuff for one of their constituent parts brings about a decomposition and new combinations; and sometimes this effect is not produced or completed without the aid of the attraction of the colouring particles. This appears to be the case in the mixture of alum and tartar, one of the most common mordants employed in the dyeing of wool. The attraction of alumine for animal substances, is not merely indicated by uncertain appearances, nor supposed for the purpose of being employed in explanations, but is proved by direct experiment. M. Berthollet united them together, by mixing an animal substance with a solution of alum; a double exchange took place, the alkali entered into combination with the acid of the alum, and the alumine, combining with the animal substance, was precipitated. He also proved the attraction of alumine for animal substances by another experiment; having mixed a solution of glue with a solution of alum, he precipitated the alumine by an alkali, and the glue with which it had combined fell down along with it. This compound has the appearance of a semi-transparent jelly, and grows dry with difficulty. Thus, in the preceding experiments, the alkali precipitated the alumine combined with the animal substance, from the uncrystallizable residuë of the alum which had been boiled with the wool. The attraction of alumine for most colouring substances, may also be shewn by direct experiment. If a solution of a colouring substance be mixed with a solution of alum, a precipitation sometimes takes place; but if to the liquor

we add an alkali, which decomposes the alum, and separates the alumine, the colouring particles are then precipitated, combined with the alumine, and the liquor remains clear: this compound has got the name of lake. In this experiment, too much alkali must not be added, because alkalies are capable of dissolving lakes in general. No experiment has, however, yet shewn, that alumine attracts any vegetable substance except the colouring particles: its attraction for them seems much weaker than that which it has for animal substances; hence the acetite of alumine is a better basis for cotton and linen than alum is, and upon this depend the different means employed to increase the fixity of the colouring particles of madder in the dyeing of these substances. The oxides or calces of metals have so great an attraction for many colouring substances, that they quit the acids in which they were dissolved, and are precipitated in combination with them. On the other hand, all metallic oxides have the property of uniting with animal substances; and these different compounds may be formed by mixing an alkali saturated with an animal substance, with metallic solutions. It is not surprising, therefore, that metallic oxides should serve as a bond of union between the colouring particles and animal substances; but, besides the attraction of the oxides for the colouring particles, and for animal substances, their solutions in acids possess qualities which render them more or less fit to act as mordants: thus, those oxides which easily part with their acids, such as that of tin, are capable of combining with animal substances, without the aid of colouring particles; it is sufficient to impregnate the wool or the silk with a solution of tin, although they be afterwards carefully washed, which is not the case with other metallic solutions. Some metallic substances afford, in combination, only a white and colourless basis; and some by the admixture of their own colour, modify that which is proper to the colouring particles; but in many metallic oxides, the colour varies according to the proportion of oxygen they contain, and the proportion of this is easily liable to change. Upon these circumstances their properties in dyeing chiefly depend. The greater or less disposition of the stuff to unite with the colouring particles, must frequently occasion considerable differences in the mode of employing the mordant: thus, when this disposition is strong, the mordant may be mixed with the colouring substance; the compound then formed unites with the stuff immediately: but if it be weak, the compound formed by the colouring particles, and the substance employed as an intermedium, may separate, and be precipitated, before it can be attached to the stuff. To prevent this inconvenience, we must begin by attaching to the stuff the substance which is to serve as the medium of union, between it and the colouring particles. But to judge of the effects of mordants, and of the most advantageous manner of employing them, we must pay attention, first, to the combinations which may be produced, either by the action of the substances which compose them, or by that of the colouring particles and the stuff; 2dly, to the circumstances which may concur in bringing about these combinations more or less quickly, or in rendering them more or less complete; 3dly, to the action that the liquor in which the stuff is immersed may have, either on its colour or texture; and in order to foresee what that action may be, it is necessary to know the proportions of the principles, which enter into the composition of the mordant, and what will be left in an uncombined state in the fluids.

OF THE ACTION OF DIFFERENT SUBSTANCES ON COLOURS.

The colouring particles have been hitherto considered only as substances capable of forming different combinations, by which their properties are modified; but they may be altered in their composition, either by other external agents, or by the substance with which they unite. We shall begin with an examination of the changes produced by external agents, because they are more easily ascertained. The stability of a colour consists in its power of resisting the action of vegetable acids, alkalies, soap, and more especially that of the air or light; but this power varies exceedingly, according to the nature of the colour and the species of the stuff; for the same durability is not required in the colours of silk as in those of wool. There is not much obscurity in the action of water, acids, alkalies, or soap: it is a solution brought about by these agents; and it appears that a small quantity of acid, or of alkali, sometimes unites with the compound which gives the colour; because the colour is not destroyed, but only changed, and

may be restored by taking away this acid, *e. g.* by chalk and ammoniac, or volatile alkali. But this is not the case with respect to the action of air and light. The action of the air on colouring matter is derived principally from the oxygen contained in the atmosphere. M. Berthollet observes, that the air combining with them, renders them weaker and paler, and by degrees occasions a slight combustion, by means of which the hydrogen which entered into their composition is destroyed; they change to a yellow, red, or fawn colour; their attraction for the stuff seems to diminish; they separate from it, and are carried off by water: all these effects vary, and take place more or less readily, and more or less completely, according to the nature of the colouring particles; or rather, from the nature of the properties which they possess, in the state of combination into which they have gone. The alterations which occur in the colours, produced the union of the colouring particles with metallic oxides, are effects compounded of the change which takes place in the colouring particles, and of that which is undergone by the metallic oxide. The light of the sun considerably accelerates the distinction of colours. It ought, therefore, if this theory be well founded, to favour the combination of oxygen, and the combustion thereby induced. M. Sennebie, who has given many interesting observations on the effects of light on different substances, and particularly on their colours, attributes these effects to a direct combination of light with the substances. And the effects of light on the colour of wood have long ago been noticed; it preserves its natural appearance while kept in the dark, but when ever it is exposed to the light, it becomes yellow, brown, or of other shades. M. Sennebie has remarked the varieties which occur in this particular, in different kinds of wood, and has found that the changes are proportioned to the brightness of the light, and that they take place even under water, but that wetted wood underwent these changes less quickly than that which was dry; that several folds of ribband were required to defend the wood completely, that a single leaf of black paper was sufficient, but that when paper of any other colour was substituted, the change was not prevented; a single covering of white paper was insufficient, but two intercepted the action of the rays of light. M. Sennebie has also extended his experiments to a great number of vegetable substances, in a manner that may serve to illustrate different phenomena of vegetation. If a well made solution of the green parts of vegetables in alcohol, which has a fine green colour, be exposed to the light of the sun, it very soon acquires an olive hue, and loses its colour in a few minutes. If the light be weak, the effect is much more slow; and in perfect darkness, the colour remains without alteration, or if any change does take place, it requires a great length of time. An alkali restores the green colour; but if the change of colour in the liquor has been completed, the alkali has no effect. No change of colour takes place in azotic gas, nor in a bottle which is exactly full. A bottle half full of this green solution was inverted over mercury, by M. Berthollet, and exposed to the light of the sun; when the colour was discharged, the mercury was found to have risen in the bottle, and consequently oxygen had been absorbed, having united with the colouring matter. Light, therefore, acts by favouring the absorption of oxygen, and the combustion of the colouring matter; at first, the marks of combustion are not evident; the liquor retains only a slight yellow tinge; but by the assistance of heat, the combustion is completed, the liquor becomes brown, and leaves a black residuum. If the vessel which holds the liquor contain no oxygenous gas, the light has no effect on the colouring matter; azotic gas in this situation does not suffer any diminution. The observation, that ribbands, or a single leaf of white paper, do not prevent the action of light, deserves attention, as it shews that light can pass through coverings which appear to be opaque, and exert its force at some way within. Beccaria and Sennebie have compared the effects of light on ribbands of various colours; but the differences they have observed are rather to be attributed to the nature of the colouring matters than to the colours; for a ribband dyed with Brasil wood will lose its colour much sooner than one dyed with cochineal, though the shade should be exactly the same in each. On the whole, it is evident that colouring substances resist the action of the air more or less, according as they are more or less disposed to unite with oxygen, and thereby to suffer more or less quickly a smaller or greater degree of combustion. Light favours this effect, which in many cases is not produced without its assistance; but the colouring matter, in its sepa-

rate state, is much more prone to this combustion than when united to a substance, such as alumine, which may either defend it by its own power of resisting combustion, or by attracting it strongly, weaken its action on other substances, which is the chief effect of mordants. This last compound acquires still greater durability, when it is capable of combining intimately with the stuff upon which it is deposited. Thus the colouring matter of cochineal dissolves easily in water, and its colour is quickly changed by the air; but when united to the oxide of tin, it becomes much brighter, and almost insoluble in water, though it is still easily affected by the air, and by oxygenated muriatic acid; it resists the action of these better, however, when it has formed a triple compound with a woollen stuff. But still it must not be inferred, that all yellow colours are owing to the carbonic part of the colouring substance; very different compounds are capable of producing the same colour; thus, indigo is very different from the blue of our flowers, from that of oxide of copper, and from that of Prussian blue.

OF ASTRINGENTS.

Astringents deserve particular attention, not only from their great use in dyeing, but as possessing a property common to many vegetables. Our ideas respecting this property have been extremely vague; some slight resemblance in taste has frequently been the only circumstance attended to, and, under the name of astringents, alum, as well as many vegetables of very different properties, have been confounded together in the arts, as well as in medicine. Almost every substance, which renders a solution of iron black, has been considered as astringent. This effect has been supposed to be owing to one identical principle, existing in all the substances which produce it, and on which the title astringent has been bestowed. It is still considered as a particular acid; to which the name of gallic acid is given, from galls, in which it is found to be predominant. The gall-nut is an excrescence found on the young branches of the oak, and produced by the puncture of an insect. Different kinds of the gall-nut are met with, some inclining to white, yellow, green, brown, or red; others ash-coloured or blackish. They also differ greatly in magnitude, and are either round or irregular, heavy or light, smooth or covered with protuberances. Those which are small, blackish, knotted, and heavy, are the best; and are known by the name of Aleppo galls. These astringent substances are almost totally soluble in water by long ebullition. Sixteen drams afforded Neumann fourteen of extract; from the remaining two drams, only four grains could be abstracted by alcohol. And the same quantity treated first with alcohol, and then with water, afforded twelve drams and two scruples of spirituous extract, and four scruples of watery extract; the residuum weighed half a scruple more than the preceding experiment. In the spirituous extract the taste is more strong and disagreeable than in the watery extract. If the astringent property were owing to an individual principle, which was always the same, distributed in different vegetables, the precipitates obtained by their means, from a solution of iron, would constantly form the same compounds, and exhibit the same appearances and properties; but the precipitate produced by galls is of a blackish blue; that by logwood has a different shade of blue; that by oak is of a fawn colour, or blackish brown; that by quinquina a blackish green. They fall down with different attendant circumstances, and when fixed on stuffs, are discharged by alum and tartar, some much more easily than others; and probably, by multiplying experiments, many other remarkable differences may be discovered in the properties of these different precipitates. Astringents form with iron different species of compounds, and consequently do not derive their properties from one principle; but there must be a property common to different substances, to enable them to act in an uniform manner on solutions of iron, and to produce precipitates more or less black, and thus appearing of the same nature, and this common property is called the astringent principle. But, notwithstanding chemists have considered the astringent principle as always the same, experience has taught us, that all astringent substances were not equally proper for producing a beautiful and durable black: it is of importance to determine which of them may be employed with the greatest success: it is, however, very difficult to make comparative experiments on this subject with perfect accuracy, because some substances require much longer boiling than others to extract their astringency; because a difference

ence in their coarseness or fineness, when subjected to ebullition, is sufficient to produce differences in the results; and because the colouring particles have a greater or less disposition to combine with the stuff, according to the proportion of sulphate of iron that has been made use of. Solutions of iron in different acids may produce differences in the results, according to the state of oxygenation of the iron in them, according as the proportion of that metal is greater or less, and according to the strong or weak action, which the different acids, when disengaged, are capable of exerting on the newly formed compound. And, in the dyeing of a stuff, considerable alterations may arise from its greater or less attraction for the colouring particles. We shall now consider the astringent principle in regard to its property of combining with vegetable and animal substances, particularly the latter. Silk acquires by galling, which is an operation that consists in macerating a stuff in a decoction of some astringent substance, a weight which cannot be taken from it, or diminished beyond a certain degree by repeated washing; after which operation, the stuff, when put into a solution of iron, is dyed black, because the astringent principle, decomposing the sulphate of iron, forms a triple compound with the oxide of iron and the stuff which is dyed. A gall-stuffed is likewise capable of combining with other colouring particles, the colours of which acquire fixity, if they do not naturally possess it; so that the astringent communicates its durability to the triple compound, or perhaps the more complex one which is formed; but by this union the colour generally becomes of a deeper shade. The astringent principle, by combining with animal substances, renders them incapable of corruption, and tends to render their texture more compact; and in this the art of tanning consists. To account for the colours, which proceed from the union of the colouring particles with the basis which a mordant gives them, we must attend to the proportion in which the colouring particles unite to that basis; thus the solution of tin, which produces a very copious precipitate with a solution of colouring particles, and which thereby proves that the oxide of tin enters in a large proportion into the precipitate, has a much greater influence on the colour of the precipitate, by the whiteness of its basis, than the solution of zinc, or that of allum, which generally produce much less copious precipitates. The precipitates produced by these two last substances retain very nearly the natural tint which the colouring particles afforded. It is, therefore, necessary to distinguish, in the action of mordants, the combinations that may take place by their means, between the colouring particles, the stuff, and the intermedium; the proportions of the colouring substances and intermedium; the modification of colour, which may arise from the mixture of the colour of the colouring particles, and of that of the basis to which they are united; and the changes which the colouring particles may suffer, from the combustion that may be produced by the substance that is employed as an intermedium. It is evident also, that astringents do not derive their characteristic property from an acid, or from any other individual and uniform principle, but from the property which they possess, of uniting with the oxide of iron, of reducing it to the state of a black oxide, and of acquiring themselves a dark colour, by the combustion they thereby experience. Galls readily undergo a slight combustion, which gives them a deep brown colour; but this combustion, which requires but a small quantity of oxygen, soon ceases without their properties being in any degree injured. But galls owe their stability to the large proportion of charcoal they contain; and as they have the property of combining with some vegetable substances, with several colouring matters, and particularly with animal substances, they serve as intermedia for them, and impart to them that stability which they possess in so very high a degree. In the opinion of Dr. Bancroft, an able writer on dyeing, M. Berthollet, in ascribing the decays of vegetable and animal colouring matters in general, to effects or changes similar to those of combustion, has gone much further than is warrantable by facts. It cannot, he thinks, be his intention, that we should apply the term of combustion to alterations which result from a simple addition of oxygen, to colouring matters, without a destruction or separation of any of their component parts; though many of the decays and extinctions of these colours evidently arise only from such simple additions of oxygen. The nitric, sulphuric, and other acids, containing oxygen, have the power not only of weakening, but of extinguishing, for a time, the colours of many tinted matters; not by any effect which can

properly be denominated a combustion, but rather by a change in their several attractions for particular rays of light; but none of their parts being destroyed, or carried away, the addition of an alkali, or of calcareous carbonate, will generally undo such alteration, and restore the original colour, by decomposing and neutralizing the acid or oxygen, which had caused the alteration. Dr. Bancroft also observes, that until further discoveries shall have been made, we are only authorised to conclude, that the permanent colours of natural bodies do not depend upon their thicknesses, sizes, or the densities of their several parts or particles, but upon certain affinities or attractions (chemical or physical) by which they are disposed to absorb and conceal some of the rays of light, and to reflect or transmit other rays, giving the sensations or perceptions of their respective colours; that the contact of light greatly contributes towards producing these affinities or attractions; but it only does this (as far as we yet know) either by promoting a combination or a separation of the basis of vital air in the different coloured or colouring substances. But though most of the changes of colour, in permanently coloured bodies, evidently depend on changes in their respective portions of oxygen, he is far from thinking that this cause operates exclusively in all cases, or that chemical knowledge is yet far enough advanced, to justify even an attempt towards a complete hypothesis respecting these most abstruse and most interesting phenomena. It may not be improper here to add that the most permanent dyes we have, are cochineal and gum-lac, for fine red and scarlet colours; indigo and woad, for blue; and, when mixed with different proportions of cochineal, or gum-lac, for purple and violet colours. Dyers-weed, and some other vegetables, for yellow; and madder for coarse reds, purples, and blacks. The fading colours are far more numerous, and include Brazil-wood, log-wood, red-wood, fustic, turmeric root, anatto, archil, &c. For further information on the theory of dyeing we refer to the works of the authors above-mentioned, and particularly to Berthollet's treatise, as being the most complete one as yet offered to the public on this subject.

OF THE PRACTICE OF DYEING.

The whole of the operative part of dyeing depends on the application of certain colours, which the workmen call primitive, and which are five in number, namely, blue, red, yellow, fawn, or root-colour, and black. Each of these furnishes a variety of intermediate shades, both according to the nature of the ingredients, and the acid or alkaline substances with which they are mixed. Two only of these five colours, should be prepared with ingredients producing no colour of themselves: but which, by their peculiar acidity, and the fineness of the earth they contain, dispose the pores of the substance to receive the dye. The colours which more particularly require such auxiliary process, are red and yellow, together with those derived from them. Black is obtained by a particular preparation; but blue and fawn colour require none, at least for wool; it being only necessary to scour and soak this substance well; then to immerse it in the dyeing vat, stirring it well about, and permitting it to remain for a longer or shorter time, in proportion as the colour is intended to be more or less deep. The ingredients used in dyeing blue consist of pastel, woad, and indigo.

1. PASTEL, [*Isatis Tinctoria*,] is prepared by gathering it when ripe, suffering it to rot, and then working it up into balls for drying; which weigh in general from 150 to 200 pounds, and resemble a collection of small dry lumps of earth, intermixed with the fibres of plants. In order to extract the colour, it is necessary to provide large wooden vats, from 12 to 16 feet in diameter, and 6 or 7 feet high, or of a magnitude proportioned to the quantity intended to be used. The preparation of the blue-vat is the most difficult process in the art of dyeing; and the practical directions given by those who understand it, are either defective, or mis-stated. The copper-cauldron should be placed as near to the vat as possible, and filled with pond-water: to which, if it be not sufficiently putrid, may be added two or three pounds of hay, together with eight pounds of brown madder, or of the bark of the root. The fire should be lighted about three o'clock in the morning, and the mixture boil for an hour and a half, or two hours, when the liquor is, by means of a spout conveyed into the vat, in which a peck of wheaten bran is previously infused. The pastel-balls are next to be put in, separately, while the liquor is running into the vat, in order that they may be the more easily broken

and stirred with the rake, which is a semi-circular wooden instrument, having a long handle. The mixture is occasionally agitated, till the vat has received all the hot liquor; and, as soon as the vessel is nearly half full, it should be covered with a lid, somewhat larger than its own circumference. A cloth should be likewise thrown over it, in order to confine the heat; after which the whole should be suffered to subside for four hours; when it ought to be uncovered, in order to give it air, and to mix it thoroughly. No lime, as is generally though falsely directed by dyers, should be put into the vat, but a small air-hole left on the top: the stirring and agitation may once more be repeated, at the expiration of three or four hours. If the ingredients, after these operations, be not yet ready and come to, that is, if the blue does not rise to the surface, but continues to foam, it will then be necessary, after working the mixture well, to let it stand an hour and a half longer; care being taken during that time to observe it minutely, in case it should cast blue. The vat is then to be filled up with water, and a sufficient quantity of indigo, dissolved in a ley of pot-ash, pure water, bran and madder. The vat being again covered, at the end of three hours a pattern is to be immersed in the liquor for a similar space of time, when it is to be taken out, to inspect the state of the vat. This pattern, when first taken out, should be of a green colour, but instantly turn blue; if the green be bright and good, the vat is to be stirred again, and then covered up, with the addition of a few handfuls of bran. Three hours after, the same operation is to be repeated, with the addition of more bran, if necessary, when it is to be covered up for an hour and a half longer; and, as soon as it subsides, another specimen is to be immersed in it for an hour, when it must be examined, to ascertain the state of the pastel. If the former be of a good green, when taken out, and turn suddenly to a deep blue, on being exposed to the air, another pattern is to be put in, to discover the effect of the vat; which, if the colour be sufficiently high, is to be filled with hot water, or (which is preferable, if it can be procured) with the liquor of an old madder-vat, and then stirred again. Now the vat is to be once more covered for an hour; after which the stuffs to be dyed should be immersed.

Woad is the next article in the making of a blue colour: the mode of preparing it differs in no respect from the preceding one, just described, excepting that it is weaker, and yields less colour.

INDIGO is the last ingredient in dyeing blues. The vat is about 5 feet high, 2 feet in diameter, and some what narrower towards the bottom, being surrounded by a wall, and having a vacancy for the embers. A vat of this size requires from 2 to 5, or even 6 lbs. of indigo; and this operation is conducted as follows: 1. About 15 gallons of river water are put into a copper to boil for about half an hour, together with 2 lbs. of pot-ash, 2 oz. of madder, and a handful of bran. 2. Immerse 2 lbs. of indigo in a pail of cold water, in order to separate the solid from the volatile particles, which will immediately rise to the surface. The watery liquor is then poured off, and the indigo, settled at the bottom of the pail, should be triturated in an iron mortar, with the addition of a small quantity of hot water, that ought to be shaken from side to side; and the floating particles of indigo, which are those most finely pounded, must be poured into another vessel. In this manner, the indigo remaining in the mortar is continually reduced, fresh water being repeatedly added, till the whole is pulverized so finely as to rise to the surface. The liquor which had, during the above stated preparation, been boiling in the copper, is now poured into the vat, together with the indigo, when the whole is well stirred with a rake, the vat closely covered, and surrounded with embers. If this operation commence in the afternoon, the embers must be renewed in the evening, and also in the morning and evening of the following day, in the course of which it should be twice gently stirred. Similar measures ought to be pursued on the third day, in order to preserve an uniform heat, and intimately mix the ingredients. A brassy scum will then be perceived to rise to the surface, in several detached parts: by continuing the heat on the fourth day, the scum becomes more coherent; and the froth, occasioned by stirring the liquor, appears blue, while the latter is of a deep green. As soon as it assumes this appearance, the vat should be filled, for which purpose a fresh liquor must be prepared, by putting 5 gallons of water into a copper, together with a pound of pot-ash, and half an oz. of madder.

When these ingredients have boiled half an hour, the decoction is poured into the vat, the whole well stirred, and if it produce much froth, it will be in a proper state for working the next day. This may likewise be ascertained by the brassy or scaly crust, which floats on the surface of the liquor; and, farther, if on blowing, or stirring, the latter with the hand, it assume a deep green colour, while the surface appears of a brownish blue. After the vats have been thus prepared, the dyeing of woollen or silken stuffs is very easy; no other process being required, than immersing them in warm water, wringing, and then steeping them in the vat for a longer or shorter time, according to the deepness of the colour intended to be imparted. The stuffs should be occasionally opened, that is, taken out of the vat, wrung over it, and exposed to the air for a minute or two, till it become blue: for it must be observed, that, in all the solutions of indigo, or other dyeing materials above described, the blue colour is produced only by exposure to the air, and the stuff, on being first drawn out of the liquor, always appears green, and will retain that tinge, unless it be exposed to the air. In dyeing blue, therefore, it is necessary to let the colour thus change previously to a second immersion, that the shade may be the better distinguished, as dark blues require to be repeatedly dipped. The method of dyeing cotton or linen blue, varies so little from that already described, as to render any farther directions unnecessary. When silk is to be dyed blue, there is generally a greater portion of indigo added.

For the **TURKEY BLUE**, which is the deepest, a very strong archil bath is first given; and for the **ROYAL BLUE**, one of the same kind, but weaker. Other blues are dyed without any ground being previously given. There is however a blue made as deep as the royal blue, for the ground of which cochineal is used instead of archil, in order to render it more permanent, whence the title *bleu fin* has been given it. A blue of little durability may be given to silk by means of verdegris and logwood; but it might be made more lasting, by first giving it a lighter shade than is intended in a bath of this kind, afterwards dipping it in an archil bath, and in the vat after that.

When **RAW SILK** is to be dyed blue, that should be chosen which is naturally white. It should be thoroughly soaked in water, and afterwards put into the vat in separate hanks, in the same manner as the scoured silk. In general, raw silk takes the dye more readily, and, if possible, the scoured silk is put into the vat before it. If raw silk require archil, or the other ingredients abovementioned, it is to be treated in the same manner already described.

2. The next of the primitive colours to be considered is **RED**, of which there are many shades and varieties; but the principal are scarlet, crimson, and madder-red. The process to be adopted for obtaining these colours, essentially differs from that of blues; as the former require a peculiar preparation of the stuffs to be dyed, on the exactness of which, the goodness of the colour in a great measure depends. These preparatory ingredients consist of alum, tartar, aqua-fortis, or a solution of tin in this acid. Galls and alkaline salts are also sometimes added, though they do not materially contribute to the colour. There are three kinds of scarlet, namely, those dyed with kermes, with cochineal, and with gum-lac. The first of these, called Venetian scarlet, is the most permanent, but the least bright; it is also apt to be less spotted than the others; but on account of the difficulty of procuring the insects which afford the colour, it is very seldom, if ever, used in this country. The second kind of scarlet, namely, that dyed with cochineal, is less permanent than the Venetian scarlet, though the drug is procured at a more reasonable price. It is, however, very difficult to dye the true cochineal scarlet: the success of this operation equally depends upon the choice of the material, the water employed, and the method of preparing a solution of tin, which is the only ingredient by which that delicate colour can be produced. To eight ounces of spirit of nitre an equal quantity of river-water is to be added; in this mixture are to be gradually dissolved half an ounce of the purest and whitest sal-ammoniac, and two drams of purified salt-petre. An ounce of tin, reduced to grains, by being dropped into cold water while melting, is next to be added drop by drop to the liquor thus prepared; the first being perfectly dissolved before a second is introduced. The solution resembles that of gold, and, if fine tin be employed, will be perfectly transparent, without any dust or sediment. With this

this liquor are to be mixed such proportions of cochineal as may be thought proper, and the stuffs dyed in the colour will acquire a most beautiful scarlet. The scarlet produced by gum lac, though not so bright as cochineal, is more permanent; the best lac is that which is of a blackish brown colour on the outside, and white within. The process of preparing this colour is very difficult; but the best method, we believe, is that of previously mixing the gum with comfrey, or other mucilaginous roots. These should be dried, finely pulverized, afterwards boiled for fifteen minutes in the proportion of half a dram to a quart of water, then strained through a linen cloth while hot, poured upon levigated gum-lac, and passed through a hair sieve. The whole is then digested in a moderate heat for twelve hours; and the gum remaining at the bottom should be stirred seven or eight times. The liquor thus impregnated with a fine crimson colour, is afterwards poured into a vessel, sufficiently capacious to hold four times the quantity, and filled up with cold water. On adding a small proportion of a strong solution of alum, the coloured mucilage subsides; and, should any tinge remain in the liquor; it may be precipitated by gradual additions of alum, till it become perfectly colourless. As soon as the crimson mucilage has entirely subsided, the clear water must be carefully decanted, the remainder filtered, and the fluid parts suffered to evaporate. If the whole of the colour should not be extracted by the first operation, it ought to be repeated, till the residuum changes to a pale straw-colour. In order to dye scarlet with this extract of gum-lac, the requisite proportion of the latter dried and pulverized, is to be put into an earthen or block-tin vessel; a little hot water poured upon it; and, when it is well moistened, a proper quantity of the composition added; the whole being stirred with a glass pestle. By this means the powder, which before was of a dark, dusky, purple, acquires an exceedingly bright scarlet colour. A solution of the crystals of tartar is then to be poured into the liquor, and as soon as it begins to boil, the cloth is to be repeatedly immersed in it, according to the common method. The remainder of the operation is to be performed in the same manner as if cochineal had been employed.

CRIMSON is the colour produced by cochineal, with alum and tartar only, without any solution of tin. For this dye, two ounces and a half of alum, with an ounce and a half of white tartar, are to be taken, for every pound of wool; and being put into a cauldron with a proper quantity of water, the solution should boil before the stuff is dipped. The wool is then immersed into the boiling liquor, where it continues two hours; after which it is to be taken out, wrung gently, rinsed in water, and put into a bag. A fresh liquor is next prepared for the dye, in which an ounce of finely-powdered cochineal is used for every pound of wool: when this decoction boils, the stuff is immersed, and managed in the manner already directed for scarlet. For producing the finest crimson dye, however, the wool is again to be dipped in a weak lixivium, made of equal parts of sal-ammoniac and pearl ashes. The preparation of the ingredients for madder-red is always with alum and tartar, the proportions of which are by no means ascertained even by dyers. The more general practice is, to put 5 ounces of alum and one of red tartar to every pound of worsted, a twelfth part of acid water being likewise added, and the wool boiled for two hours in this solution, in which worsted is to be kept for a week; but cloth will be sufficiently saturated in four days. A fresh liquor is then prepared for dyeing this wool; and when the water is nearly boiling, half a pound of the finest madder is to be thrown in for every pound of wool; being carefully stirred and well-mixed in the copper, previously to immersing the stuff, which is to be kept in the liquor for an hour; during which the latter must not boil, lest it should tarnish the colour.

The third primitive colour is YELLOW, for obtaining which there are ten different ingredients; but four of these only yield a good and permanent dye, namely, dyers'-weed, or, as the dyers call it, weld, savory, dyers', green-weed, and fenu-greek. The first of these, namely, weld, in general affords the truest yellow, and is therefore preferred to all the others. Savory and dyers' green-weed, being naturally somewhat green, are more advantageously employed for dyeing that colour; and the last yields different shades of yellow. In order to dye worsted and stuffs yellow, they undergo the usual preparation with tartar and alum, of the latter 4 ounces are allowed to every pound of wool, or 25lbs. to every 100; of the former, one ounce is sufficient for yellow; after dis-

solving both, the wool is boiled in the same manner as in the preceding colour. A fresh liquor is next to be made for the welding or yellowing, in the proportion of 5 or 6lbs. of dyers'-weed to every pound of stuff. Some inclose the drug in a clean woollen bag, to prevent it from mixing with the cloth to be dyed; and, in order to keep the bag down in the copper, they lay a cross of heavy wood over it. Others boil the weld in the liquor, till the water has imbibed all its colour, and the drug sinks to the bottom, when the stuff is suspended in a net; others, again, take the weld out, as soon as it is boiled. According to the shade required, other vegetables are occasionally mixed with that drug. By varying the proportions of the salts employed, as well as the quantity of colouring ingredients, and the time of boiling, different shades may be produced.

The fourth primitive colour is that denominated by dyers, the FAWN, or root colour. It is a kind of brown, and the process for dyeing it is widely different from those just described; the wool merely requiring a simple immersion in water, as already directed for blue. The materials employed consist of the green shell of the walnut, the root of the walnut tree, the bark of alder, santal or saunders-wood, sumach, and soot. The green walnut-shells are collected, when the nuts are thoroughly ripe; they are put into tubs or casks, which are afterwards filled with water, and are thus preserved till the succeeding year. Santal, or saunders-wood, is much inferior to walnut-shells; because, if used in too large a quantity, it stiffens, and consequently injures the wool. It is in general mixed with galls, sumach, and alder-bark, without which its colour could not be extracted: and though it yields very little with alum and tartar, it is nevertheless used in large quantities, on account of the solidity of its colour, which is naturally a yellow-reddish brown. The best of the different ingredients employed in dyeing fawn-colours, is the bark or rind of the walnut-tree. Its shades are uncommonly fine; its colours solid; and it renders the wool dyed in it flexible and soft. A cauldron half full of water is placed over the fire; and as soon as it grows warm, bark is added in proportion to the quantity of stuffs intended to be dyed, and the lightness or depth of the shades required. It is then boiled for about a quarter of an hour, when the cloths, being previously moistened with warm water, are immersed, frequently turned, and well stirred, till they have sufficiently imbibed the colour. They are aired, dried, and dressed in the usual manner. Next to the rind or bark, the root of the walnut-tree is the best dye for a fawn-colour: it also affords a variety of shades, similar to those produced by the bark, for which it is frequently substituted. The root, however, requires a different process: a cauldron is filled about three parts full of river-water, into which the root is immersed, after being tied up in a bag. When the liquor is very hot, the wool or stuff is plunged into it, repeatedly turned, and occasionally aired. The lighter stuffs are next to be dipped, till the colour, is completely extracted. During this operation, proper care should be taken to prevent the liquor from boiling, as in such case the first immersed would imbibe the whole of the colour. The process of dyeing with the bark of alder, is nearly the same as that pursued with walnut-roots: the boiling of it is at first not very material, as this drug very freely communicates its colour. It is chiefly used for worsted, imparting shades darkened with copperas; and for wool that is not required to be very dark, as it equally withstands the effects of the sun and rain. Sumach possesses nearly the same properties as the bark or rind of the walnut-tree; its colour is not so deep, somewhat inclining to green, but is solid and permanent. Where dark colours are required, sumach is frequently substituted for nut-galls, in which case a greater proportion becomes necessary. These different substances, however, are not unfrequently mingled together, and, as they are of a similar nature, and differ only in degree, it is easy to obtain various shades. With respect to the method of compounding the different ingredients with pulverized saunders-wood; 4lbs. of the latter are to be put into a copper, with half a pound of powdered nut-galls, 12lbs. of alder-bark, and 10lbs. of sumach. The whole is to be boiled, when a small portion of water should be added, to check the boiling: after immersing the cloth, stirring, and turning it repeatedly, it is aired, and washed in river-water. The quantities of these ingredients may be increased, or diminished, according to the depth of the shade required. The last substance employed in dyeing the fawn-colour, is soot, which is not only less solid

solid than the others, but also hardens, and imparts a very disagreeable smell to the wool, or stuff, dyed in it: it is therefore seldom, if ever used, unless the other ingredients cannot easily be procured.

The fifth, and last, of the primitive colours, is **BLACK**, which includes a great variety of shades. In order to impart a good black to woollen stuffs, they should be first dyed of as deep a blue as possible, which is called the ground, and is to be performed in the manner already directed. As soon as the cloth is taken out of the vat, it ought to be well washed in river-water, and afterward scoured at the fulling-mill. Next, the dyeing process is performed as follows: for every cwt. of cloth, 10lbs. of logwood cut into chips, and an equal quantity of Aleppo gall-nuts pulverized and inclosed in a bag, are to be put into a cauldron of a moderate size, where the whole is boiled for twelve hours in a sufficient quantity of water. A third part of this liquor is then to be poured into another cauldron, with 2lbs. of verdigrease, when the cloth is to be immersed for two hours, being repeatedly turned and stirred, the liquor in the mean time boiling very slowly, or rather, gently simmering. At the expiration of that time, the stuff is to be taken out, and the second part (being another third) of the liquor added to the first third, together with 8lbs. of copperas. The fire beneath the cauldron is then to be diminished, and the copperas left for half an hour to dissolve; the liquor being gradually cooling: after which the cloth is to be immersed for another hour, repeatedly turned as before, then removed and cooled. The remainder of the liquor is next to be mixed with the first two-thirds; and the bag carefully expressed; when fifteen or twenty pounds of sumach are to be added, together with two pounds of copperas. The whole is then made to boil; and, a small quantity of water being added to cool, the stuff is again immersed for two hours; at the end of which time it is to be taken out, cooled, and steeped in the dye for an hour longer, being frequently turned. The cloth is then to be carried to the fulling-mill, and well scoured, till the water runs from it perfectly colourless. As soon as this operation is performed, a fresh liquor should be prepared with the necessary quantity of dyers'-weed, which is only once to be boiled, and when cool, the cloth dipped into it. This last decoction softens the texture, and renders the colour a most beautiful black. Few dyers, however, take so much pains; for they are satisfied with dipping the cloth, when blue, in a decoction of nut-galls and boiling the whole for two hours. The stuff is then washed, and after adding some copperas and logwood to the liquor, the cloth is again immersed for two hours, at the end of which it is washed, scoured, dried, and pressed.

For dyeing silk black, different operations are necessary; as boiling the silk, galling it, the preparation of the bath, the operation of dyeing, and softening the black. The gummy substance, which silk in its natural state contains, does not increase the strength of the silk, which is then called raw: but renders it more liable to wear out, from the stiffness it imparts to it: and though raw silk takes a black colour with more facility, than silk which has been scoured or divested of its gum, that black is much less perfect, and resists the reactives calculated to dissolve the colouring matter, in a much less forcible manner. To cleanse silk intended to be dyed black, it is commonly boiled four or five hours with a fifth of its weight of white soap, after which it is beetled and washed carefully. For galling the silk, nearly three-fourths of its weight of galls are boiled for three or four hours: but Aleppo galls being dear, a greater or less portion of white galls, or even of an inferior kind, called berry or apple galls, is mixed with them. The proportion commonly used in France is two parts of Aleppo galls to eight or ten of berry-galls. After the boiling, the liquor is left at rest about two hours, that the galls may subside: the silk is put into the bath, and left there from 12 to 36 hours: it is then taken out and washed in a running stream. As silk is capable of combining with more or less of the astringent principle, its weight receives a considerable augmentation, not from the weight of the astringent principle alone, but also from that of the colouring matter, which fixes in it, in proportion to the quantity of the astringent principle combined with it. The processes for dyeing it are therefore varied, according as the operator is desirous of rendering the silk of a greater or less weight. And this difference constitutes the distinction between a light and heavy black. A pound of silk loses nearly one-fourth of its weight in the boiling

when complete; and recovers in the light black, and the galling which precedes it, $1\frac{1}{2}$ or 2 ounces; so that the original pound is reduced to about 14 ounces, but in the heavy black this same pound is increased in weight to 20 or 22 ounces, or even more; so that the buyer, deceived by the low price at which it is offered him, pays in every pound for several ounces of a substance which is not merely useless, but is even injurious to the beauty of the colour, and the strength of the stuff. The black which is much overcharged is never of a fine colour; it is therefore generally employed for the woof, and covered with a warp of a fine black. The difference in the process for obtaining heavy black consists in leaving the silk a longer time in the gall liquor, in repeating the galling and dipping of the silk in the dye oftener; leaving it in this also a considerable while. The first galling is also commonly performed with galls which had been already used, fresh ones being taken from the second. But this method is sufficient to give so great a surcharge as is necessary in some blacks. For this purpose the silk is galled raw, and afterwards rendered supple by wringing with the pin. A vat is preserved by the silk-dyers for the black; and its composition, greatly overcharged, varies in different dye-houses. These vats have commonly been set for many years, and when the black dye is exhausted, it is renewed by what is called a brevet. When the grounds which accumulate in them become too considerable in quantity, they are taken out; so that after a time nothing remains of several of the ingredients which composed the original bath, but those which are not used in the brevet.

To dye **RAW SILK**, it must be galled cold, in the gall bath which has already been used for scouring silk; and for this purpose, silk with the natural yellow hue is preferred. If it be wished to preserve a part of the gum of the silk, and afterwards soften it, the galling should be performed in a warm bath, as usual: but when it is intended to preserve the whole of the gum, and the elasticity which it communicates to the silk, the galling is performed cold. If the gall liquor be weak, the silk must remain in it several days. Silk, thus prepared and washed, readily takes the black dye; and the rinsings, to which sulphate of iron may be added, are sufficient to communicate it. This dyeing is performed cold; but it requires more or less time according to the strength of the rinsings. Sometimes three or four days are necessary; after which it is washed, giving it one or two beetlings, and that it may not be softened, it is dried without being wrung. But raw silk may be dyed more speedily, by turning or shaking it over in the cold bath after galling, and airing it, repeating these operations a few times; after which it must be washed and dried. Dr. Lewis remarks, that though white silk may be dyed a good black, without using either logwood or verdigris, the addition of those two ingredients contributes greatly to improve the colour both in silk and in wool. But as the great use of galls in dyeing silk black renders it very expensive, it is of consequence to find some method of diminishing their quantity. M. Angles proposes the following process: When the silk has been carefully boiled and washed in the river, it is to be immersed in a strong decoction of green walnut peels, and left in it till the colour of the bath is exhausted. It is then taken out, slightly wrung with the pin, dried, and washed in the river. The decoction of walnut-peels is made by boiling a full quarter of an hour, when it is taken from the fire, and suffered to subside before dipping the silk, which has been previously immersed in warm-water. A blue ground is next given by means of logwood and verdigris. For every pound of silk, an ounce of verdigris is dissolved in cold water; the silk is left in this solution two hours; it is there dipped in a strong decoction of logwood, wrung out slightly, and dried before it is washed at the river. For light blacks, galling may be altogether omitted; but to a heavy black, half a pound of galls must be employed for every pound of silk intended to be dyed. To prepare the bath, 2 lb. of galls and 3 of sumach are macerated in 25 gallons of water over a slow fire, for 12 hours. After straining, 3 lb. of sulphate of iron, and as much gum Arabic are dissolved in it. In this solution the silk is dipped at two different times, leaving it, in two hours each time, taking care to air it after the first dipping, and to dry it before giving the second fire, when it is to be again aired and dried: it is then beetled twice at the river; after which a third fire is given it, in the same manner as before, except that it is left in the bath four or five hours. When drained and dried, it is again beetled

beetled twice at the river. The heat during the operation must not exceed 122 degrees of Fahrenheit's thermometer; and before the last two fires, an addition of half a pound of sulphate of iron and as much gum Arabic is to be made. For removing the harshness that silk acquires from the black dye, M. Angles thinks that the decoction of weld should be preferred to that of a solution of soap; and says, that if silk be dyed blue with indigo previous to its being dipped for black, it will take only a mealy black, but that a velvety black will be obtained, if it be prepared with logwood and verdegis; and that green walnut-peels soften the silk. Though a fine black may be procured from green walnut-peels, and the bath above described, he notwithstanding adds logwood and verdegis, that he may not be obliged to use a large quantity of sulphate of iron, which weakens the silk too much. He thinks that galls only serve to give the silk weight, and that sumach is adequate to the dye. Linen and cotton do not easily take a black of any intensity that will resist soap; therefore to dye them black, a solution of iron is used, which is kept in a cask called the black cask. This solution is prepared with vinegar, small beer, or small wine made from the grapes, after they have been pressed, by adding water to them, which is soured with rye meal, to procure an acid liquid at a low price. Pieces of old iron are thrown into this liquor, which is never used in less than six weeks or two months. To this bath astringents are frequently added, particularly the decoction of alder bark, which of itself has the property of dissolving the oxide of iron in a pretty large proportion.

OF DYEING COMPOUND COLOURS.

Compound colours are produced by mixing together two simple ones; or, which is the same thing, by dyeing cloth first one simple colour, and then another. These colours vary to infinity, according to the proportions of the ingredients employed. They may be arranged under the following classes: Mixtures of, 1. Blue and yellow; 2. Blue and red; 3. Yellow and red; 4. Black and other colours.

Mixture of Blue and Yellow.—This forms green; which is distinguished by dyers into a variety of shades, according to the depth of the shade, or the prevalence of either of the component

parts. Thus we have sea-green, grass-green, pea-green, &c. Wool, silk, and linen, are usually dyed green by giving them first a blue colour, and afterwards dyeing them yellow; because, when the yellow is first given, several inconveniences follow: the yellow partly separates again in the blue vat, and communicates a green colour to it, and thus renders it useless for every other purpose, except dyeing green. And of the usual processes for dyeing blue and yellow may be followed, taking care to proportion the depth of the shades to that of the green required. When sulphate of indigo is employed, it is usual to mix all the ingredients together, and to dye the cloth at once; this produces what is known by the name of Saxon or English green.

Mixtures of Blue and Red.—These form different shades of violet, purple, and lilac. Wool is generally first dyed blue, and afterwards scarlet, in the usual manner. By means of cochineal mixed with sulphate of indigo, the process may be performed at once. Silk is first dyed crimson, by means of cochineal, and then dipped into the indigo vat. Cotton and linen are first dyed blue, then galled, and soaked in a decoction of logwood; but a more permanent colour is given by means of oxide of iron.

Mixtures of Yellow and Red.—These produce orange. When blue is combined with red and yellow on cloth, the resulting colour is olive. Wool may be dyed orange, by first dyeing it scarlet, and then yellow. When it is dyed first with madder, the result is cinnamon-colour. Silk is dyed orange by means of carthamus; a cinnamon-colour by logwood, Brazil-wood, and fustic, mixed together. Cotton and linen receive a cinnamon-colour by means of weld and madder; and an olive-colour, by being passed through a blue, yellow, and then a madder-bath.

Mixtures of Black with other Colours.—These constitute greys, drabs, and browns. If cloth is previously combined with brown oxide of iron, and afterwards dyed yellow with quercitron bark, the result will be a drab of different shades, according to the proportion of mordant employed. When the proportion is small, the colour inclines to olive or yellow; on the contrary, the drab may be deepened or saddened, as the dyers term it, by mixing a little sumach with the bark. See CALICO-PRINTING.

DYERS. By stat. 3 and 4 Ed. VI. c. 2, no dyer may dye any cloth with orchil, or with brazil, to make a false colour in cloth, wool, &c. on penalty of 20s. By stat. 23 Eliz. c. 9, dyers are to fix a seal of lead to cloths, with the letter M, to shew that they are well maddered, &c. or forfeit 3s. 4d. per yard. By stat. 23 Geo. III. c. 15, several penalties are inflicted on dyers who dye any cloths deceitfully, and not woaded throughout with indigo and madder. Dyeing blue with logwood, to forfeit 20l. Dyers in London are subject to the inspection of the dyers' company, who appoint searchers. In other places, these are appointed by the justices, and opposing the searchers incur a penalty of 10l.

DYER'S WEED, or WELD. See RESEDA.

DYEING, or STAINING OF PAPER, WOOD, IVORY, MARBLE, &c. See IVORY, MARBLE, PAPER, WOOD, &c.

DYEING OF HATS. See HATS.

DYEING OF LEATHER. See LEATHER.

DYKE-REEVE, in old statutes, an officer who had the care of the dikes, in the fens.

DYLE, one of the departments of France, formed out of the late Austrian Netherlands, and comprehending a great part of the province of Brabant. The chief city is Brussels.

DYLE, a river in the late Austrian Netherlands, which gives name to the department. It rises about 22 miles S. E. of Brussels, and falls into the Scheldt, at Ruplemond.

DYMEL, a river of Germany, in Westphalia.

DYMUDE. See DIXMUDE.

DYNA, an Indian coin, worth about 30s.

DYNAMICS [from *δυναμις*, Gr. power,] the science of moving powers, particularly of bodies which act mutually on each other. See MECHANICS.

DYNASTY, [from *δυναστευω*, Gr. a sovereign,] among ancient

historians, signifies a race or succession of kings of the same family. Such were the dynasties of Egypt. The Egyptians reckon 30 dynasties within the space of 36,525 years; but the most of chronologers look upon them as fabulous. And it is certain, that these dynasties were not continually successive, but many of them collateral and cotemporary.

DYRRACHIUM, in ancient geography, a town on the coast of Illyricum, before called Epidamnus, or Epidamnus, an inauspicious name, changed by the Romans to Dyrrachium; a name taken from the peninsula on which it stood.

DYSACOYA, [from *δυσ*, difficulty, and *ακουω*, to hear,] dullness of hearing.

DYSÆ, in the Saxon mythology, inferior goddesses, messengers of Woden, whose province it was to convey the souls of such as died in battle to his abode, called Valhall, i. e. the hall of slaughter; where they were to drink with him and their other gods, cerevisia, a kind of malt liquor, in the skulls of their enemies. The Dysæ conveyed those who died a natural death to Hela, the goddess of hell, where they were tormented with hunger, thirst, and every kind of evil.

DYSESTHESIA, [from *δυσ*, difficult, and *αίσθησις*, sensation,] a difficulty or defect in sensation. See MEDICINE.

DYSART, a borough in Scotland, on the N. shore of the Frith of Forth, 11 miles N. of Edinburgh. Lon. 3. 6. W. Lat. 56. 9. N.

DYSCINESIA, [from *δυσ*, and *κίνησις*, motion,] a difficulty of moving. See MEDICINE.

DYSCRASY, [*δυσκρασία*,] an unequal mixture of elements in the blood or nervous juice; a distemperature, when some humour or quality abounds in the body.

DYSECCEA. See MEDICINE.

DYSENTERIC FEVER. See MEDICINE.

DYSENTERY,

DYSENTERY, [from *δυσεντερία*,] a looseness, wherein very ill humours flow off by stool, and are also sometimes attended with blood. See **MEDICINE**.

DYSEPULOTICA, [from *δυσ*, *επι*, and *υλη*, a scar,] large incurable ulcers.

DYSNOMY, [from *δυσ* and *νομος*, law,] the enacting of bad laws.

DYSOPIA, [from *δυσ* and *ωφ*, an eye,] depraved vision. See **MEDICINE**.

DYSOREXIA, or **DYSOREXY**, [from *δυσ* and *ορεξις*, appetite,] a want of appetite. See **MEDICINE**.

DYSPEPSY, [*δυσπεψία*,] a difficulty of digestion, or bad fermentation in the stomach or guts. See **MEDICINE**.

DYSPHONY, [*δυσφωνία*,] a difficulty in speaking, occasioned by an ill disposition of the organs.

DYSPNOEA, [*δυσπνοία*,] a difficulty of breathing; straitness of breath. See **MEDICINE**.

DYSTHANATOS, [from *δυσ* and *θανάτος*, death,] among ancient physicians, is used to signify either a disease that occasions a slow painful death, or a person dying in such a lingering manner.

DYSTHERAPEUTA, [from *δυσ* and *θεραπεύω*, to heal,] diseases difficult to be cured.

DYSTOCHIA, [from *δυσ* and *τινω*, to bring forth,] difficult labour.

DYSURY, [*δυσουρία*,] a difficulty in making urine. See **MEDICINE**.

DYTISCUS, the **WATER BEETLE**, in zoology, a genus of the class and order insectæ coleoptera. Antennæ slender, setaceous; hind feet hairy, and formed for swimming. Nearly 200 species,

distinguished by their antennæ, the colour of the elytra, &c. The larvæ of the dytiscus are often met with in water. They are oblong, and have six scaly feet. Their body consists of eleven segments. The head is large with four filiform antennæ and a strong pair of jaws. The last segments of their body have rows of hairs on the sides; and the abdomen is terminated by two spines charged with the like hairs, forming a kind of plumes. These larvæ are frequently of a greenish variegated brown: they are lively, active, and extremely voracious; they devour and feed upon other water insects, and often tear and destroy each other. The perfect insect is little inferior to its larvæ in voraciousness, but it can only exercise its cruelty on the young larvæ; the perfect larvæ, like himself, being sheltered by a kind of scaly cuirass with which they are armed. This creature must be touched cautiously; for besides its power of giving a severe gripe with its jaws it has under the thorax, a long sharp spine, which it will drive into one's fingers by the effort it makes to move backwards. See Plate XXXVII.

DYVOUR, or **BARE-MAN**, in Scots law, a person who, being involved in debt, and unable to pay, to avoid imprisonment, makes cession of his effects in favour of his creditors; and does his devoir and duty to them, proclaiming himself bare-man and indigent, and becoming debt-bound to them of all he has. The word is used in the same sense as Bankrupt: see that article; and **LAW**.

DZURA, a Tartarian village of Russian Siberia, in the government of Irkutsch.

DZWINGROD, a town of Poland, in the palatinate of Kamieniec, 20 miles S. W. of Kaminiec.

E.

E Has two sounds; long, as scène, and short as men. It also has the peculiar quality of lengthening the foregoing vowel, as, gâp, gâpe; tûn, tûne. Yet it sometimes occurs final, where the foregoing vowel is not lengthened; as gone, knowledge, give. Anciently almost every word ended with *e*, as for can, canne; for year, yeare; for great, greate, &c. It is probable, that this *e* final had at first a soft sound, like the female *e* of the French; and that afterward, it was in poetry either mute or vocal, as the verse required, till at last it became universally silent.—*Ea* has the sound of *e* long: the *e* is commonly lengthened, rather by the immediate addition of *a* than by the apposition of *e* to the end of the word; as mēn, mēan; nēt, nēat. **E** is the fifth letter of the Alphabet, in the modern languages, and in many of the ancient. Its form is derived from the old character *𐤅* in the ancient Hebrew and Phœnician alphabets, inverted by the Greeks to this position **E**, and not from the Hebrew He, ה. From the same origin is also derived the Saxon *e*, which is the first letter in that alphabet that differs from the Latin one. It is sounded by a narrower opening of the larynx than the letter **A**; but the other parts of the mouth are nearly in the same position as when sounding that letter. The sound of *e* is obscure in the last syllable of participles ending with en, as bounden, chosen, frozen, &c. as well as in some nouns; such as haven, oxen, &c. and it is silent, or not sounded in a great number of words. The Greek language has a short **E** called *Epсилon*, and a long one called *Eta*; which differ, in form, as well as in sound, thus *E*, ε, and *H*, η. The Latin has a long and short *e*, but the Romans made no distinction of figure or name, but considered both sounds as one letter. In the French language, *e* has at least five different sounds besides being often silent. **E** in the calendar is the fifth dominical letter; and in music denotes the tone *E la mi*. As an Abbreviation, **E** is used in sea charts to distinguish all the easterly points; thus, **E** denotes East; **E**. by S.

East by South; **E**. by N. East by North; &c. **E**. is also used for Earl; as well as for *est*; thus *i. e. id est*, "that is." As a Numeral, **E** was used in the barbarous ages for 250. As a word, **E** was used in several ancient languages, with various significations. Thus in the Greek both **E** and **H** are words, and in Latin **E** is used both as a verb and preposition; but in English it does not constitute a word by itself.

EA, in the Saxon language, like **EAU** in the French, and **AA** in the Danish, signifies water, whence it makes part of the names of some rivers, lakes, &c.

EACHARD, **LAURENCE**, an eminent English historian of the 18th century. He was the son of a clergyman, and was educated at Cambridge, and presented to the living of Welton and Elskington in Lincolnshire, where he spent above twenty years, and distinguished himself by his writings, especially his *History of England*, which was attacked by Dr. Calamy and by Mr. Oldmixon. His "*General Ecclesiastical History, from the Nativity of Christ to the first establishment of Christianity by Human Laws, under the emperor Constantine the Great*," had passed through several editions. He was installed archdeacon of Stowe and prebend of Lincoln in 1712. He died in 1730.

EAD, [*ad ed*,] in the compound, and **eadig** in the simple names, denotes happiness, or blessedness.—Thus *Eadward* is a happy preserver; *Eadulph*, happy assistance; *Eadgar*, happy power; and *Ead* may also in some cases be derived from the Saxon *eath*, which signifies easy, gentle, mild.

EADISH, or **EDDISH**, [*Sax. Edisc*,] the latter grass, that grows after the corn is cut.

EAGLE, [*aigle*, French; *aquila*, Lat. *caller*, Erse,] in ornithology. See **FALCO**.

EAGLE, in antiquity, was born by way of ensign by several nations. The first who seem to have assumed the eagle are the Persians.

Persians; according to Xenophon. It was afterwards assumed by the Romans; who after a great variety of standards, at last fixed on the eagle, in the second year of the consulate of C. Marius. Till that time, they had used indifferently wolves, leopards, and eagles, according to the humour of the commander. The Roman eagles, were not painted on a cloth or flag; but were figures in relieve, of silver or gold, born on the tops of pikes; the wings being displayed, and frequently a thunderbolt in their talons. Under the eagle on the pike, were piled bucklers, and sometimes crowns. This we learn from the medals. Constantine is said to have first introduced the eagle with two heads, to intimate, that though the empire seemed divided, it was yet only one body.

EAGLE, in architecture, is a figure of that bird anciently used as an attribute, or cognizance of Jupiter, in the capital and friezes of the columns of temples consecrated to that god.

EAGLE, in astronomy, a constellation of the northern hemisphere, having its right wing contiguous to the equinoctial. See **AQUILA**, and **ASTRONOMY**.

EAGLE, in heraldry, is accounted one of the most noble bearings in armoury; and ought to be given to none but such as greatly excel in generosity and courage, or who have done singular services to their sovereigns; in which cases they may be allowed a whole eagle; or an eagle naissant, or only the head or other parts thereof, in proportion to their exploits.

EAGLE, **BLACK**, an order of knighthood, instituted in 1701, by the elector of Brandenburg, on his being crowned king of Prussia. The knights wear an orange-coloured ribbon, to which is suspended a black eagle.

EAGLE, **WHITE**, a Polish order of knighthood, instituted in 1325 by Uladislaus V. on marrying his son Casimir with a daughter of the great duke of Lithuania. The knights were distinguished by a gold chain, which they wore on the stomach, whereon hung a silver eagle crowned.

EAGLESTONE. See **ÆTITÆ**.

EAGLETS, in heraldry, several eagles on the same escutcheon.

EAHEINOMAUWE, an island in the S. Pacific Ocean, the most northern, as well as the most fertile of the two large islands, of which New Zealand consists. It was believed by the gentlemen who accompanied captain Cook, in his first voyage, that all kinds of European grain, as well as garden plants and fruit, would flourish here in the greatest abundance and perfection; and from the vegetables found it was concluded, that the winters are not more severe than those of England; and it was known by experience, that the summer was not hotter, though the heat was more equal. Here are no quadrupeds except dogs and rats; and the latter are so scarce, that they escaped the notice of many on board. The birds are not numerous. The gannet is the only one of the European kind that was observed. The insects are equally scarce; but the sea makes abundant recompence for this scarcity of land animals; every creek swarms with fish, equally delicious with those in this country. The forests are of vast extent; and filled with excellent timber trees, the largest, straightest, and cleanest; that captain Cook had ever seen.

EALDERMAN, or **EALDORMAN**, among the Saxons, was of the same import with earl among the Danes. It was also used for an elder, senator, or statesman; whence the title Alderman.

EAOOA, **EAOOWE**, or **MIDDLEBURG**, one of the Friendly islands in the South Pacific ocean, which abounds with groves of fruit and other trees, interspersed with tracts covered with grass. It was first discovered by Tasman who called it Middleburg. Lon. 174. 30. W. Lat. 21. 24. S.

EAR. See **ANATOMY**, and **ZOOTOMY**.

EAR, in botany, the same with spica. The flowers and seeds of wheat, rye, barley, lavender, &c. grow in ears. The stem of the ear means its tube or straw; the knot of the ear, the lobes or cells wherein the grains are inclosed, &c.

EAR, in music, the power of judging of harmony. See **MUSIC**. In music we seem universally to acknowledge a kind of internal sense, distinct from the external one of hearing; which we call a good ear. And the like distinction we should probably acknowledge in regard to our other senses, were our ideas of the differences equally clear. Something like this is universally acknowledged with regard to a critical and accurate perception and judgement of the objects of sight; though by a familiar metaphor,

these sensations are transferred to a sense that has no connection with them. Thus a greater capacity of perceiving the beauties of painting, architecture, &c. is called a fine taste, when it should rather be stiled a fine sight.

EARL, [*eorl*, Sax. *coryl*, Erse,] a title of nobility, anciently the highest of this nation, now the third. An earl ranks between a marquis and a viscount. The title is so ancient, that its original can scarcely be traced out. This, however, is certain, that among the Saxons they were called ealdormen, quasi elder men, signifying the same with senior or senator among the Romans; and also schiremen, because they had each the civil government of a division or shire. On the irruption of the Danes they changed their names to eorles, which, according to Camden, signified the same in their language. In Latin they are called comites (a title first used in the empire,) from being the king's companions and associates. After the Norman conquest they were for some time called counts, from the French; but they did not long retain that name, though their shires are thence called counties, and their wives countesses, to this day. It is now become a mere title; they have nothing to do with the government of the county; which is now entirely devolved on the sheriff, the earl's deputy, or vicecomes. In writs, commissions, and other formal instruments, the king, when he mentions any peer of the degree of an earl, usually styles him "trusty and well-beloved cousin;" an appellation as ancient as the reign of Henry IV.; who being either by his wife, mother, or sisters, actually related or allied to every earl in the kingdom, artfully acknowledged that connection in all his letters and other public acts: whence the usage has descended to his successors, though the reason has long ago failed. An earl is created by cincture of sword, mantle of state put upon him by the king himself, a cap and a coronet put upon his head, and a charter in his hand.

EARL MARSHAL. See **MARSHAL**.

EARNEST, a part of the price paid in advance to bind parties to the performance of a verbal agreement. The party is then obliged to abide by his bargain, and is not discharged upon forfeiting his earnest, but may be sued for the whole money stipulated, and damages; and by the statute of frauds 29, c. c. 3, no contract for sale of goods not to be delivered immediately to the value of 10l. or more, is valid, unless contract be made by the parties, or those lawfully authorized by them, or earnest is given.

EAR-PICK, an instrument of ivory, silver, or other metal, somewhat in form of a probe, sharp at one end, and hollow at the other, for cleansing the ear.

EAR-RING, in the sea language, is that part of the bolt-rope which at the four corners of the sail is left open, in the shape of a ring. The two uppermost parts are put over the ends of the yard-arms, and so the sail is made fast to the yard; and into the lowermost ear-rings, the sheets and tacks are seized or bent at the clew.

EARSE LANGUAGE. See **GAELIC**.

EARTH, in astronomy, geography, and geology, the globe which we inhabit, being one of the primary planets. See **ASTRONOMY**, **GEOGRAPHY**, and **GEOLOGY**.

EARTH, MOTIONS, REVOLUTIONS, VELOCITY, DENSITY, &c. OF THE. See **ASTRONOMY**.
